About CertyIQ

We here at CertyIQ eventually got enough of the industry's greedy exam paid for. Our team of IT professionals comes with years of experience in the IT industry Prior to training CertIQ we worked in test areas where we observed the horrors of the paywall exam preparation system.

The misuse of the preparation system has left our team disillusioned. And for that reason, we decided it was time to make a difference. We had to make In this way, CertyIQ was created to provide quality materials without stealing from everyday people who are trying to make a living.

Doubt Support

We have developed a very scalable solution using which we are able to solve 400+ doubts every single day with an average rating of 4.8 out of 5.

★★★★★

Thanks a lot for this updated AZ-900 Q&A. I just passed my exam and got 974, I followed both of your Az-900 videos and the 6 PDF, the PDFs are very much valid, all answers are correct. Could you please create a similar video/PDF for DP900, your content/PDF's is really awesome. The team did a really good job. Thank You 😊.

Ahamed Shibly

★★★★★

Simple easy to understand explanations. To anyone out there wanting to write AZ900, I highly recommend 6 PDF's.Thank you so much, appreciate all your hard work in having such great content. Passed my exam Today - 3 September with 942 score.

Microsoft

(AZ-900)

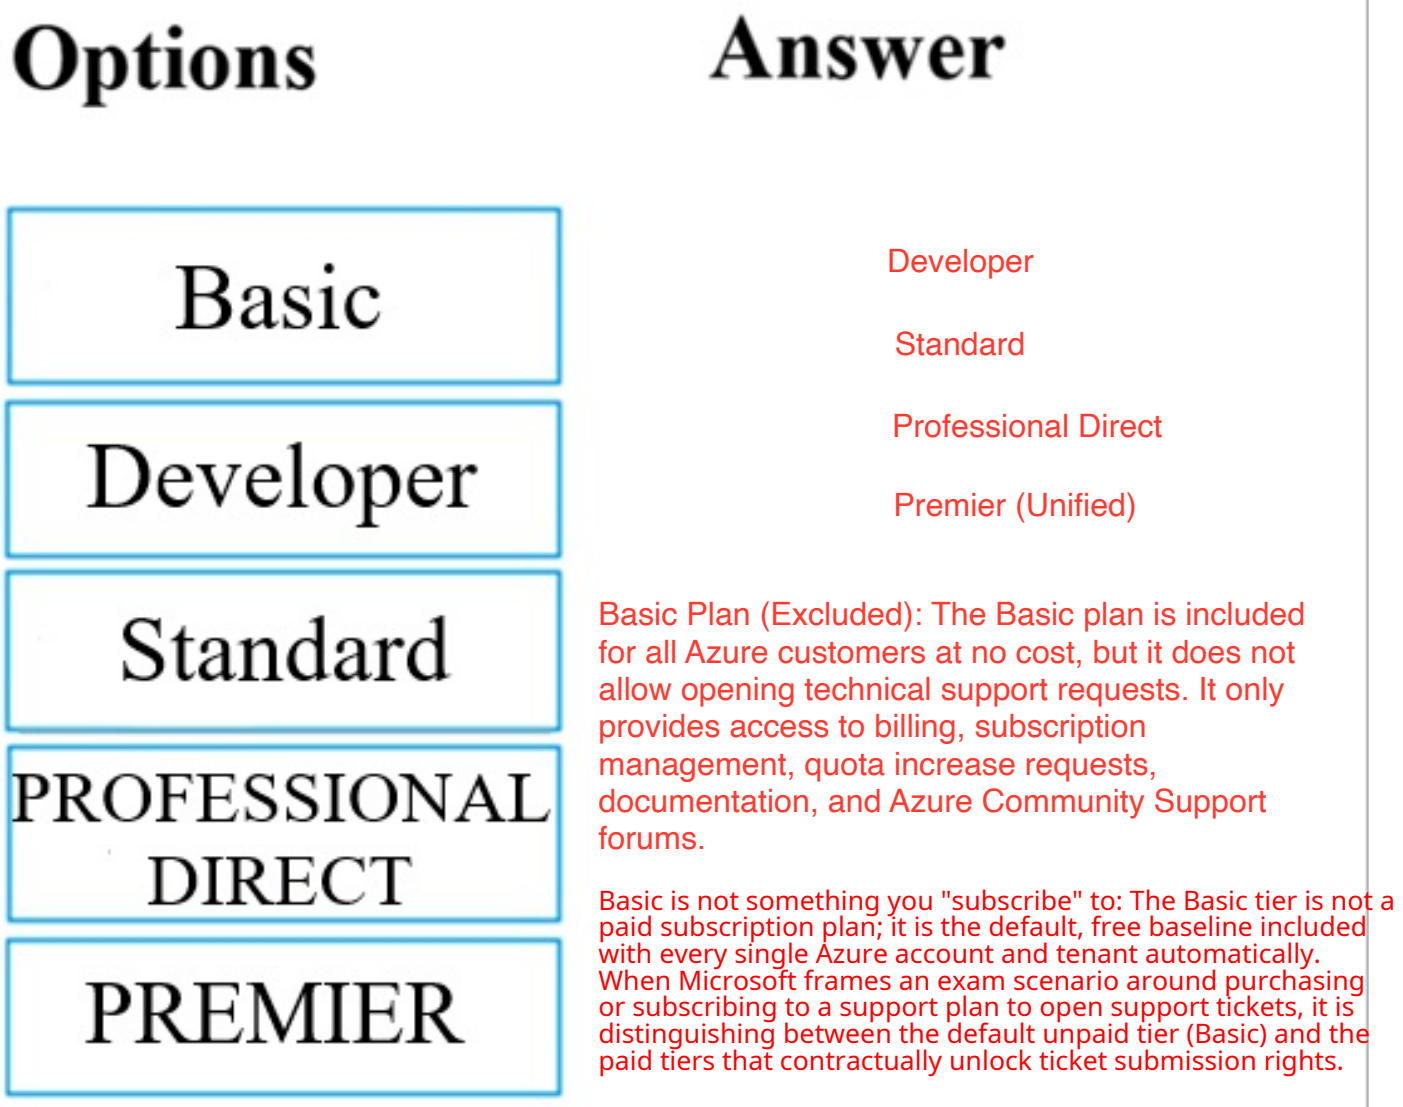
Microsoft Azure Fundamentals

Total: **474 Questions**

Link: https://certyiq.com/papers/microsoft/az-900

Question: 1 CertyIQ

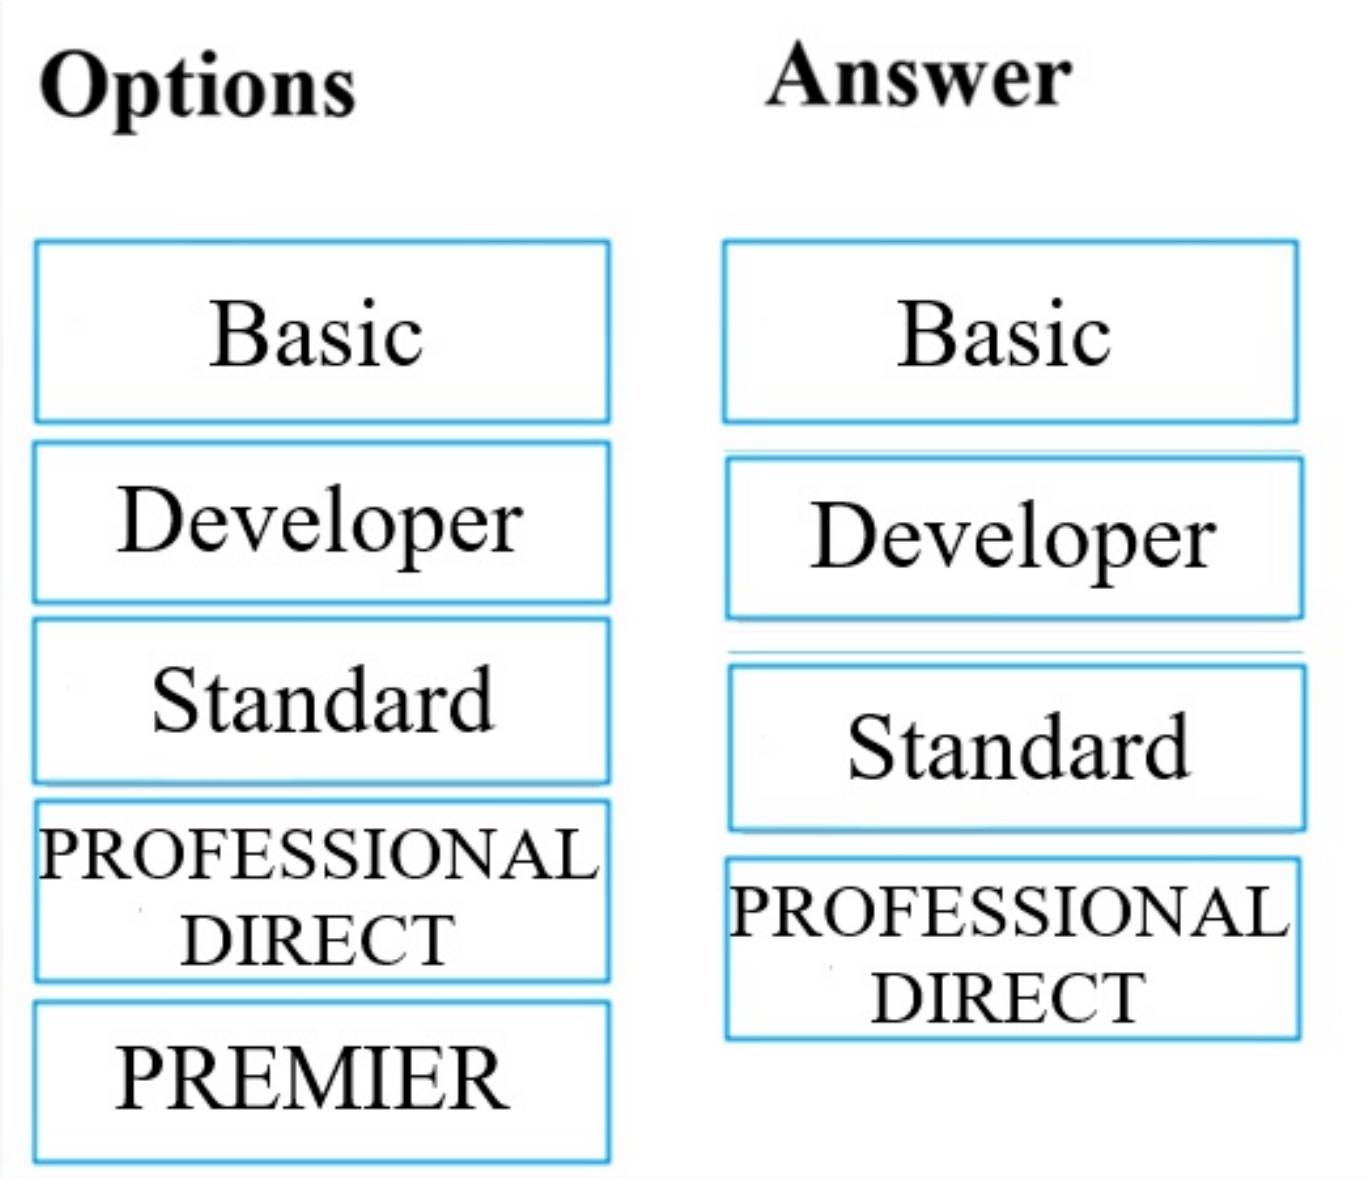
DRAG DROP -
Your company intends to subscribe to an Azure support plan.
The support plan must allow for new support requests to be opened.
Which of the following are support plans that will allow this? Answer by dragging the correct option from the list to the answer area.
Select and Place:



Basic Plan (Excluded): The Basic plan is included for all Azure customers at no cost, but it does not allow opening technical support requests. It only provides access to billing, subscription management, quota increase requests, documentation, and Azure Community Support forums.

Basic is not something you "subscribe" to: The Basic tier is not a paid subscription plan; it is the default, free baseline included with every single Azure account and tenant automatically. When Microsoft frames an exam scenario around purchasing or subscribing to a support plan to open support tickets, it is distinguishing between the default unpaid tier (Basic) and the paid tiers that contractually unlock ticket submission rights.

Answer:



Explanation:

Basic: This is listed twice, suggesting it might be a basic tier or level of service.

Developer: Also listed twice, possibly indicating a tier tailored for developers.

Standard: Listed twice, likely representing a standard level of service or features.

PROFESSIONAL DIRECT: Listed twice, possibly indicating a higher tier with more advanced features.

Listed twice, which might refer to a direct service or access level.

Question: 2 CertyIQ

Your company has datacenters in Los Angeles and New York. The company has a Microsoft Azure subscription.
You are configuring the two datacenters as geo-clustered sites for site resiliency.
You need to recommend an Azure storage redundancy option.
You have the following data storage requirements:
- Data must be stored on multiple nodes.
- Data must be stored on nodes in separate geographic locations.
- Data can be read from the secondary location as well as from the primary location

Which of the following Azure stored redundancy options should you recommend?

A. Geo-redundant storage

B. Read-only geo-redundant storage

C. Zone-redundant storage

D. Locally redundant storage

RA-GRS (Read-access geo-redundant storage) provides the exact same geographic replication as GRS, but additionally exposes a secondary read-only endpoint

Answer: B

Explanation:

GRS (Geo-redundant storage) replicates data synchronously three times within a single physical location in the primary region using LRS, then replicates asynchronously to a single physical location in the secondary paired region (providing six total copies across two regions). However, with standard GRS, data in the secondary region is not accessible for read operations unless Microsoft initiates a failover or customer-managed failover is triggered.

RA-GRS allows you to have higher read availability for your storage account by providing read only access to the data replicated to the secondary location. Once you enable this feature, the secondary location may be used to achieve higher availability in the event the data is not available in the primary region. This is an

opt-in feature which requires the storage account be geo-replicated.

References:

https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy-grs#read-access-geo-redundant-storage

Question: 3 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's Azure subscription includes a Basic support plan.
They would like to request an assessment of an Azure environment's design from Microsoft. This is, however, not supported by the existing plan.
You want to make sure that the company subscribes to a support plan that allows this functionality, while keeping expenses to a minimum.
Solution: You recommend that the company subscribes to the Professional Direct support plan.
Does the solution meet the goal?

A. Yes

B. No

Professional Direct (ProDirect): Adds access to Architectural Guidance delivered by Azure specialist teams (e.g., design assessments, best practices reviews based on the Azure Well-Architected Framework), pooled delivery managers, and operational support.

Enterprise (Unified / Premier): Offers full end-to-end designated Technical Account Managers and custom architectural assessments, but at an enterprise-scale cost.

Answer: B

Explanation:

B. No.

The Standard support plan would be the more cost-effective option compared to the Professional Direct plan for this specific requirement. The Standard plan includes support for design assessments and is generally less expensive than the Professional Direct plan.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Question: 4 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying Azure virtual machines for your company.
You need to make use of the appropriate cloud deployment solution.

Solution: You should make use of Software as a Service (SaaS).
Does the solution meet the goal?

A. Yes
B. No

Answer: B

Explanation:

Key word (Virtual Machine), then we should go with IaaS

Question: 5 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying Azure virtual machines for your company.
You need to make use of the appropriate cloud deployment solution.
Solution: You should make use of Platform as a Service (PaaS).
Does the solution meet the goal?

A. Yes
B. No

Answer: B

Explanation:

B. No - VMs are deployed in IaaS.

Refer: https://docs.microsoft.com/en-us/learn/modules/fundamental-azure-concepts/categories-of-cloud-services

Text to refer under IaaS : "Azure virtual machines are fully operational virtual compute devices running in Microsoft datacenters."

Question: 6 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying Azure virtual machines for your company.
You need to make use of the appropriate cloud deployment solution.
Solution: You should make use of Infrastructure as a Service (IaaS).
Does the solution meet the goal?

A. Yes
B. No

Answer: A

Explanation:

Virtual Machines and Azure storage accounts is IaaS

Question: 7 CertyIQ

Your developers have created 10 web applications that must be host on Azure.
You need to determine which Azure web tier plan to host the web apps. The web tier plan must meet the following requirements:
- The web apps will use custom domains.
- The web apps each require 10 GB of storage.
- The web apps must each run in dedicated compute instances.
- Load balancing between instances must be included.
- Costs must be minimized.

Which web tier plan should you use?

A. Standard
B. Basic
C. Free
D. Shared

Basic Tier: Runs on dedicated Azure VMs and supports custom domains, but it does not support auto-scale or traffic routing/load balancing between instances, and offers a maximum of only 10 GB total storage per plan (which cannot satisfy 10 web apps needing 10 GB each).

Standard Tier: Runs on dedicated compute instances, supports up to 50 GB (historically) or 250 GB total storage across apps, supports custom domains and SSL, and natively includes scale-out capabilities (up to 10 instances) with integrated Azure load balancing between instances.

Answer: A

Explanation:

Please read the requirements: Please note here the load balancing fact:

The web apps will use custom domains. (Basic, Shared and standard Support custom domain)
The web apps each require 10 GB of storage. (basic and standard support this)
The web apps must each run in dedicated compute instances.(basic support 3 instance max where standard support 10max)
Load balancing between instances must be included. (free, shared and basic dont support load balancing. standard and above tier only support load balancing/autoscaling)
Costs must be minimized. Standard is less costlier than premium and isolated.

I hope this is clear to chose the correct answer as STANDARD.

https://azure.microsoft.com/en-us/pricing/details/app-service/windows/

Question: 8 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are planning to migrate a company to Azure. Each of the company's numerous divisions will have an administrator in place to manage the Azure resources used by their respective division.
You want to make sure that the Azure deployment you employ allows for Azure to be segmented for the divisions, while keeping administrative effort to a minimum.
Solution: You plan to make use of several Azure Active Directory (Azure AD) directories.
Does the solution meet the goal?

A. Yes
B. No

To segment access and delegate administrative permissions across divisions with minimal administrative effort, Microsoft recommends using Azure Role-Based Access Control (Azure RBAC) scoped at the Subscription or Resource Group level (or organized under Management Groups), all trusted by a single Entra tenant.

Answer: B

Explanation:

The proposed solution is: You plan to make use of several Azure Active Directory (Azure AD) directories.

I think the key word is SEVERAL. Why in the world a company will create SEVERAL AADs when it can create a single AAD and organize its divisions right there?

This is why I consider the correct answer B (No).

Question: 9 CertyIQ

Your developers have created a portal web app for users in the Miami branch office. The web app will be publicly accessible and used by the Miami users to retrieve customer and product information. The web app is currently running in an on-premises test environment.
You plan to host the web app on Azure.
You need to determine which Azure web tier plan to host the web app. The web tier plan must meet the following requirements:
- The website will use the miami.weyland.com URL.
- The website will be deployed to two instances.
- SSL support must be included.
- The website requires 12 GB of storage.
- Costs must be minimized.

Which web tier plan should you use?

A. Standard
B. Basic
C. Free
D. Shared

Answer: A

Explanation:

keyword 12 GB

Free = 1 GB

Shared = 1 GB

Basic = 10 GB

Standard = 50 GB

Premium = 250 GB

Isolated = 1 TB

https://azure.microsoft.com/en-us/pricing/details/app-service/windows/

References:

http://azure.microsoft.com/en-us/documentation/articles/azure-subscription-service-limits/

Question: 10 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company is planning to migrate all their virtual machines to an Azure pay-as-you-go subscription. The virtual machines are currently hosted on the Hyper-V hosts in a data center.
You are required make sure that the intended Azure solution uses the correct expenditure model.
Solution: You should recommend the use of the elastic expenditure model.
Does the solution meet the goal?

A. Yes
B. No

Capital Expenditure (CapEx): The upfront spending of money on physical infrastructure (e.g., buying physical servers, storage arrays, network switches, data center facilities) and deducting that expense on your tax bill over time. The company's on-premises Hyper-V deployment is a typical CapEx model.

Operational Expenditure (OpEx): Spending money on services or products now and being billed for them continuously as they are consumed (pay-as-you-go, subscription pricing, recurring monthly/annual billing) with no upfront hardware purchase.

An Azure pay-as-you-go subscription operates strictly on the Operational Expenditure (OpEx) model.

Answer: B

Explanation:

Elasticity is not an expenditure model rather is one of the characteristics of could computing.

https://azure.microsoft.com/en-us/overview/what-is-elastic-computing/

The basic advantage of cloud computing is shifting your high Capital Expenditure (CAPEX) requirements to optimal Pay -As-You-Go model which is Operational Expenditure (OPEX)

https://azure.microsoft.com/en-us/pricing/purchase-options/pay-as-you-go/

Question: 11 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company is planning to migrate all their virtual machines to an Azure pay-as-you-go subscription. The virtual machines are currently hosted on the Hyper-V hosts in a data center.
You are required make sure that the intended Azure solution uses the correct expenditure model.
Solution: You should recommend the use of the scalable expenditure model.
Does the solution meet the goal?

A. Yes
B. No

Answer: B

Explanation:

Answer is NO. Because we have two expenditure models. One is Cap-Ex, another is Op-Ex. So Scalable Expenditure is not the right answer.

Question: 12 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company is planning to migrate all their virtual machines to an Azure pay-as-you-go subscription. The virtual machines are currently hosted on the Hyper-V hosts in a data center.
You are required make sure that the intended Azure solution uses the correct expenditure model.

Solution: You should recommend the use of the operational expenditure model.
Does the solution meet the goal?

A. Yes
B. No

Operational Expenditure (OpEx): Spending money on services or products continuously as they are consumed, with no upfront purchase costs. You pay for computing resources, storage, and networking on an ongoing basis (such as monthly pay-as-you-go billing) and deduct these operational costs within the same tax accounting period.Capital Expenditure (CapEx): Spending money upfront on physical assets (servers, storage arrays, network switches, cooling, real estate) and amortizing the cost over its useful lifespan.Moving from on-premises Hyper-V hosts (CapEx) to an Azure pay-as-you-go subscription transitions IT spending directly into the Operational Expenditure (OpEx) model.

Answer: A

Explanation:

Answer is Yes.

Operating expenditures are ongoing costs of doing business. Consuming cloud services in a pay-as-you-go model could qualify as an operating expenditure.

https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/strategy/business-outcomes/fiscal-outcomes

Question: 13 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are required to deploy an Artificial Intelligence (AI) solution in Azure.
You want to make sure that you are able to build, test, and deploy predictive analytics for the solution.
Solution: You should make use of Azure Cosmos DB.
Does the solution meet the goal?

A. Yes
B. No

Azure Machine Learning (Azure ML): The dedicated cloud service for building, training, evaluating, testing, and deploying machine learning models and predictive analytics solutions at scale.

Answer: B

Explanation:

Machine Learning Studio (classic) is a drag-and-drop tool you can use to build, test, and deploy predictive analytics solutions

Azure Cosmos DB is a fully managed NoSQL database for modern app development.

AI Fits with ML not with Cosmos DB so ANs B

Question: 14 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's Active Directory forest includes thousands of user accounts.
You have been informed that all network resources will be migrated to Azure. Thereafter, the on-premises data center will be retired.
You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.
Solution: You plan to sync all the Active Directory user accounts to Azure Active Directory (Azure AD).
Does the solution meet the goal?

A. Yes

B. No

When migrating enterprise workloads from an on-premises Active Directory Domain Services (AD DS) environment to Azure, synchronizing identities via Microsoft Entra Connect Sync (or Cloud Sync) brings existing identities, security groups, and password hashes into the cloud.

This allows end users to continue logging in using their familiar credentials (Same Sign-On or Seamless Single Sign-On) without needing newly provisioned usernames or password resets.

Answer: A

Explanation:

Once the on-premises infrastructure is decommissioned, synced identities can be cut over to cloud-managed identities in Microsoft Entra ID without re-creating accounts from scratch.

Use Azure AD Connect to do this.

Question: 15 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are required to deploy an Artificial Intelligence (AI) solution in Azure.
You want to make sure that you are able to build, test, and deploy predictive analytics for the solution.
Solution: You should make use of Azure Machine Learning Studio.
Does the solution meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

Machine Learning Studio (classic) is a drag-and-drop tool you can use to build, test, and deploy predictive analytics solutions.

https://docs.microsoft.com/bs-cyrl-ba/azure/machine-learning/classic/

Question: 16 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.
The resources required by each business unit are identical.
You are required to sanction a strategy to create Azure resources automatically.
Solution: You recommend that the Azure API Management service be included in the strategy.
Does the solution meet the goal?

A. Yes
B. No

Azure Resource Manager (ARM) Templates / Azure Bicep: The native Infrastructure-as-Code (IaC) solution used to define, automate, and repeatedly deploy identical sets of Azure resources consistently across business units, resource groups, or subscriptions.

Answer:

B

Explanation:

Azure API Management Service i(APIM) is a way to create and manage customer APIs for existing backend

services. The Question is asking about a way to create Azure resources automatically (on the fly). ARM (Azure Resource Manager) is a tool that automates the deployments on the AZ cloud.

Question: 17 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.
The resources required by each business unit are identical.
You are required to sanction a strategy to create Azure resources automatically.
Solution: You recommend that management groups be included in the strategy.
Does the solution meet the goal?

A. Yes
B. No

Azure Resource Manager (ARM) Templates / Azure Bicep: The native Infrastructure-as-Code (IaC) solution used to define, automate, and repeatedly deploy identical sets of Azure resources consistently across business units, resource groups, or subscriptions.

Answer: B

Explanation:

B is correct. It should be ARM template.

https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

To meet these challenges, you can automate deployments and use the practice of infrastructure as code. In code, you define the infrastructure that needs to be deployed. The infrastructure code becomes part of your project. Just like application code, you store the infrastructure code in a source repository and version it. Any one on your team can run the code and deploy similar environments.

Question: 18 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.
The resources required by each business unit are identical.
You are required to sanction a strategy to create Azure resources automatically.
Solution: You recommend that the Azure Resource Manager templates be included in the strategy.
Does the solution meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

To meet these challenges, you can automate deployments and use the practice of infrastructure as code. In

code, you define the infrastructure that needs to be deployed. The infrastructure code becomes part of your project. Just like application code, you store the infrastructure code in a source repository and version it. Any one on your team can run the code and deploy similar environments.

Question: 19 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying a critical LOB application, which will be installed on a virtual machine, to Azure.
You are informed that the application deployment strategy should allow for a guaranteed availability of 99.99 percent. You need to make sure that the strategy requires as little virtual machines and availability zones as possible.
Solution: You include two virtual machines and one availability zone in your strategy.
Does the solution meet the goal?

A. Yes
B. No

Single Instance VM: Provides up to 99.9% SLA (when configured with Premium SSD or Ultra Disk).

Availability Sets (2+ VMs): Provides 99.95% SLA (protects against local hardware/rack faults and planned updates within a single datacenter).

Availability Zones: To achieve Microsoft's highest SLA of 99.99%, you must deploy two or more VM instances across two or more Availability Zones within the same region.

Answer: B

Explanation:

Answer is NO

For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.99% of the time.

For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.

References:

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 20 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying a critical LOB application, which will be installed on a virtual machine, to Azure.
You are informed that the application deployment strategy should allow for a guaranteed availability of 99.99 percent. You need to make sure that the strategy requires as little virtual machines and availability zones as possible.
Solution: You include one virtual machine and two availability zones in your strategy.
Does the solution meet the goal?

A. Yes
B. No

Single Instance VM: Provides up to 99.9% SLA (when configured with Premium SSD or Ultra Disk).

Availability Sets (2+ VMs): Provides 99.95% SLA (protects against local hardware/rack faults and planned updates within a single datacenter).

Availability Zones: To achieve Microsoft's highest SLA of 99.99%, you must deploy two or more VM instances across two or more Availability Zones within the same region.

Answer: B

Explanation:

The answer is NO.

https://docs.microsoft.com/en-us/azure/architecture/framework/services/compute/virtual-machines/operational-excellence

95% SLA for single instance virtual machines using Standard HDD-Managed Disks for OS and Data disks.

99.5% SLA for single instance virtual machines using Standard SSD-Managed Disks for OS and Data disks.

99.9% SLA for single instance virtual machines using Premium SSD or Ultra Disk for all OS and Data disks.

99.95% SLA for all virtual machines that have two or more instances in the same Availability Set or Dedicated Host Group.

99.99% SLA for all virtual machines that have two or more instances deployed across two or more Availability Zones in the same region.

References:

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 21 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying a critical LOB application, which will be installed on a virtual machine, to Azure.
You are informed that the application deployment strategy should allow for a guaranteed availability of 99.99 percent. You need to make sure that the strategy requires as little virtual machines and availability zones as possible.
Solution: You include two virtual machines and two availability zones in your strategy.
Does the solution meet the goal?

A. Yes
B. No

Single Instance VM: Provides up to 99.9% SLA (when configured with Premium SSD or Ultra Disk).

Availability Sets (2+ VMs): Provides 99.95% SLA (protects against local hardware/rack faults and planned updates within a single datacenter).

Availability Zones: To achieve Microsoft's highest SLA of 99.99%, you must deploy two or more VM instances across two or more Availability Zones within the same region.

Answer:

A

Explanation:

2VMs + 2 Zones equal great fail over and 99.9% uptime

For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.99% of the time.

For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.

For any Single Instance Virtual Machine using Premium SSD or Ultra Disk for all Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.9%.

For any Single Instance Virtual Machine using Standard SSD Managed Disks for Operating System Disk and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.5%.

For any Single Instance Virtual Machine using Standard HDD Managed Disks for Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 95%.

References:

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 22 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.
You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.
Solution: You recommend the use of Microsoft Managed Desktop.
Does the solution meet the goal?

A. Yes
B. No

Azure DevTest Labs: The purpose-built Azure service designed specifically for developers to quickly self-provision pre-configured Windows and Linux virtual machines using custom images, formulas, and artifacts, with automated shutdown and expiration policies to automatically discard VMs when done.

Answer: B

Explanation:

Answer correct. It is not Microsoft Managed Desktop. The correct answer should be Azure DevTest Labs.

Welcome to Microsoft Managed Desktop

Microsoft Managed Desktop brings together Microsoft 365 Enterprise, cloud-based device management by Microsoft, and security monitoring, enabling you to free your IT team to focus on core business needs. Currently, the Microsoft Managed Desktop service is offered only by invitation. Learn more on Microsoft docs or contact your Microsoft account manager. If you're unfamiliar with Microsoft Managed Desktop, learn more about the service.

Question: 23 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.
You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.
Solution: You recommend the use of Azure Reserved Virtual Machines (VM) Instances.
Does the solution meet the goal?

A. Yes
B. No

Azure Reservations (Reserved VM Instances): A pricing commitment model where you commit to a one-year or three-year plan for compute resources in exchange for significant billing discounts compared to pay-as-you-go rates. Reserved Instances are purely a cost-saving billing mechanism for stable, predictable, long-running production workloads. They do not automate VM provisioning, configuration, or lifecycle de-provisioning.

Answer: B

Azure DevTest Labs: The purpose-built service designed to reduce administrative overhead when provisioning and automatically tearing down transient, short-lived development and testing environments (featuring reusable custom images, artifacts, and auto-shutdown/auto-delete policies).

Explanation:

The correct answer is B.

Azure DevTest Labs enable you to quickly create environments using reusable templates and artifacts.

Reserved not a tool, it is a method pricing

Question: 24 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.
You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.
Solution: You recommend the use of Azure DevTest Labs.
Does the solution meet the goal?

A. Yes
B. No

Azure DevTest Labs: The purpose-built service designed to reduce administrative overhead when provisioning and automatically tearing down transient, short-lived development and testing environments (featuring reusable custom images, artifacts, and auto-shutdown/auto-delete policies).

Answer: A

Explanation:

Use DevTest Labs for free*

Quickly provision development and test environments

Minimize waste with quotas and policies

Set automated shutdowns to minimize costs

Build Windows and Linux environments

Question: 25 CertyIQ

Your company has virtual machines (VMs) hosted in Microsoft Azure. The VMs are located in a single Azure virtual network named VNet1.
The company has users that work remotely. The remote workers require access to the VMs on VNet1.
You need to provide access for the remote workers.
What should you do?

A. Configure a Site-to-Site (S2S) VPN.
B. Configure a VNet-toVNet VPN.
C. Configure a Point-to-Site (P2S) VPN.
D. Configure DirectAccess on a Windows Server 2012 server VM.
E. Configure a Multi-Site VPN

Point-to-Site (P2S) VPN: Enables a secure encrypted tunnel from an individual client computer back to an Azure virtual network. It is specifically intended for telecommuters, mobile workers, and remote employees connecting from home or external locations without requiring an on-premises VPN hardware appliance.

Site-to-Site (S2S) VPN: Connects an entire on-premises branch office or corporate data center network to an Azure VNet via an edge VPN gateway device, not individual mobile client endpoints.

Answer: C

Explanation:
A Point-to-Site (P2S) VPN gateway connection lets you create a secure connection to your virtual network from an individual client computer.

Reference:
https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-about-vpngateways

Question: 26 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You have been informed by your superiors of the company's intentions to automate server deployment to Azure.
There is, however, some concern that administrative credentials could be uncovered during this process.
You are required to make sure that during the deployment, the administrative credentials are encrypted using a suitable Azure solution.
Solution: You recommend the use of Azure Information Protection.
Does the solution meet the goal?

A. Yes
B. No

Azure Key Vault: The centralized cloud service engineered specifically to securely store, encrypt, and manage application secrets, tokens, passwords, certificates, and API keys. During automated deployments (such as via ARM templates, Bicep, or Terraform), administrative credentials can be retrieved dynamically from Azure Key Vault without being exposed in plaintext scripts or code repositories.

Answer:

B

Explanation:

B. No, answer -> It should be Key Vault

Azure Information Protection (AIP) is a cloud-based solution that enables organizations to discover, classify, and protect documents and emails by applying labels to content.

Question: 27 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You have been informed by your superiors of the company's intentions to automate server deployment to Azure.
There is, however, some concern that administrative credentials could be uncovered during this process.
You are required to make sure that during the deployment, the administrative credentials are encrypted using a suitable Azure solution.
Solution: You recommend the use of Azure Multi-Factor Authentication (MFA).
Does the solution meet the goal?

A. Yes
B. No

Azure Key Vault: The centralized cloud service engineered specifically to securely store, encrypt, and manage application secrets, tokens, passwords, certificates, and API keys. During automated deployments (such as via ARM templates, Bicep, or Terraform), administrative credentials can be retrieved dynamically from Azure Key Vault without being exposed in plaintext scripts or code repositories.

Answer: B

Explanation:

B. No - does not meet goal due to MFA is used to add authentication layer for user access, not to encrypt credentials. Correct solution is Azure Key Vault.

Question: 28 CertyIQ

DRAG DROP -
The company would like to develop a cloud solution by making use of Azure Government. Azure Government can only be used by certain types of clients to develop cloud solutions.
Which of the following are the types of customers that can make use of Azure Government in this situation?
Answer by dragging the correct option from the list to the answer area.
Select and Place:

Options	Answer
A government contractor from any country.	
A government entity from any country.	
A European government contractor.	
A European government entity.	
A United States government contractor.	
A United States government entity.	

A United States government entity.

A United States government contractor.

Concept: Sovereign / Specialized Cloud Offerings (Azure Government).

Under official Microsoft Learn standards:

Azure Government is a dedicated, physically and logically isolated cloud instance designed specifically to meet the stringent security, compliance, and regulatory standards of the United States public sector (such as FedRAMP High, DoD Impact Levels, CJIS, and ITAR).

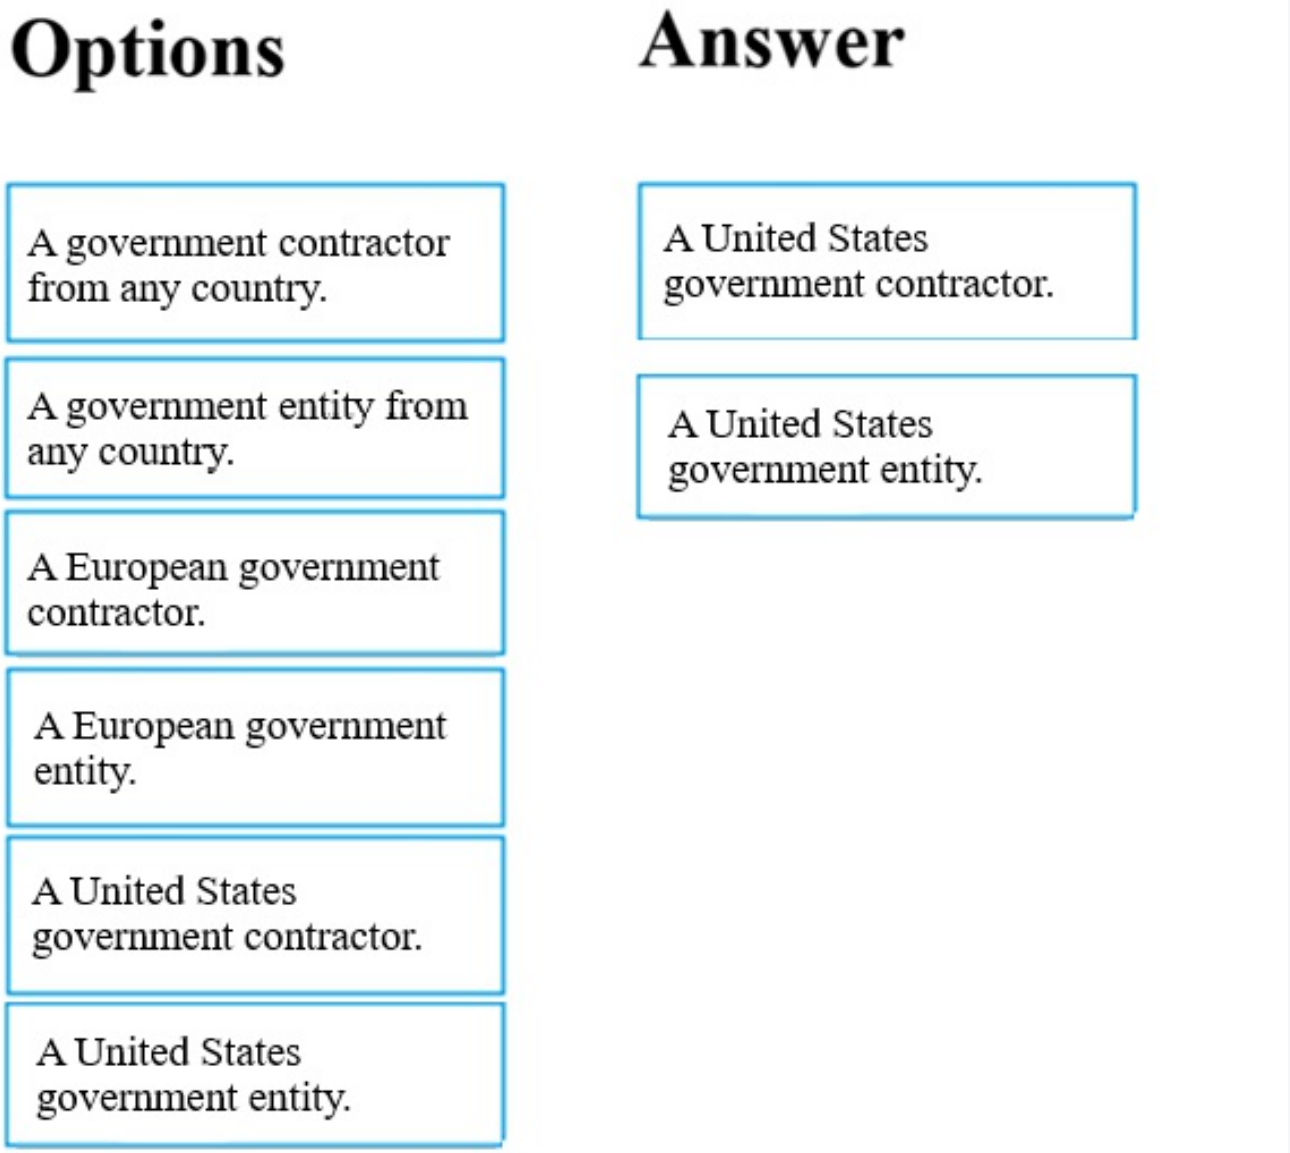
Eligibility is strictly restricted to:

US federal, state, local, and tribal government agencies / entities.

US government commercial contractors and partners who provide solutions and services to authorized US government entities (subject to validation and screening).

Entities from other sovereign nations or international governments are not eligible for Azure Government; they use global Azure regions or their respective sovereign/local instances where available (e.g., Azure China 21Vianet).

Answer:



Explanation:

Azure Government is the mission-critical cloud, delivering breakthrough innovation to US government customers and their partners. Only US federal, state, local, and tribal governments and their partners have access to this dedicated instance. (https://azure.microsoft.com/en-us/global-infrastructure/government/get-started/)

References:

https://docs.microsoft.com/en-us/learn/modules/intro-to-azure-government/2-what-is-azure-government

Question: 29 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company has an Azure Active Directory (Azure AD) environment. Users occasionally connect to Azure AD via the Internet.
You have been tasked with making sure that users who connect to Azure AD via the internet from an unidentified IP address, are automatically encouraged to change passwords.
Solution: You configure the use of Azure AD Identity Protection.
Does the solution meet the goal?

A. Yes

B. No

Microsoft Entra ID Protection utilizes machine learning algorithms and heuristic intelligence to detect anomalies, suspicious sign-in behavior, and potential credential compromises.An unfamiliar sign-in property (such as signing in from an unidentified/new IP address or anonymous IP address) generates a sign-in risk or user risk event.Administrators can configure risk-based remediation policies (such as a User risk policy or Sign-in risk policy via Conditional Access) that automatically trigger a secure password reset and remediation flow when suspicious risk conditions are detected.

Answer: A

Explanation:

Risk detection and remediation

Identity Protection identifies risks of many types, including:

Anonymous IP address use

Atypical travel

Malware linked IP address

Unfamiliar sign-in properties

Leaked credentials

Password spray

References:

https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy

Question: 30

CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company has an Azure Active Directory (Azure AD) environment. Users occasionally connect to Azure AD via the Internet.
You have been tasked with making sure that users who connect to Azure AD via the internet from an unidentified IP address, are automatically encouraged to change passwords.
Solution: You configure the use of Azure AD Privileged Identity Management.
Does the solution meet the goal?

A. Yes

B. No

Privileged Identity Management (PIM): A service that enables organizations to manage, control, and monitor access to critical Azure and Entra resources. It provides just-in-time (JIT) access, time-bound role assignment, approval workflows, and access reviews for highly privileged administrative accounts. It does not monitor external client IP addresses, evaluate user/sign-in risk levels, or automate password resets.

Answer: B

Explanation:

Microsoft Entra ID Protection (formerly Azure AD Identity Protection): The service that flags anomalous or unidentified IP sign-in events using heuristic machine learning and applies automated remediation policies (such as enforcing a self-service password change upon high user risk).

Answer is No

Azure Information Protection (AIP) is a cloud-based solution that enables organizations to discover, classify, and protect documents and emails by applying labels to content.

Solution : Azure Key Vault

Privileged Identity Management provides time-based and approval-based role activation to mitigate the risks of excessive, unnecessary, or misused access permissions on resources that you care about. Here are some of the key features of Privileged Identity Management:

Provide just-in-time privileged access to Azure AD and Azure resources

Assign time-bound access to resources using start and end dates

Require approval to activate privileged roles

Enforce multi-factor authentication to activate any role

Use justification to understand why users activate

Get notifications when privileged roles are activated

Conduct access reviews to ensure users still need roles

Download audit history for internal or external audit

Prevents removal of the last active Global Administrator role assignment

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machines/infrastructure-automation

References:

https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy

Question: 31 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are planning a strategy to deploy numerous web servers and database servers to Azure.
This strategy should allow for connection types between the web servers and database servers to be controlled.
Solution: You include network security groups (NSGs) in your strategy.
Does the solution meet the goal?

A. Yes

B. No

A Network Security Group (NSG) contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources (such as virtual network subnets or individual network interfaces / NICs).

Answer:

A

In a standard multi-tier deployment (e.g., web tier and database tier), an NSG applied to the database subnet can be configured with security rules that restrict traffic so that database ports (e.g., TCP port 1433 for SQL Server) only accept inbound connections originating from the web servers' subnet or an Application Security Group (ASG), while denying all other connection types.

Explanation:

You can use an Azure network security group to filter network traffic to and from Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. For each rule, you can specify source and destination, port, and protocol.

Question: 32 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are planning a strategy to deploy numerous web servers and database servers to Azure.
This strategy should allow for connection types between the web servers and database servers to be controlled.

Solution: You include a local network gateway in your strategy.
Does the solution meet the goal?

A. Yes
B. No

A Local Network Gateway is an Azure resource that represents your on-premises physical location (edge device) in a Site-to-Site (S2S) VPN connection. It defines the on-premises gateway's public IP address and local IP address prefixes/subnets so Azure knows where to route hybrid cross-premises traffic.

A local network gateway cannot filter, inspect, permit, or deny connection types or protocols between workloads deployed inside Azure virtual networks.

Answer: B

Explanation: Controlling connection types and network protocols between internal web and database tiers requires Network Security Groups (NSGs) or Application Security Groups (ASGs).

B. No - the local NG is to connect between local and virtual networks (or VPN for private access). The Network Security Group would meet the goal.

Question: 33 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's Active Directory forest includes thousands of user accounts.
You have been informed that all network resources will be migrated to Azure. Thereafter, the on-premises data center will be retired.
You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.
Solution: You plan to require Azure Multi-Factor Authentication (MFA).
Does the solution meet the goal?

A. Yes
B. No

The objective is to reduce the disruption and effect on end users when transitioning thousands of accounts from an on-premises Active Directory forest to Azure. The standard method to achieve this is synchronizing accounts via Microsoft Entra Connect (Azure AD Connect) so users retain their existing credentials, UPNs, and passwords.

Answer: B

Explanation: Azure Multi-Factor Authentication (MFA): A security control that adds a second form of verification (e.g., authenticator app prompt, SMS, or FIDO2 key) during sign-in. While MFA enhances security, it does nothing to migrate or preserve account identities, and requiring it actually adds a step to the user sign-in flow rather than minimizing migration disruption

MFA is not going to help reduce the issues with users. It will tighten security but what you really need here is Azure Sync to AAD

"You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.". Multi-factor authentication doesn't reduce the effect or have any kind of effect on this issue. MFA is used to verify the reinforce the security to identify a user, but it doesn't help at all in arranging the user's accounts

Question: 34 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Operating System Management (Statement 1): In a PaaS offering (such as Azure App Service), the cloud service provider manages the operating system, hardware, virtualization layer, OS patching, and network infrastructure.

Automatic Scaling (Statement 2): PaaS web hosting in Azure natively features Autoscale capabilities. You can configure rules to automatically scale compute instances in and out based on demand metrics

Development Services (Statement 3): Azure PaaS provides hosting infrastructure, application runtimes, and developer tooling (e.g., CI/CD integration, deployment slots, SDKs). It does not provide human software developers or managed professional consulting services to write or continuously build business features for your custom application.

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	○
A platform as a service (PaaS) solution that hosts web apps in Azure provides the ability to scale the platform automatically.	○	○
A platform as a service (PaaS) solution that hosts web apps in Azure provides professional development services to continuously add features to custom applications.	○	○

Answer:

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	●
A platform as a service (PaaS) solution that hosts web apps in Azure provides the ability to scale the platform automatically.	●	○
A platform as a service (PaaS) solution that hosts web apps in Azure provides professional development services to continuously add features to custom applications.	●	○

Explanation:

Box 1: No -

A PaaS solution does not provide access to the operating system. The Azure Web Apps service provides an environment for you to host your web applications.

Behind the scenes, the web apps are hosted on virtual machines running IIS. However, you have no direct access to the virtual machine, the operating system or

IIS.

Box 2: Yes -

A PaaS solution that hosts web apps in Azure does provide the ability to scale the platform automatically. This is known as autoscaling. Behind the scenes, the web apps are hosted on virtual machines running IIS. Autoscaling means adding more load balanced virtual machines to host the web apps.

Box 3: Yes -

PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. PaaS development tools can cut the time it takes to code new apps with pre-coded application components built into the platform, such as workflow, directory services, security features, search and so on.

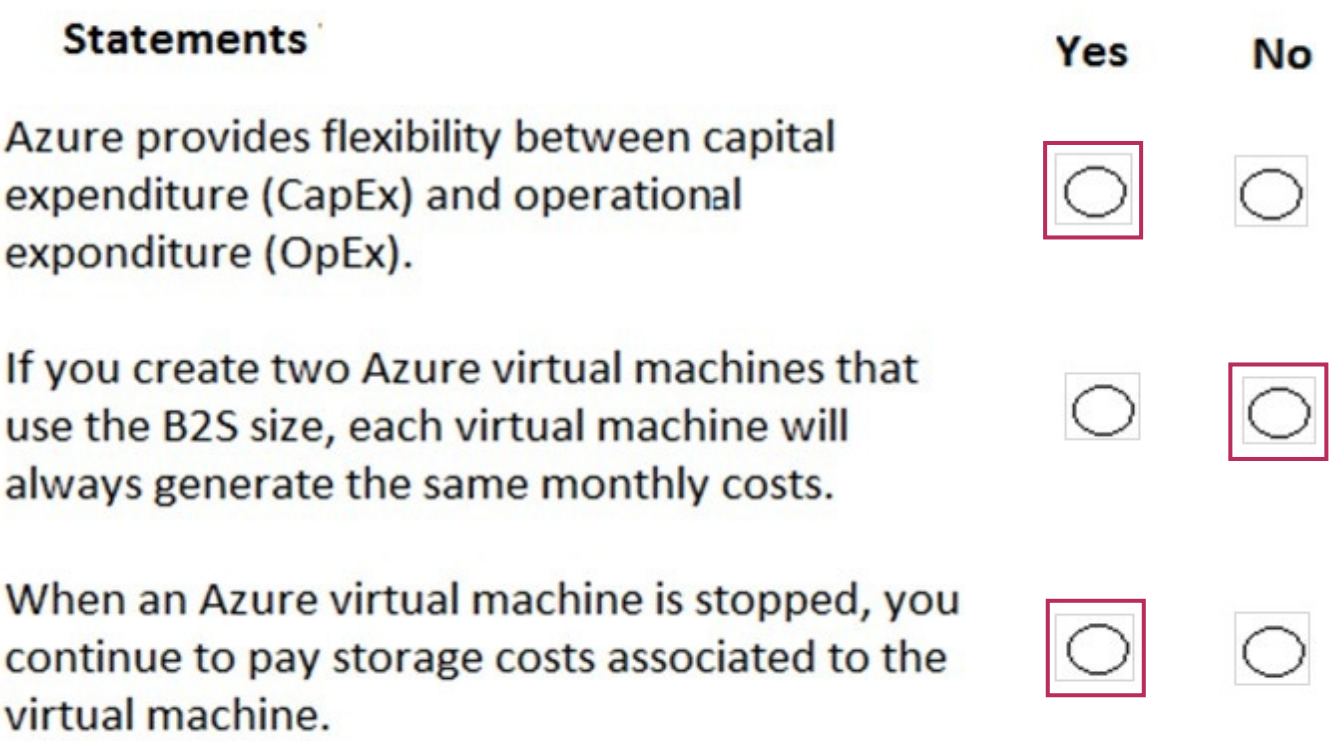
References:

https://azure.microsoft.com/en-gb/overview/what-is-paas/

Question: 35 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area



Statement 1 (CapEx vs. OpEx Flexibility - Yes): While public cloud compute defaults to an OpEx (pay-as-you-go) model, Azure allows organizations to balance CapEx and OpEx based on financial strategy. Organizations can leverage CapEx through upfront commitments like Azure Reserved Virtual Machine Instances (1-year or 3-year single upfront payment) or Azure Hybrid Benefit (applying existing on-premises software capital investments to cloud VMs).

Answer:

Statement 2 (Identical VM Costs - No): The monthly cost of two identical VM sizes (such as B2S) is not fixed or guaranteed to be identical:

Uptime / Runtime hours: If VM A runs 24/7 (730 hours/month) and VM B runs for 20 hours/month, their compute charges differ drastically.

Region: Deploying a B2S VM in East US carries a different hourly rate than deploying the same B2S VM in Brazil South or Australia East.

Storage & Egress Bandwidth: Disks attached (Standard HDD vs. Premium SSD), disk sizes, outbound data transfer, and static public IP assignments all introduce distinct variable monthly costs.

Statement 3 (Storage Costs When VM Stopped - Yes): Stopping/deallocating an Azure virtual machine releases its compute cores and RAM, stopping compute hourly charges. However, the virtual hard disks (OS disk and any attached data disks) remain provisioned in Azure Storage to retain the VM's state and data, continuing to accrue storage capacity costs.

Answer Area

Statements	Yes	No
Azure provides flexibility between capital expenditure (CapEx) and operational exponditure (OpEx).	○	○
If you create two Azure virtual machines that use the B2S size, each virtual machine will always generate the same monthly costs.	○	○
When an Azure virtual machine is stopped, you continue to pay storage costs associated to the virtual machine.	○	○

Explanation:
Box 1: Yes -
Traditionally, IT expenses have been considered a Capital Expenditure (CapEx). Today, with the move to the cloud and the pay-as-you-go model, organizations have the ability to stretch their budgets and are shifting their IT CapEx costs to Operating Expenditures (OpEx) instead. This flexibility, in accounting terms, is now an option due to the as a Service model of purchasing software, cloud storage and other IT related resources.

Box 2: No -
Two virtual machines using the same size could have different disk configurations. Therefore, the monthly costs could be different.

Box 3: Yes -
When an Azure virtual machine is stopped, you don't pay for the virtual machine. However, you do still pay for the storage costs associated to the virtual machine.
The most common storage costs are for the disks attached to the virtual machines. There are also other storage costs associated with a virtual machine such as storage for diagnostic data and virtual machine backups.

https://meritsolutions.com/capex-vs-opex-cloud-computing-blog/

Question: 36 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability.
- defining scalability rules.
- installing the SaaS solution.
- configuring the SaaS solution.

In a SaaS model (e.g., Microsoft 365, Dynamics 365), the cloud service provider provisions, installs, patches, secures, maintains, and ensures high availability/scalability for the underlying infrastructure and software runtime.

The customer's role is strictly limited to managing their data, identities, device access, and configuring application-level settings (such as business rules, role assignments, user access permissions, and feature toggles) within the SaaS environment

Answer:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability.
- defining scalability rules.
- installing the SaaS solution.
- configuring the SaaS solution.

Explanation:

When you are implementing a Software as a Service (SaaS) solution, you are responsible for configuring the SaaS solution. Everything else is managed by the cloud provider.

SaaS requires the least amount of management. The cloud provider is responsible for managing everything, and the end user just uses the software.

Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring and office tools
(such as Microsoft Office 365).

SaaS provides a complete software solution which you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure, middleware, app software and app data are located in the service provider's data center. The service provider manages the hardware and software and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well.

Reference:
https://azure.microsoft.com/en-in/overview/what-is-saas/
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/5-types-of-cloud-services

Question: 37 CertyIQ

You have an on-premises network that contains several servers.
You plan to migrate all the servers to Azure.
You need to recommend a solution to ensure that some of the servers are available if a single Azure data center goes offline for an extended period.
What should you include in the recommendation?

A. fault tolerance
B. elasticity
C. scalability
D. low latency

Fault Tolerance: The ability of a system to remain operational and continue providing service without interruption even when one or more of its underlying hardware, software, or physical datacenter components experience a total failure. Deploying workloads across Azure Availability Zones (separate physical data centers with independent power, cooling, and networking) provides datacenter-level fault tolerance.

While high availability focuses on minimizing overall downtime, fault tolerance specifically describes a design where a complete failure of an entire physical facility (data center) allows services to persist without operational disruption.

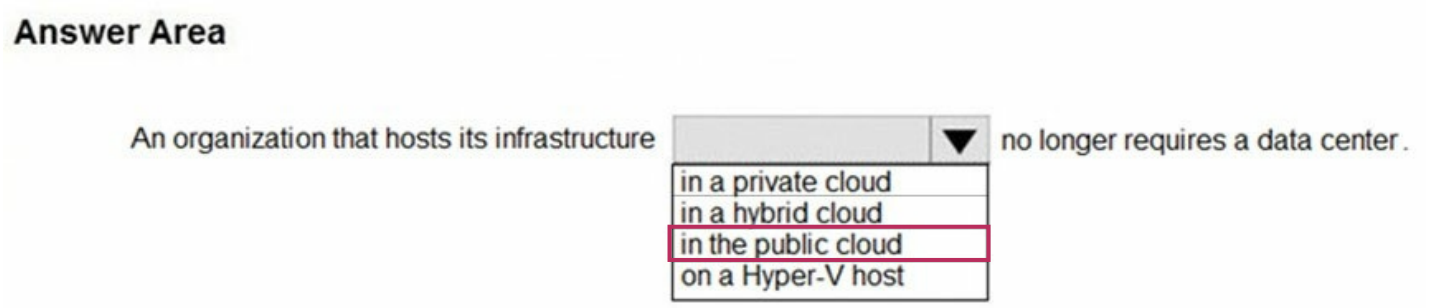
Answer: A

Explanation:
Fault tolerance is the ability of a system to continue to function in the event of a failure of some of its components.
In this question, you could have servers that are replicated across datacenters.
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there are a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures.
With Availability Zones, Azure offers industry best 99.99% VM uptime SLA. By architecting your solutions to use replicated VMs in zones, you can protect your applications and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

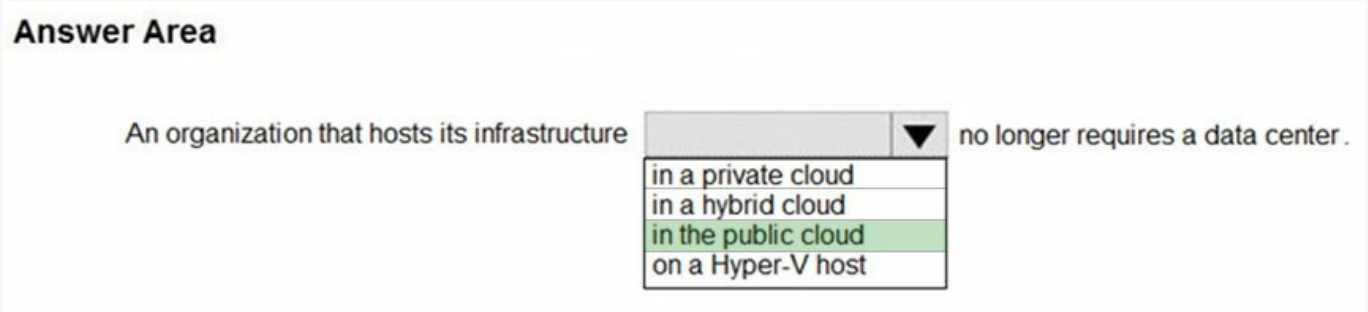
Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/manage-availability

Question: 38 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



Explanation:
A private cloud is hosted in your datacenter. Therefore, you cannot close your datacenter if you are using a private cloud.
A public cloud is hosted externally, for example, in Microsoft Azure. An organization that hosts its

infrastructure in a public cloud can close its data center.
Public cloud is the most common deployment model. In this case, you have no local hardware to manage or keep up-to-date " everything runs on your cloud provider's hardware.
Microsoft Azure is an example of a public cloud provider.
In a private cloud, you create a cloud environment in your own datacenter and provide self-service access to compute resources to users in your organization.
This offers a simulation of a public cloud to your users, but you remain completely responsible for the purchase and maintenance of the hardware and software services you provide.

Reference:
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/4-cloud-deployment-models

Question: 39 CertyIQ

What are two characteristics of the public cloud? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. dedicated hardware
B. unsecured connections
C. limited storage
D. metered pricing
E. self-service management

Metered Pricing (Pay-as-you-go): Public cloud services operate on a consumption-based expenditure model where organizations pay only for the compute cycles, storage gigabytes, and bandwidth consumed (metered usage), eliminating massive upfront capital investments.

Self-Service Management: Consumers provision, configure, monitor, scale, and decommission cloud resources on demand using self-service web portals (Azure Portal), command-line tools (Azure CLI, PowerShell), or automation APIs without requiring manual intervention from the cloud provider's staff.

Answer: DE

Public cloud infrastructure is shared across multiple tenants (multi-tenant shared hardware) owned and maintained entirely by the cloud provider (Microsoft).

Explanation:
With the public cloud, you get pay-as-you-go pricing " you pay only for what you use, no CapEx costs.
With the public cloud, you have self-service management. You are responsible for the deployment and configuration of the cloud resources such as virtual machines or web sites. The underlying hardware that hosts the cloud resources is managed by the cloud provider.
Incorrect Answers:
A: You don't have dedicated hardware. The underlying hardware is shared so you could have multiple customers using cloud resources hosted on the same physical hardware.
B: Connections to the public cloud are secure.
C: Storage is not limited. You can have as much storage as you like.

Reference:
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/4-cloud-deployment-models

Question: 40 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure.
- reduce the number of connections to the website.

Answer:

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure.
- reduce the number of connections to the website.

Explanation:

When planning to migrate a public website to Azure, you must plan to pay monthly usage costs. This is because Azure uses the pay-as-you-go model.

Question: 41 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create an Azure App Service and Azure SQL databases.
Does this meet the goal?

A. Yes
B. No

Azure App Service: A fully managed Platform as a Service (PaaS) hosting environment for web applications, REST APIs, and mobile back ends. Azure manages the operating system, infrastructure patching, network scaling, and web server configuration.

Azure SQL Database: A fully managed PaaS relational database service running on the latest stable Enterprise Edition of the Microsoft SQL Server database engine. Hardware provisioning, OS patching, backups, and high availability are managed automatically by Microsoft.

Answer: A

Explanation: Because both components deployed in the solution (Azure App Service and Azure SQL Database) are classified as PaaS, the solution satisfies the requirement that only PaaS solutions must be used.
Azure App Service and Azure SQL databases are examples of Azure PaaS solutions. Therefore, this solution

does meet the goal.

Question: 42 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create an Azure App Service and Azure virtual machines that have Microsoft SQL Server installed.
Does this meet the goal?

A. Yes
B. No

Azure App Service: A fully managed Platform as a Service (PaaS) hosting environment for web applications, REST APIs, and mobile back ends. Azure manages the operating system, infrastructure patching, network scaling, and web server configuration.

Azure SQL Database: A fully managed PaaS relational database service running on the latest stable Enterprise Edition of the Microsoft SQL Server database engine. Hardware provisioning, OS patching, backups, and high availability are managed automatically by Microsoft.

Answer: B

Explanation: Because both components deployed in the solution (Azure App Service and Azure SQL Database) are classified as PaaS, the solution satisfies the requirement that only PaaS solutions must be used.

1. Azure Disk Storge is IaaS and Azure Blob Storage is PaaS. So it has not mention properly which service the developer used so the answer is no

2. VM = IaaS where App Service I remember as something like Docker which is a PlatformNo would be the correct answer here because of the VM.

Question: 43 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create an Azure App Service and Azure Storage accounts.
Does this meet the goal?

A. Yes
B. No

Azure App Service: A fully managed Platform as a Service (PaaS) engine for building and hosting web apps, mobile app back ends, and RESTful APIs without managing infrastructure or operating systems.

Azure Storage Accounts (Blob, Files, Queues, Tables): Classified by Microsoft as a PaaS offering. Azure abstracts the underlying physical servers, disk hardware, RAID configurations, operating system maintenance, and storage fabric updates. The user manages only their stored data, security keys, access tiers, and permissions.

Answer: B

Explanation: Because both Azure App Service and Azure Storage accounts are PaaS services, deploying them adheres strictly to the requirement that only PaaS solutions are used.

Azure Storage is a PaaS

Azure Storage ACCOUNTS are not. Therefore B, No.

An Azure Storage Account is not IaaS or PaaS because it is not a "service". An Azure Storage Account is a container for one of the Azure storage solutions; Azure Disk Storage(IaaS), Azure Blob Storage(PaaS), and

Azure File Storage(SaaS).

https://docs.microsoft.com/en-us/learn/modules/azure-networking-fundamentals/azure-virtual-network-fundamentals

Question: 44 CertyIQ

Your company hosts an accounting application named App1 that is used by all the customers of the company. App1 has low usage during the first three weeks of each month and very high usage during the last week of each month.
Which benefit of Azure Cloud Services supports cost management for this type of usage pattern?

A. high availability
B. high latency
C. elasticity
D. load balancing

Elasticity: The ability of a cloud platform to dynamically provision and de-provision computing resources automatically (scaling out/in or up/down) in direct response to fluctuating workload demands.

For cyclical or bursty workloads—such as end-of-month accounting reconciliations—elasticity supports cost management by ensuring you only pay for high-capacity compute resources during peak demand (the last week) and automatically scale down to minimal capacity during idle periods (the first three weeks), preventing wasted expenditure on over-provisioned idle infrastructure.

Answer: C

Explanation:
Elasticity in this case is the ability to provide additional compute resource when needed and reduce the compute resource when not needed to reduce costs.
Autoscaling is an example of elasticity.
Elastic computing is the ability to quickly expand or decrease computer processing, memory and storage resources to meet changing demands without worrying about capacity planning and engineering for peak usage. Typically controlled by system monitoring tools, elastic computing matches the amount of resources allocated to the amount of resources actually needed without disrupting operations. With cloud elasticity, a company avoids paying for unused capacity or idle resources and doesn't have to worry about investing in the purchase or maintenance of additional resources and equipment.

Reference:
https://azure.microsoft.com/en-gb/overview/what-is-elastic-computing/

Question: 45 CertyIQ

You plan to migrate a web application to Azure. The web application is accessed by external users.
You need to recommend a cloud deployment solution to minimize the amount of administrative effort used to manage the web application.
What should you include in the recommendation?

A. Software as a Service (SaaS)
B. Platform as a Service (PaaS)
C. Infrastructure as a Service (IaaS)
D. Database as a Service (DaaS)

When migrating an existing custom web application to Azure, Platform as a Service (PaaS) minimizes administrative effort by offloading the operating system, web server runtime (IIS, Apache, NGINX), patching, scaling, and physical hardware management to Microsoft.

The organization only manages the application code and deployment configurations.

Answer: B

Explanation:

The keywords are "migrate" and "administration"

Azure App Service is a platform-as-a-service (PaaS) offering that lets you create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises. App Service includes the web and mobile capabilities that were previously delivered separately as Azure Websites and Azure Mobile

Services.

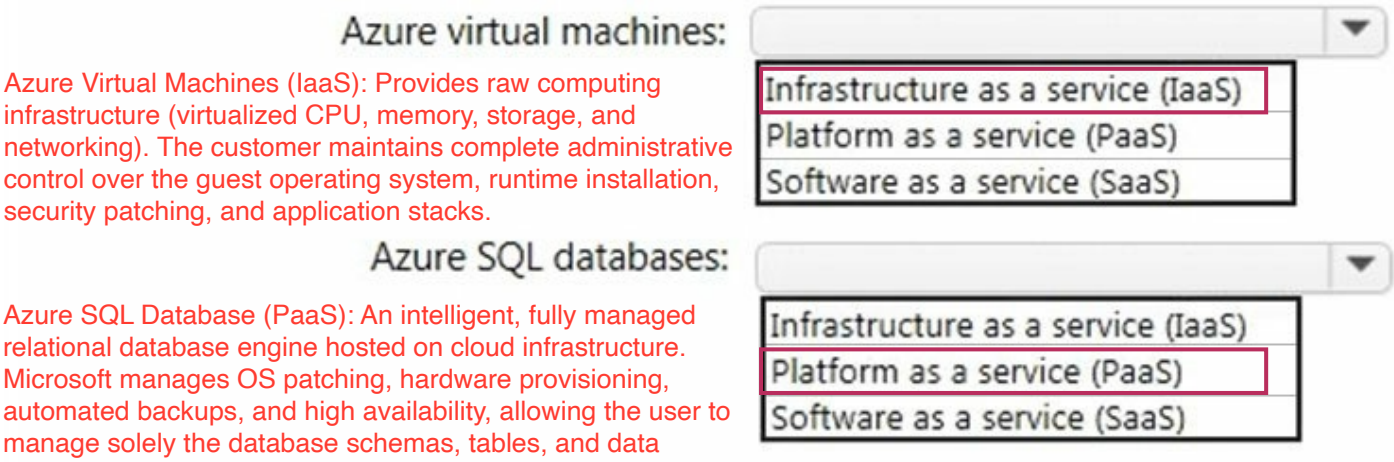
https://docs.microsoft.com/en-us/azure/security/fundamentals/paas-applications-using-app-services

Question: 46 CertyIQ

HOTSPOT -
Which cloud deployment solution is used for Azure virtual machines and Azure SQL databases? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

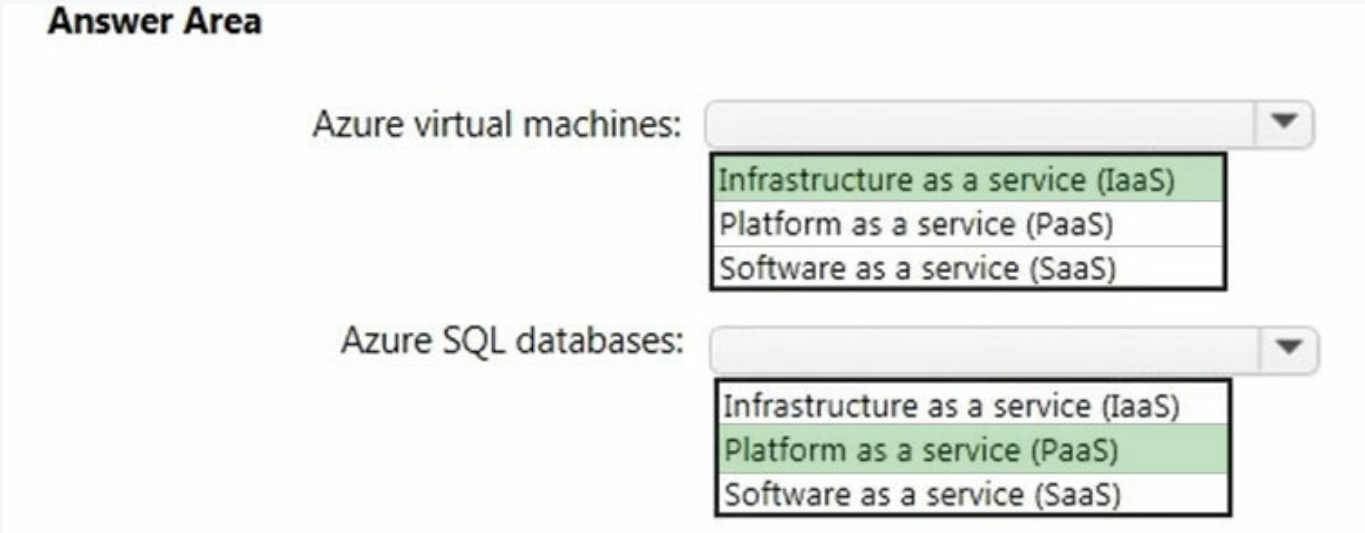


Azure Virtual Machines (IaaS): Provides raw computing infrastructure (virtualized CPU, memory, storage, and networking). The customer maintains complete administrative control over the guest operating system, runtime installation, security patching, and application stacks.

Azure SQL Database (PaaS): An intelligent, fully managed relational database engine hosted on cloud infrastructure. Microsoft manages OS patching, hardware provisioning, automated backups, and high availability, allowing the user to manage solely the database schemas, tables, and data without server-level administrative burdens.

Answer:

Answer Area



Explanation:
Box 1:
Azure virtual machines are Infrastructure as a Service (IaaS).
Infrastructure as a Service is the most flexible category of cloud services. It aims to give you complete control over the hardware that runs your application (IT infrastructure servers and virtual machines (VMs), storage,

networks, and operating systems). Instead of buying hardware, with IaaS, you rent it.
Box 2:
Azure SQL databases are Platform as a Service (Paas).
Azure SQL Database is a fully managed Platform as a Service (PaaS) Database Engine that handles most of the database management functions such as upgrading, patching, backups, and monitoring without user involvement. Azure SQL Database is always running on the latest stable version of SQL Server Database Engine and patched OS with 99.99% availability. PaaS capabilities that are built-in into Azure SQL database enable you to focus on the domain specific database administration and optimization activities that are critical for your business.

Reference:
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/5-types-of-cloud-services
https://docs.microsoft.com/en-us/azure/sql-database/sql-database-paas-index

Question: 47 CertyIQ

You have an on-premises network that contains 100 servers.
You need to recommend a solution that provides additional resources to your users. The solution must minimize capital and operational expenditure costs.
What should you include in the recommendation?

A. a complete migration to the public cloud
B. an additional data center
C. a private cloud
D. a hybrid cloud

Hybrid Cloud: Combines an existing on-premises infrastructure (private environment) with public cloud services.

The organization already has 100 operational servers representing existing capital investments. Rather than purchasing new physical servers/data centers (incurring heavy CapEx) or undertaking an expensive, immediate full-scale re-architecture and migration of all 100 existing servers (incurring massive immediate migration and migration OpEx costs), adopting a hybrid cloud allows the organization to keep existing workloads on-premises while bursting or expanding only the additional required capacity into the public cloud on a pay-as-you-go basis.

Answer: D

Explanation:

This minimizes new CapEx (zero new on-premises hardware purchases) and optimizes OpEx (paying only for the marginal additional cloud resources)

Correct answer is D - Hybrid cloud. Utilize current resources and dynamically scale in public cloud if and when needed.

A hybrid cloud is a combination of a private cloud and a public cloud.

Capital expenditure is the spending of money up-front for infrastructure such as new servers.

With a hybrid cloud, you can continue to use the on-premises servers while adding new servers in the public cloud (Azure for example). Adding new servers in

Azure minimizes the capital expenditure costs as you are not paying for new servers as you would if you deployed new server on-premises.

Incorrect Answers:

A: A complete migration of 100 servers to the public cloud would involve a lot of operational expenditure (the cost of migrating all the servers).

B: An additional data center would involve a lot of capital expenditure (the cost of the new infrastructure).

C: A private cloud is hosted on on-premises servers to this would involve a lot of capital expenditure (the cost of the new infrastructure to host the private cloud).

https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/4-cloud-deployment-models

Question: 48 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
To achieve a hybrid cloud model, a company must always migrate from a private cloud model.	○	○
A company can extend the capacity of its internal network by using the public cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
To achieve a hybrid cloud model, a company must always migrate from a private cloud model.	○	○
A company can extend the capacity of its internal network by using the public cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Explanation:
Box 1: No -
It is not true that a company must always migrate from a private cloud model to implement a hybrid cloud. You could start with a public cloud and then combine that with an on-premise infrastructure to implement a hybrid cloud.

Box 2: Yes -
A company can extend the capacity of its internal network by using the public cloud. This is very common. When you need more capacity, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Box 3: No -
It is not true that only guest users can access cloud resources. You can give anyone with an account in Azure Active Directory access to the cloud resources.
There are many authentication scenarios but a common one is to replicate your on-premises Active Directory accounts to Azure Active Directory and provide access to the Azure Active Directory accounts. Another commonly used authentication method is 'Federation' where authentication for access to cloud resources is passed to another authentication provider such as an on-premises Active Directory.
https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 49 CertyIQ

You plan to migrate several servers from an on-premises network to Azure.
What is an advantage of using a public cloud service for the servers over an on-premises network?

A. The public cloud is owned by the public, NOT a private corporation

B. The public cloud is a crowd-sourcing solution that provides corporations with the ability to enhance the cloud

C. All public cloud resources can be freely accessed by every member of the public

D. The public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud

Answer: D

Explanation:

The public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud. The hardware resources (servers, infrastructure etc.) are managed by the cloud provider. Multiple companies create resources such as virtual machines and virtual networks on the hardware resources.

Incorrect Answers:

A: The public cloud is not owned by the public. In the case of Microsoft Azure, the cloud is owned by Microsoft.

B: The public cloud is a not crowd-sourcing solution. In the case of Microsoft Azure, the cloud is owned by Microsoft.

C: It is not true that public cloud resources can be freely accessed by every member of the public. You pay for a cloud subscription and create accounts for your users to access your cloud resources. No one can access your cloud resources until you create user accounts and provide the appropriate access permissions.

Question: 50 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Azure Site Recovery provides [▼] for virtual machines.

- fault tolerance
- disaster recovery
- elasticity
- high availability

Answer: Azure Site Recovery (ASR): Microsoft's native Disaster Recovery as a Service (DRaaS). It orchestrates replication, failover, and failback of physical servers and virtual machines across regions (Azure-to-Azure) or from on-premises environments (VMware/Hyper-V) to Azure.

When an outage or regional catastrophe occurs, ASR brings workloads back online in a secondary location according to predefined Recovery Time Objectives (RTO) and Recovery Point Objectives (RPO), making it a dedicated disaster recovery service.

Answer Area

Azure Site Recovery provides [▼] for virtual machines.

- fault tolerance
- disaster recovery
- elasticity
- high availability

Explanation:

The answer is Disaster Recovery.

Azure Site Recovery is a disaster recovery service provided by Microsoft Azure, which can be used to protect and recover virtual machines. You can find more information on this service on the Azure website:

https://azure.microsoft.com/en-us/services/site-recovery/ .

Question: 51 CertyIQ

In which type of cloud model are all the hardware resources owned by a third-party and shared between multiple tenants?

A. private
B. hybrid
C. public

Answer: C

Explanation:

Private cloud-taken care by the internal organization to which it belongs

Public cloud-entirely taken care by 3rd party such as Azure, AWS, GCP

Hybrid cloud-combination of on-premises (private)as well as public(3rd party)

Question: 52 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [ ] cloud.

- hybrid
- multi-vendor
- private
- public

Answer:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [hybrid] cloud.

- hybrid
- multi-vendor
- private
- public

Explanation:

hybrid cloud — sometimes called a cloud hybrid — is a computing environment that combines an on-premises datacentre (also called a private cloud) with a public cloud, allowing data and applications to be shared between them. Some people define hybrid cloud to include "multi-cloud" configurations where an organisation uses more than one public cloud in addition to their on-premises datacentre

Reference:

https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 53 CertyIQ

You have 1,000 virtual machines hosted on the Hyper-V hosts in a data center.
You plan to migrate all the virtual machines to an Azure pay-as-you-go subscription.
You need to identify which expenditure model to use for the planned Azure solution.
Which expenditure model should you identify?

A. operational
B. elastic

C. capital

D. scalable

Answer: A

Explanation:

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it). This switch also requires more careful management of your costs. The benefit of the cloud is that you can fundamentally and positively affect the cost of a service you use by merely shutting down or resizing it when it's not needed.

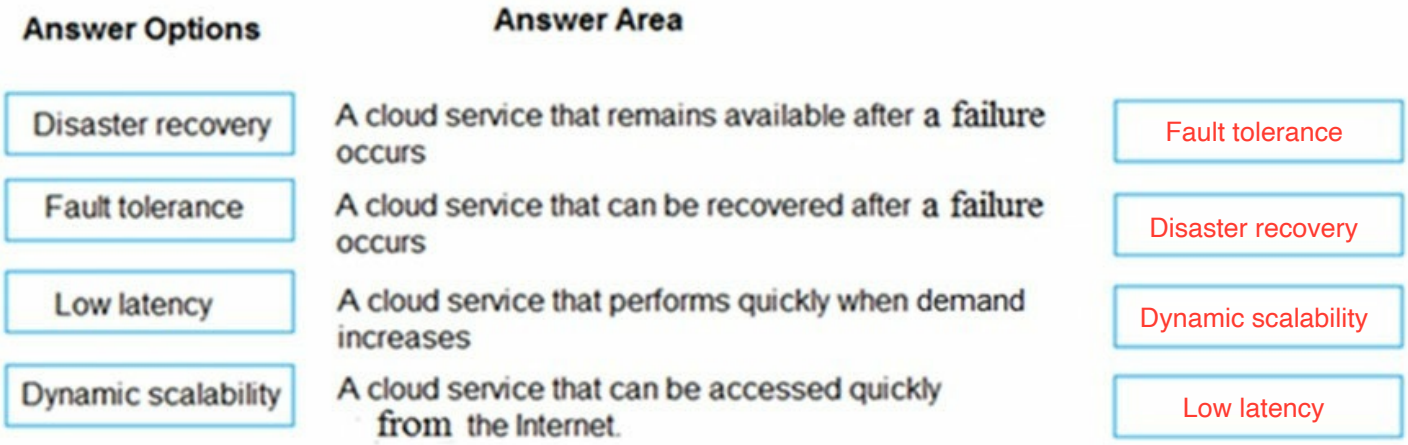
The expenditure models are either CapEx or OpEx (Capital or Operational). CapEx is what you pay upfront, on prem, for servers, racks, cooling, security, the Datacenter itself. OpEx is what you pay to keep your infrastructure operational, like IT staff. In this case, when you move to the Cloud, what you identify in this case is the OpEx or Operational model. This is because you actually don't have CapEx on the Cloud (or at least you look to minimize CapEx) as you pay for the resources you use and not for the underlying hardware, security, cooling, etc that you will pay for in an On-Prem solution. That is why the right answer is (A) Operational. Elastic and Scalable are not expenditure models.

Reference:

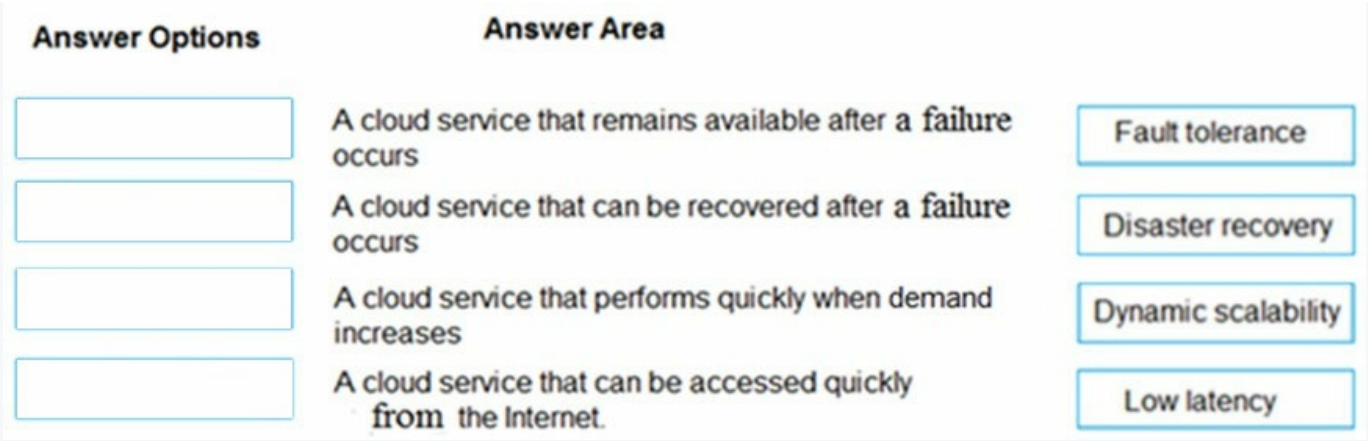
https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold

Question: 54 CertyIQ

DRAG DROP -
Match the Azure services benefits to the correct descriptions.
Instructions: To answer, drag the appropriate benefit from the column on the left to its description on the right.
Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Box 1:

Fault tolerance is the ability of a service to remain available after a failure of one of the components of the service. For example, a service running on multiple servers can withstand the failure of one of the servers.

Box 2:

Disaster recovery is the recovery of a service after a failure. For example, restoring a virtual machine from backup after a virtual machine failure.

Box 3:

Dynamic scalability is the ability for compute resources to be added to a service when the service is under heavy load. For example, in a virtual machine scale set, additional instances of the virtual machine are added when the existing virtual machines are under heavy load.

Box 4:

Latency is the time a service to respond to requests. For example, the time it takes for a web page to be returned from a web server. Low latency means low response time which means a quicker response.

Question: 55

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
To implement a hybrid cloud model, a company must have an internal network.	○	○
A company can extend the computing resources of its internal network by using a hybrid cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
To implement a hybrid cloud model, a company must have an internal network.	○	○
A company can extend the computing resources of its internal network by using a hybrid cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Explanation:

Box 1: Yes

Box 2: Yes -

A company can extend the computing resources of its internal network by using the public cloud. This is very common. When you need more resources, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Box 3: No -

It is not true that only guest users can access cloud resources. You can give anyone with an account in Azure Active Directory access to the cloud resources.

There are many authentication scenarios but a common one is to replicate your on-premises Active Directory accounts to Azure Active Directory and provide access to the Azure Active Directory accounts. Another commonly used authentication method is 'Federation' where authentication for access to cloud resources is passed to another authentication provider such as an on-premises Active Directory.

Question: 56 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A Platform as a Service (PaaS) solution provides full control of operating systems that host applications.	○	○
A Platform as a Service (PaaS) solution provides additional memory to apps by changing pricing tiers.	○	○
A Platform as a Service (PaaS) solution can automatically scale the number of instances.	○	○

Answer:

Answer Area

Statements	Yes	No
A Platform as a Service (PaaS) solution provides full control of operating systems that host applications.	○	○
A Platform as a Service (PaaS) solution provides additional memory to apps by changing pricing tiers.	○	○
A Platform as a Service (PaaS) solution can automatically scale the number of instances.	○	○

Explanation:

No

Yes

Yes

(PaaS) solution DOES NOT provide full control of operating systems that host applications.

(PaaS) solution provides additional memory to apps by changing pricing tiers.

(PaaS) solution can automatically scale the number of intances.

Question: 57 CertyIQ

Your company has an on-premises network that contains multiple servers.
The company plans to reduce the following administrative responsibilities:
- Backing up application data
- Replacing failed server hardware
- Managing physical server security
- Updating server operating systems
- Managing permissions to shared documents

The company plans to migrate servers to Azure virtual machines.
You need to identify which administrative responsibilities will be eliminated after the planned migration.
Which two responsibilities should you identify? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Replacing failed server hardware
B. Backing up application data
C. Managing physical server security
D. Updating server operating systems
E. Managing permissions to shared documents

Answer: AC

Explanation:
Azure virtual machines run on Hyper-V physical servers. The physical servers are owned and managed by Microsoft. As an Azure customer, you have no access to the physical servers. Microsoft manage the replacement of failed server hardware and the security of the physical servers so you don't need to.
Incorrect Answers:
B: Microsoft have no control over the applications you run on the virtual machines. Therefore, it is your responsibility to ensure that application data is backed up.
D: Microsoft do not manage the operating systems you run on the virtual machines. Therefore, it is your responsibility to ensure that the operating systems are updated.
E: Microsoft have no control over the shared folders you host on the virtual machines. Therefore, it is your responsibility to ensure that folder permissions are configured appropriately.

Question: 58 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Pay-As-You-Go pricing is an example of CapEx.	○	○
Paying electricity for your datacenter is an example of OpEx.	○	○
Deploying your own datacenter is an example of CapEx.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Pay-As-You-Go pricing is an example of CapEx.	○	○
Paying electricity for your datacenter is an example of OpEx.	○	○
Deploying your own datacenter is an example of CapEx.	○	○

Explanation:

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it).

Box 1: No -

With the pay-as-go model, you pay for services as you use them. This is Opex (Operational Expenditure), not CapEx (Captial Expenditure). CapEx is where you pay for something upfront. For example, buying a new physical server.

Box 2: No -

Paying for electricity for your own datacenter will be classed as CapEx, not OpEx.

Box 3: Yes -

Deploying your own datacenter is an example of CapEx. This is because you need to purchase all the infrastructure upfront before you can use it.

Reference:

https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold

Question: 59 CertyIQ

You plan to provision Infrastructure as a Service (IaaS) resources in Azure.
Which resource is an example of IaaS?

A. an Azure web app
B. an Azure virtual machine
C. an Azure logic app
D. an Azure SQL database

Answer:

B

Explanation:

An Azure virtual machine is an example of Infrastructure as a Service (IaaS).

Azure web app, Azure logic app and Azure SQL database are all examples of Platform as a Service (Paas).

Reference:

https://azure.microsoft.com/en-gb/overview/what-is-iaas/

https://azure.microsoft.com/en-gb/overview/what-is-paas/

Question: 60 CertyIQ

To which cloud models can you deploy physical servers?

A. private cloud and hybrid cloud only

B. private cloud only

C. private cloud, hybrid cloud and public cloud

D. hybrid cloud only

In a public cloud, all physical hardware and servers are owned, deployed, and managed exclusively by the cloud provider (Microsoft). The customer has no ability or authorization to physically provision, install, or rack bare-metal physical servers.

In a private cloud, an organization owns or controls the dedicated physical infrastructure, meaning the organization itself purchases, racks, and deploys physical host servers into the environment.

Answer: A

Explanation:

In a hybrid cloud, the architecture combines public cloud services with an organization's on-premises/private infrastructure. Because the organization manages and maintains the on-premises private footprint of the hybrid architecture, it can deploy physical servers to that portion of the environment

A private cloud is on-premises so you can deploy physical servers.

A hybrid cloud is a mix of on-premise and public cloud resources. You can deploy physical servers on-premises.

Reference:

https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 61 CertyIQ

DRAG DROP -
Match the cloud model to the correct advantage.
Instructions: To answer, drag the appropriate cloud model from the column on the left to its advantage on the right. Each cloud model may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point
Select and Place:

Public Cloud (No required capital expenditure): In a pure public cloud model, organizations do not purchase physical hardware, servers, or datacenter infrastructure. Instead, all compute and storage are rented on a consumption basis (Operational Expenditure / OpEx), completely eliminating mandatory CapEx.

Private Cloud (Provides complete control over security): Because hardware, networking, physical facilities, and hypervisors are dedicated entirely to a single organization, the company retains absolute control over physical security, network perimeter configuration, regulatory compliance, and system hardening.

Cloud model	Work Area	
Hybrid Cloud	Public Cloud	No required capital expenditure.
Private Cloud	Private Cloud	Provides complete control over security.
Public Cloud	Hybrid Cloud	Provides a choice to use on-premises or cloud-based resources.

Hybrid Cloud (Provides a choice to use on-premises or cloud-based resources): A hybrid environment integrates on-premises private infrastructure with public cloud services, offering the flexibility to choose where specific workloads or datasets reside (e.g., highly sensitive legacy databases stay on-premises, while elastic web apps run in the public cloud).

Answer:

Cloud model	Work Area	
Hybrid Cloud	Public Cloud	No required capital expenditure.
Private Cloud	Private Cloud	Provides complete control over security.
Public Cloud	Hybrid Cloud	Provides a choice to use on-premises or cloud-based resources.

Explanation:

Box 1: Public Cloud -

With a public cloud, there is no capital expenditure on server hardware etc. You only pay for cloud resources that you use as you use them.

Box 2: Private Cloud -

A private cloud exists on premises, so you have complete control over security.

Box 3: Hybrid Cloud -

A hybrid cloud is a mix of public cloud resources and on-premises resources. Therefore, you have a choice to use either.

Question: 62

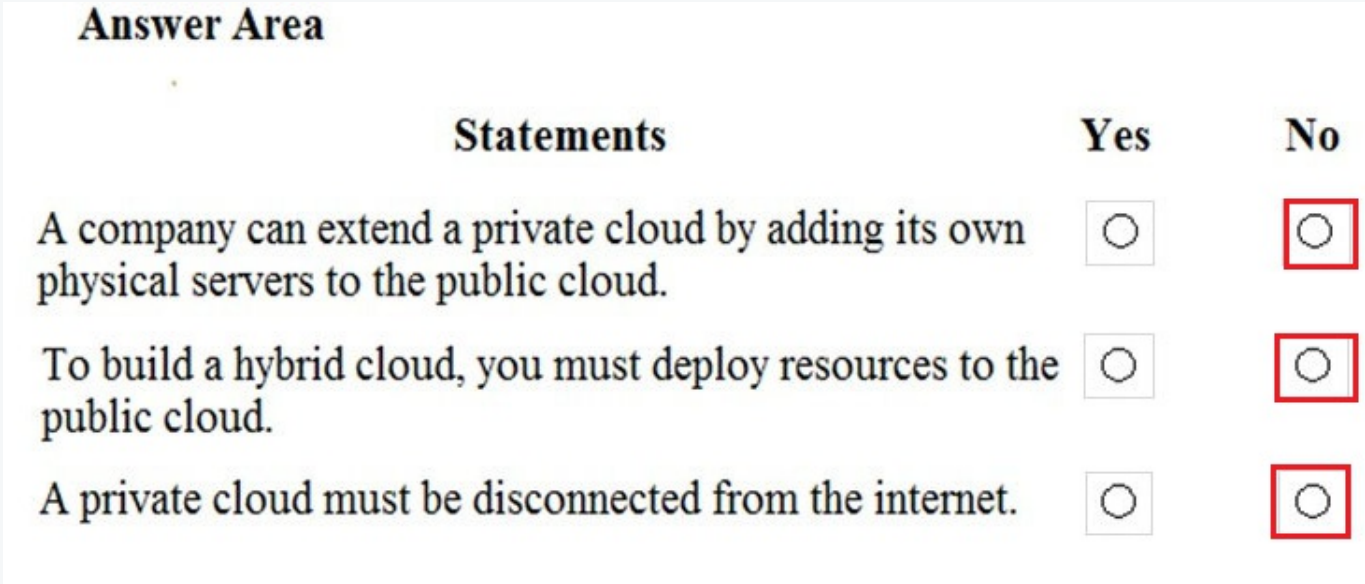
CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A company can extend a private cloud by adding its own physical servers to the public cloud.	○	○
To build a hybrid cloud, you must deploy resources to the public cloud.	○	○
A private cloud must be disconnected from the internet.	○	○

Answer:



Explanation:

Box 1: No .

You cannot add physical servers to the public cloud. You can only deploy virtual servers in the public cloud. You can extend a private cloud by deploying virtual servers in a public cloud. This would create a hybrid cloud.

Box 2: No.

Box 3: No.

It is not true that a private cloud must be disconnected from the Internet. Private clouds can be and most commonly are connected to the Internet. Private cloud means that the physical servers are managed by you. It does not mean that it is disconnected from the Internet.

Question: 63 CertyIQ

You have 50 virtual machines hosted on-premises and 50 virtual machines hosted in Azure. The on-premises virtual machines and the Azure virtual machines connect to each other.
Which type of cloud model is this?

A. hybrid
B. private
C. public

Answer: A

Explanation:

The correct answer is A. hybrid.

A hybrid cloud model combines an organization's internal infrastructure (a private cloud or on-premises data center) with a public cloud provider's infrastructure (such as Microsoft Azure, AWS, or Google Cloud), allowing data and applications to be shared and communicate between them.

References:

https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 64 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	○
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be provided with additional memory by changing the pricing tier.	○	○
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be configured to automatically scale the number of instances based on demand.	○	○

Answer:

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	●
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be provided with additional memory by changing the pricing tier.	●	○
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be configured to automatically scale the number of instances based on demand.	●	○

Explanation:
Box 1: No -
A PaaS solution does not provide access to the operating system. The Azure Web Apps service provides an environment for you to host your web applications.
Behind the scenes, the web apps are hosted on virtual machines running IIS. However, you have no direct access to the virtual machine, the operating system or
IIS.

Box 2: Yes -

Box 3: Yes -
A PaaS solution that hosts web apps in Azure does provide the ability to scale the platform automatically. This is known as autoscaling. Behind the scenes, the web apps are hosted on virtual machines running IIS. Autoscaling means adding more load balanced virtual machines to host the web apps.

Reference:
https://azure.microsoft.com/en-gb/overview/what-is-paas/

Question: 65 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not

appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create Azure virtual machines, Azure SQL databases, and Azure Storage accounts.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

Platform as a service (PaaS) is a complete development and deployment environment in the cloud. PaaS includes infrastructure " servers, storage, and networking " but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the complete web application lifecycle: building, testing, deploying, managing, and updating.

However, virtual machines are examples of Infrastructure as a service (IaaS). IaaS is an instant computing infrastructure, provisioned and managed over the internet.

References:

https://azure.microsoft.com/en-us/overview/what-is-paas/

https://azure.microsoft.com/en-us/overview/what-is-iaas/

Question: 66 CertyIQ

Your company plans to deploy several custom applications to Azure. The applications will provide invoicing services to the customers of the company. Each application will have several prerequisite applications and services installed.
You need to recommend a cloud deployment solution for all the applications.
What should you recommend?

A. Software as a Service (SaaS)
B. Platform as a Service (PaaS)
C. Infrastructure as a Service (IaaS)

Answer: C

Explanation:
Infrastructure as a service (IaaS) is an instant computing infrastructure, provisioned and managed over the internet. The IaaS service provider manages the infrastructure, while you purchase, install, configure, and manage your own software
Incorrect Answers:
A: Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring, and office tools. In this scenario, you need to run your own apps, and therefore require an infrastructure.
B:
Platform as a service (PaaS) is a complete development and deployment environment in the cloud. PaaS includes infrastructure"servers, storage, and networking"but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the

complete web application lifecycle: building, testing, deploying, managing, and updating.

Question: 67 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Building a data center infrastructure is an example of operational expenditure (OpEx) costs.	○	○
Monthly salaries for technical personnel are an example of operational expenditure (OpEx) costs.	○	○
Leasing software is an example of operational expenditure (OpEx) costs.	○	○

Answer:

Answer Area

Statements	Yes	No
Building a data center infrastructure is an example of operational expenditure (OpEx) costs.	○	○
Monthly salaries for technical personnel are an example of operational expenditure (OpEx) costs.	○	○
Leasing software is an example of operational expenditure (OpEx) costs.	○	○

Explanation:

Box 1: No -
Building a data center infrastructure is capital expenditure, not operation expenditure.

Box 2: Yes -
OpEx is ongoing costs (costs of operations) such as staff salaries.

Box 2: Yes -
OpEx is ongoing costs (costs of operations) such as leasing software. If you purchased software as a one-off purchase, that would be CapEx, but leasing software is ongoing so it's OpEx.

Question: 68 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.

Statements	Yes	No
With software as a service (SaaS), you must apply software updates.	○	○
With infrastructure as a service (IaaS), you must install the software that you want to use.	○	○
Azure Backup is an example of platform as a service (PaaS).	○	○

Answer:

Answer Area

Statements	Yes	No
With software as a service (SaaS), you must apply software updates.	○	○
With infrastructure as a service (IaaS), you must install the software that you want to use.	○	○
Azure Backup is an example of platform as a service (PaaS).	○	○

Explanation:

Statement 1: With software as a service (SaaS), you must apply software updates.

Answer: No

Explanation: In a SaaS model (like Microsoft 365, Salesforce, or Gmail), the cloud provider manages the entire application stack. This includes hardware, virtualization, operating systems, and the application software itself. The vendor automatically handles all software updates, feature upgrades, and bug patches behind the scenes without any effort or intervention from the end user.

Statement 2: With infrastructure as a service (IaaS), you must install the software that you want to use.

Answer: Yes

Explanation: IaaS provides the rawest form of cloud computing resources — typically virtual machines, storage, and networking. While the cloud provider manages the physical data center hardware and hypervisor, you are given full administrative control over the operating system. This means you are completely responsible for installing, configuring, and maintaining any software, runtimes, middleware, or applications you intend to run.

Statement 3: Azure Backup is an example of platform as a service (PaaS).

Answer: Yes

Explanation: PaaS provides a managed environment where you can deploy applications or consume services

without the complexity of managing the underlying operating systems, VMs, or hardware infrastructure. Azure Backup is a fully managed, serverless backup-as-a-service solution. You do not need to provision storage servers, install backup software, or patch an OS to use it; you simply configure your backup policies and let Azure handle the underlying execution, which classifies it perfectly under the PaaS umbrella.

https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 70

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can create a resource group inside of another resource group.	○	○
An Azure virtual machine can be in multiple resource groups.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Answer:

Answer Area

Statements	Yes	No
You can create a resource group inside of another resource group.	○	○
An Azure virtual machine can be in multiple resource groups.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Explanation:

Box 1: No -

Box 2: No -

Each resource can exist in only one resource group.

Box 3: Yes -

Resources from multiple different regions can be placed in a resource group. The resource group only contains metadata about the resources it contains.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview
https://www.codeisahighway.com/effective-ways-to-delete-resources-in-a-resource-group-on-azure/

Question: 71 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Answer Area

Statements	Yes	No
Microsoft SQL Server 2019 installed on an Azure virtual machine is an example of platform as a service (PaaS).	○	○
Azure SQL Database is an example of platform as a service (PaaS).	○	○
Azure Cosmos DB is an example of software as a service (SaaS).	○	○

Answer:

Answer Area

Statements	Yes	No
Microsoft SQL Server 2019 installed on an Azure virtual machine is an example of platform as a service (PaaS).	○	○
Azure SQL Database is an example of platform as a service (PaaS).	○	○
Azure Cosmos DB is an example of software as a service (SaaS).	○	○

Explanation:

Statement 1: Microsoft SQL Server 2019 installed on an Azure virtual machine is an example of platform as a service (PaaS).

Answer: No

Explanation: When you deploy an Azure Virtual Machine and install SQL Server on it, you are leveraging Infrastructure as a Service (IaaS). You are responsible for managing the underlying operating system, configuring the SQL Server installation, managing storage disks, and applying both OS patches and database cumulative updates.

Statement 2: Azure SQL Database is an example of platform as a service (PaaS).

Answer: Yes

Explanation: Azure SQL Database is a fully managed relational database engine. Azure handles all core infrastructure management, including hardware provisioning, operating system patching, database software updates, backups, and high availability configurations. You only manage your schemas, data, and access permissions, which fits the definition of PaaS.

Statement 3: Azure Cosmos DB is an example of software as a service (SaaS).

Answer: No

Explanation: Azure Cosmos DB is a fully managed NoSQL and relational database service designed for

modern app development, which classifies it as a Platform as a Service (PaaS). It is a building block for developers to build applications upon. SaaS, by contrast, refers to end-user applications delivered over the web (such as Microsoft 365, Salesforce, or Microsoft Dynamics 365) where the end-user interacts with a complete software interface rather than a database engine.

Reference:

https://docs.microsoft.com/en-us/azure/azure-sql/azure-sql-iaas-vs-paas-what-is-overview https://docs.microsoft.com/en-us/azure/cosmos-db/account-databases-containers-items https://www.red-gate.com/simple-talk/cloud/azure/overview-of-azure-cosmos-db

Question: 72 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:
Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [ ]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Answer:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [ ]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Explanation:

Managed by Azure is the key, so, is a PaaS

Reference:

https://docs.microsoft.com/en-us/azure/azure-sql/azure-sql-iaas-vs-paas-what-is-overview

Question: 73 CertyIQ

Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company's migration plan.
What should you create?

A. Azure virtual machines, Azure SQL databases, and Azure Storage accounts.
B. an Azure App Service and Azure virtual machines that have Microsoft SQL Server installed.
C. an Azure App Service and Azure SQL databases.
D. Azure storage accounts and web server in Azure virtual machines.

Answer: C

Explanation:
Azure App Service and Azure SQL databases are examples of Azure PaaS solutions. Therefore, this solution does meet the goal.

Question: 74 CertyIQ

What does a customer provide in a software as a service (SaaS) model?

A. application data
B. data storage
C. compute resources
D. application software

Answer: A

Explanation:
SaaS provides a complete software solution which you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure, middleware, app software and app data are located in the service provider's data center. The service provider manages the hardware and software and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well.

Reference:
https://azure.microsoft.com/en-in/overview/what-is-saas/

Question: 75 CertyIQ

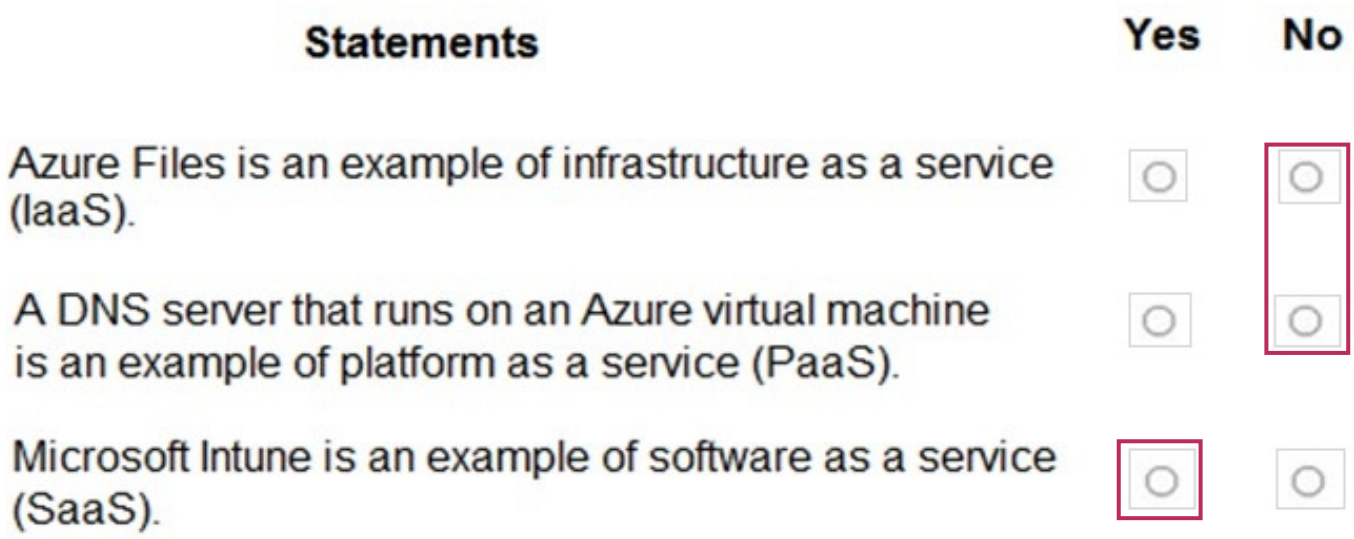
HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (Azure Files = PaaS): Azure Files provides fully managed serverless file shares in the cloud accessible via SMB or NFS protocols. Because Microsoft manages all hardware, server infrastructure, OS, and maintenance without requiring you to manage underlying virtual machines, it falls under Platform as a Service (PaaS).

Statement 2 (DNS on a VM = IaaS): Installing and running services or server roles (such as a DNS server) directly inside an Azure Virtual Machine places the operating system, server software, patching, and configuration under the customer's control, which defines Infrastructure as a Service (IaaS). (Note: Azure DNS, the managed DNS hosting service, is PaaS, but running DNS software on a VM is IaaS).

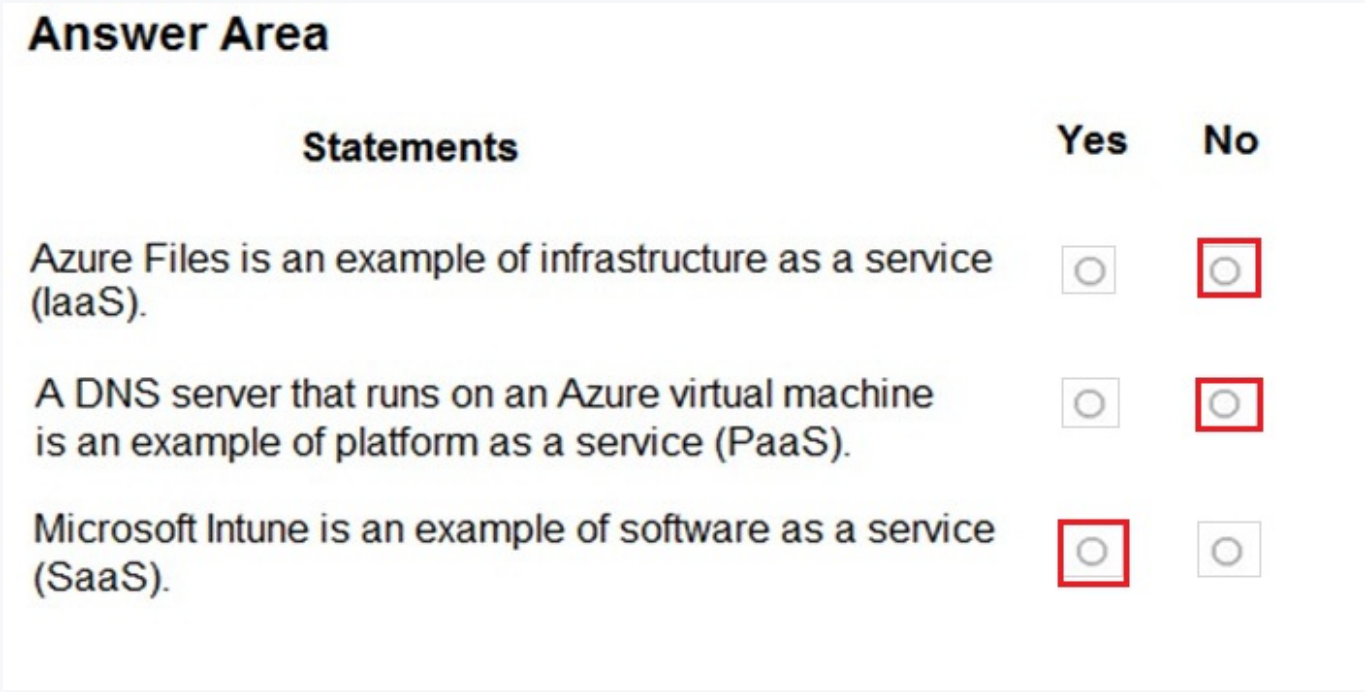
Statement 3 (Microsoft Intune = SaaS): Microsoft Intune is a cloud-based unified endpoint management (UEM) solution that is consumed directly via the web/admin center without the customer managing any servers, runtimes, or underlying application layers, categorizing it as Software as a Service (SaaS).

Answer Area



Answer:

Answer Area



Explanation:

1.) Azure Files is an example of infrastructure as a service (IaaS).

Answer: **No.** Azure Files is actually a managed file storage service, which is considered a part of Platform as a Service (PaaS).

2.) A DNS server that runs on an Azure virtual machine is an example of platform as a service (PaaS).

Answer: **No.** A DNS server running on an Azure virtual machine would be considered Infrastructure as a Service (IaaS) because it involves managing the underlying infrastructure.

3.) Microsoft Intune is an example of software as a service (SaaS).

Answer: **Yes.** Microsoft Intune is indeed a Software as a Service (SaaS) as it provides software over the internet without needing local installation.

Question: 76 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Cloud computing provides elastic scalability.	○	○
Customers can minimize capital expenditure (CapEx) by using a public cloud.	○	○
Cloud computing leverages virtualization to provide services to multiple customers simultaneously.	○	○

Answer:

Answer Area

Statements	Yes	No
Cloud computing provides elastic scalability.	○	○
Customers can minimize capital expenditure (CapEx) by using a public cloud.	○	○
Cloud computing leverages virtualization to provide services to multiple customers simultaneously.	○	○

Explanation:

Cloud computing provides elastic scalability: Yes. "Elasticity" means the system can automatically add or remove resources (like server power or storage) instantly to match your current needs.Customers can minimize capital expenditure (CapEx) by using a public cloud: Yes. Instead of buying expensive hardware upfront (CapEx), you pay for what you use as an ongoing operating expense (OpEx).Cloud computing leverages virtualization to provide services to multiple customers simultaneously: Yes. Virtualization allows a single physical server to be divided into multiple "virtual" environments, enabling providers to serve many customers at once using the same hardware.

Question: 77 CertyIQ

What is the first stage in the Microsoft Cloud Adoption Framework for Azure?

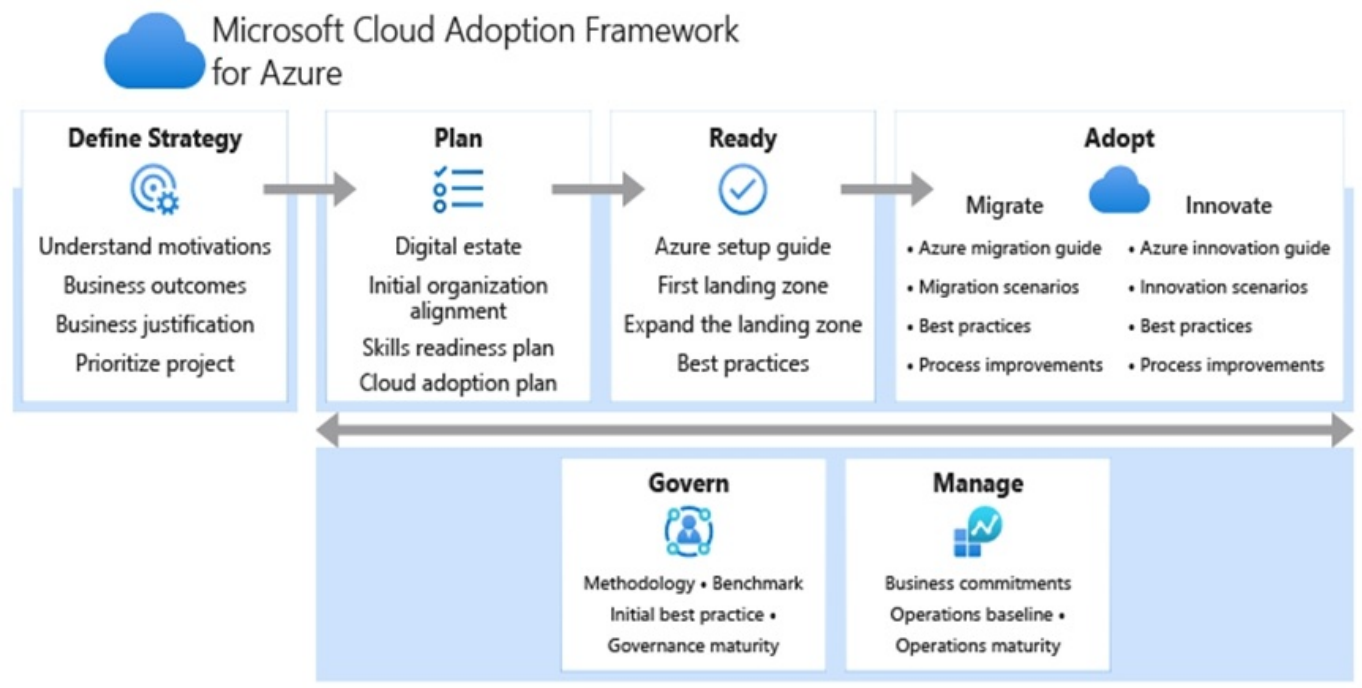
A. Adopt the cloud.
B. Make a plan.

C. Ready your organization.

D. Define your strategy.

Answer: D

Explanation:



Reference:
https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/overview

Question: 78

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A company can extend an internal network by adding its own physical servers to the public cloud.	○	○
A private cloud must be disconnected from the internet.	○	○
Part of a hybrid cloud is the public cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
A company can extend an internal network by adding its own physical servers to the public cloud.	○	●
A private cloud must be disconnected from the internet.	○	●
Part of a hybrid cloud is the public cloud.	●	○

Explanation:
Box 1: No -
You cannot add physical servers to the public cloud. You can only deploy virtual servers in the public cloud.
You can extend a private cloud by deploying virtual servers in a public cloud. This would create a hybrid cloud.

Box 2: No -
A private cloud exists in cyberspace and is accessed via the internet.
Box 3: Yes.

Reference:
https://azure.microsoft.com/en-gb/overview/what-are-private-public-hybrid-clouds/

Question: 79 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You must have physical servers to use cloud computing.	○	●
You must have internet connectivity to use cloud computing.	●	○
The costs to increase cloud computing capacity are less than the costs to increase the computing capacity of an on-premises datacenter.	●	○

Answer:

Answer Area

Statements	Yes	No
You must have physical servers to use cloud computing.	○	○
You must have internet connectivity to use cloud computing.	○	○
The costs to increase cloud computing capacity are less than the costs to increase the computing capacity of an on-premises datacenter.	○	○

Explanation:
Box 1: No -
Virtual Machines works.

Box 2: Yes -
Simply put, cloud computing is the delivery of computing services"including servers, storage, databases, networking, software, analytics, and intelligence"over the Internet (the cloud) to offer faster innovation, flexible resources, and economies of scale.

Box 3: Yes -

Reference:
https://azure.microsoft.com/en-us/overview/what-is-cloud-computing/

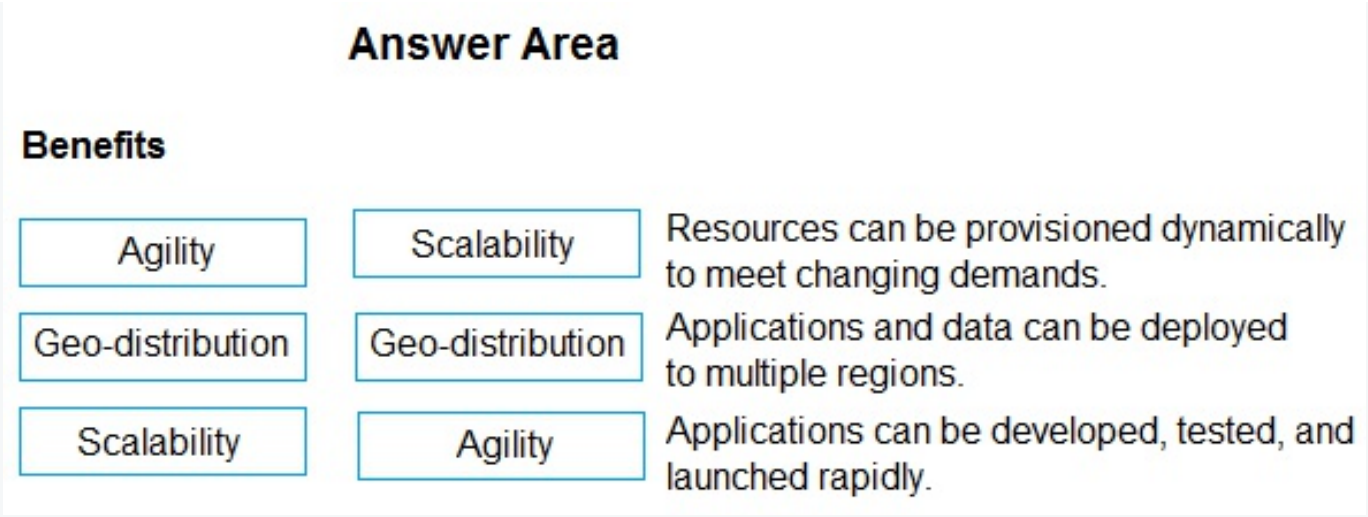
Question: 80 CertyIQ

DRAG DROP -
Match the cloud computing benefits to the correct descriptions.
To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer Area

Benefits		
Agility	Scalability	Resources can be provisioned dynamically to meet changing demands.
Geo-distribution	Geo Distribution	Applications and data can be deployed to multiple regions.
Scalability	Agility	Applications can be developed, tested, and launched rapidly.

Answer:



Explanation:

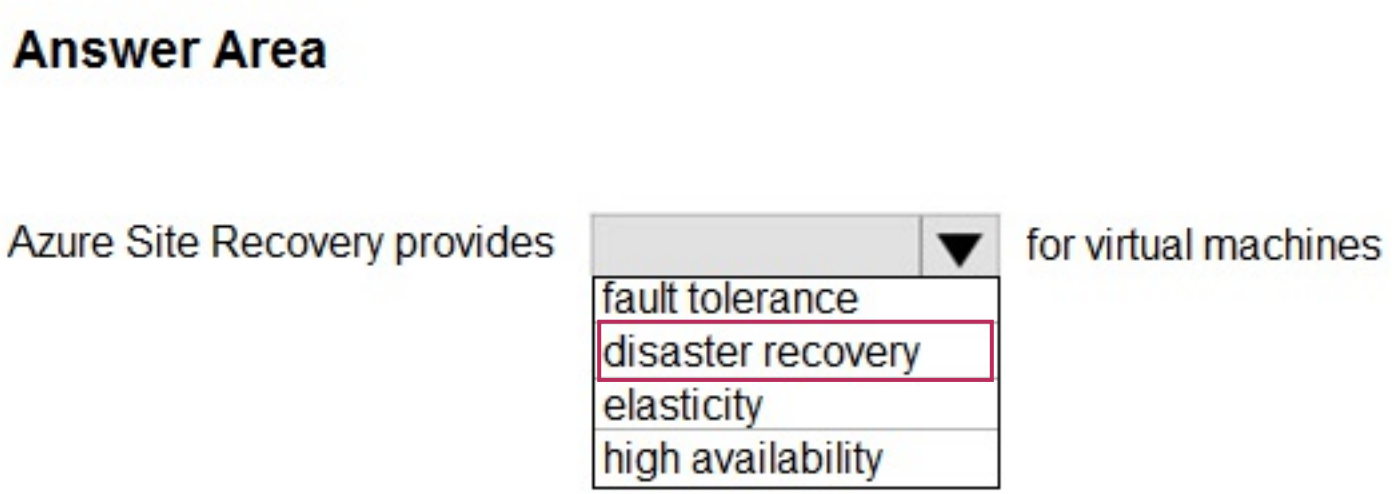
1. Scalability $\rightarrow$ Resources can be provisioned dynamically to meet changing demands. Scalability refers to a system's capacity to handle growing or shrinking workloads by adjusting its resource footprint.Key Context: This can happen horizontally (adding or removing instances, like adding more virtual machines to a cluster) or vertically (upgrading or downgrading an existing instance's power, like increasing memory or CPU). It ensures that your underlying infrastructure matches your operational demands perfectly.

2. Geo-distribution $\rightarrow$ Applications and data can be deployed to multiple regions. Geo-distribution is the practice of running application instances and replicating data stores across distinct physical data center locations globally.Key Context: This provides two major advantages: it ensures regional redundancy (if an entire geographic area suffers an extreme weather event or infrastructure outage, traffic routes to another region), and it drastically reduces network latency for global end-users by serving content from a data center physically closest to them.

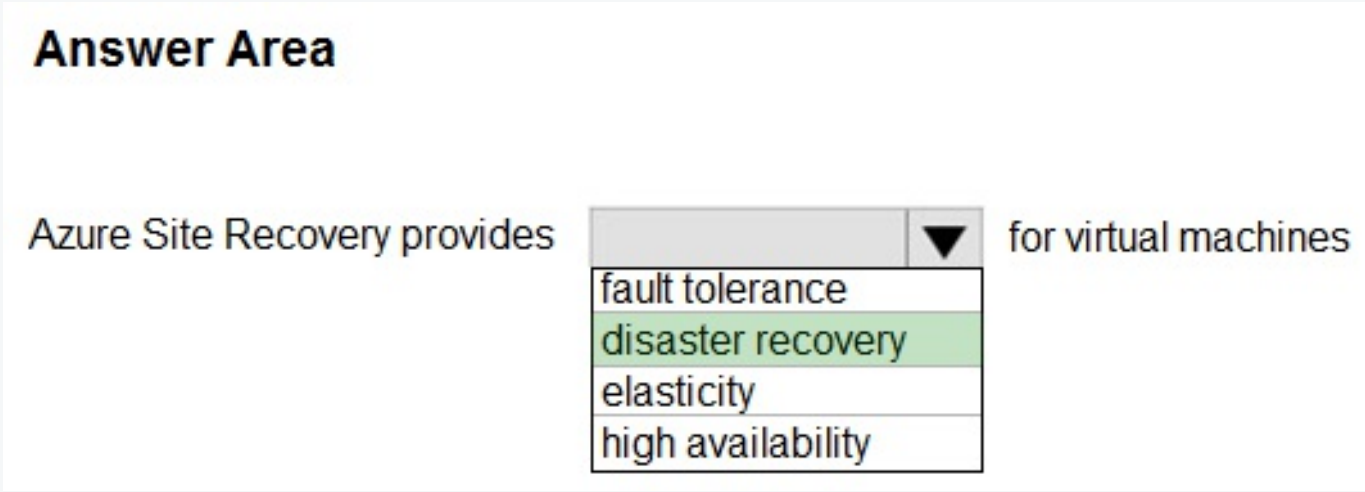
3. Agility $\rightarrow$ Applications can be developed, tested, and launched rapidly. Agility describes the operational speed, organizational flexibility, and reduced time-to-market achieved by shifting workloads to a cloud environment.Key Context: Because developers do not have to wait for procurement teams to order, ship, and rack physical server hardware, they can provision entire dev/test infrastructure environments via code or portal menus in minutes. This drastically accelerates software deployment lifecycles and allows companies to iterate quickly on new features.

Question: 81 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:

You set up disaster recovery for Azure VMs using Azure Site Recovery.

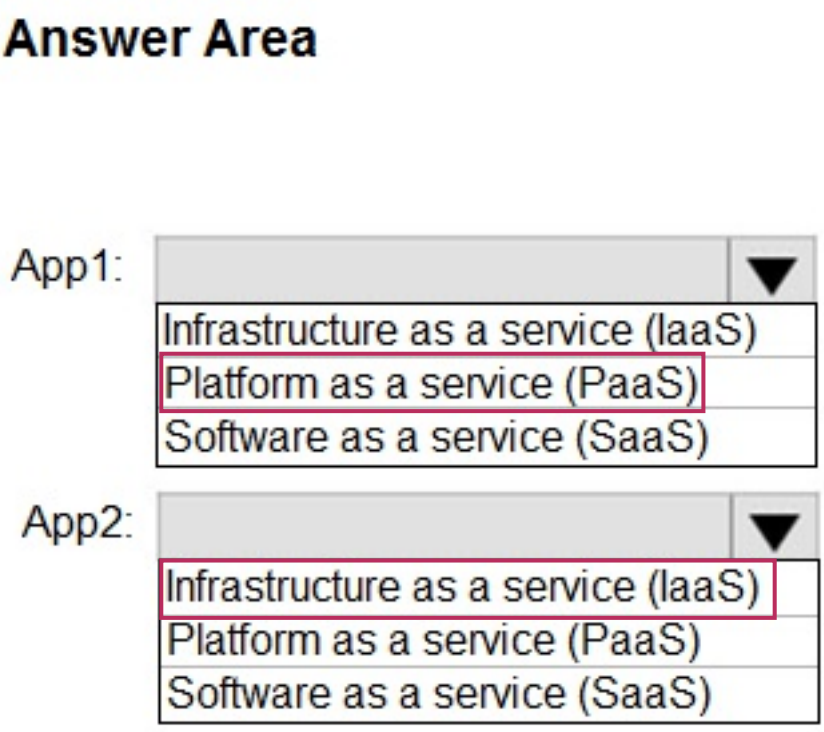
Reference:

https://docs.microsoft.com/en-us/azure/site-recovery/azure-to-azure-tutorial-enable-replication

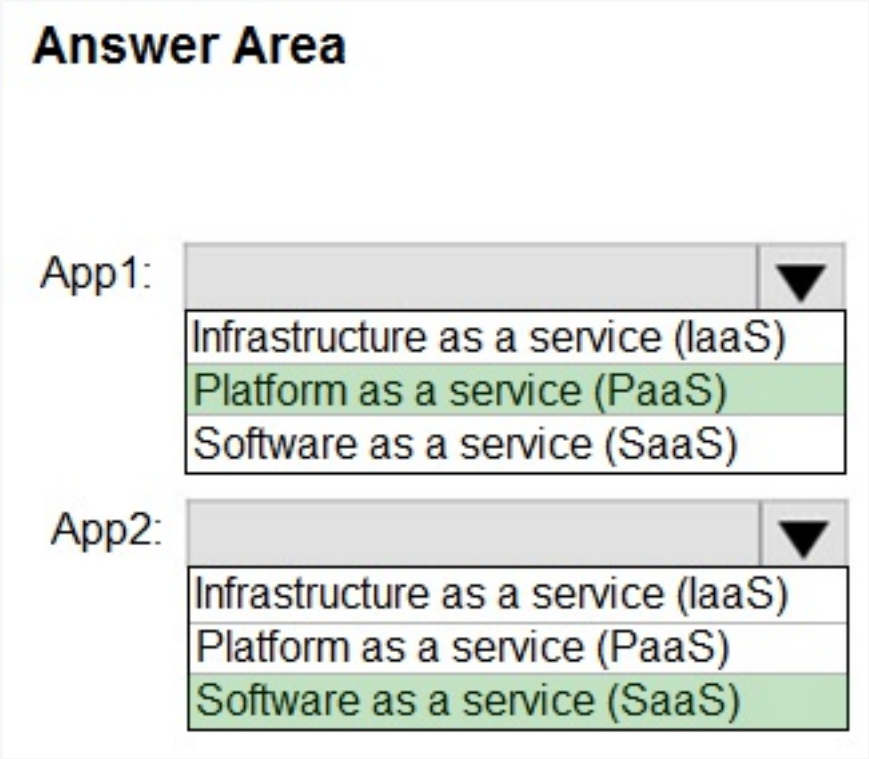
Question: 82 CertyIQ

HOTSPOT -
You plan to use Azure to host two apps named App1 and App2. The apps must meet the following requirements:
- You must be able to modify the code of App1.
- Administrative effort to manage the operating system of App1 must be minimized.
- App2 must run interactively with the operating system of the server.

Which type of cloud service should you use for each app? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:



Answer:

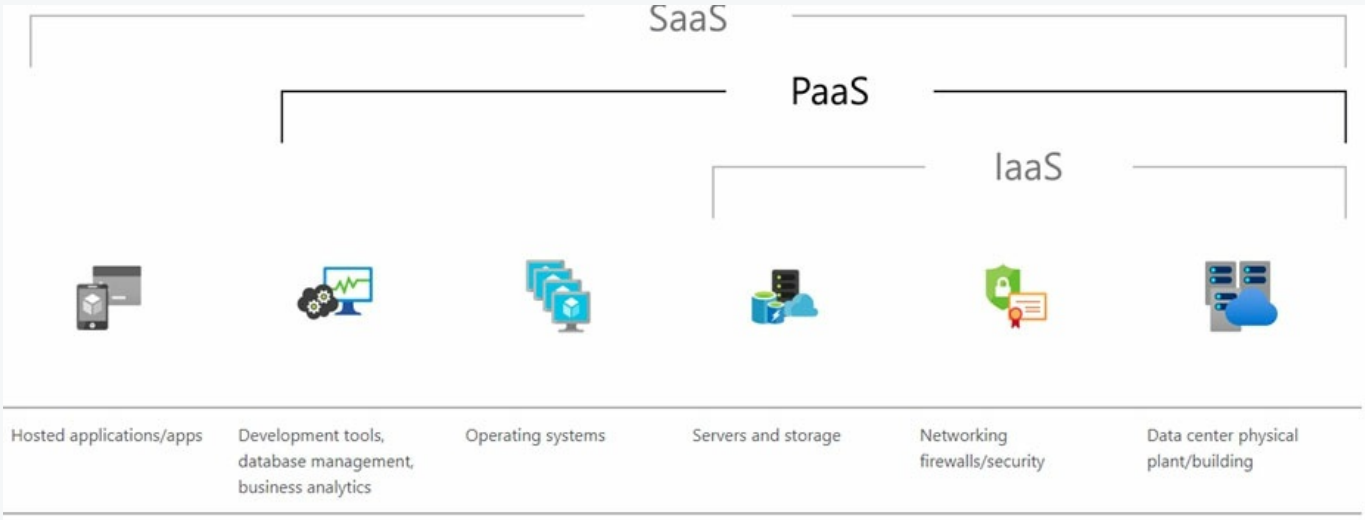


Explanation:

Box 1: Azure Platform as a service (PaaS)

Organizations typically use PaaS for these scenarios:

Development framework. PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. Similar to the way you create an Excel macro, PaaS lets developers create applications using built-in software components. Cloud features such as scalability, high-availability, and multi-tenant capability are included, reducing the amount of coding that developers must do.



Box 2:

Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring, and office tools

(such as Microsoft Office 365).

SaaS provides a complete software solution that you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization, and your users connect to it over the Internet,

usually with a web browser. All of the underlying infrastructure, middleware, app software, and app data are located in the service provider's data center. The service provider manages the hardware and software, and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well. SaaS allows your organization to get quickly up and running with an app at minimal upfront cost.

Reference:

https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 83 CertyIQ

You have an accounting application named App1 that uses a legacy database.
You plan to move App1 to the cloud.
Which service model should you use?

A. platform as a service (PaaS)
B. infrastructure as a service (IaaS)
C. software as a service (SaaS)

IaaS (Infrastructure as a Service) provides virtual machines, networking, and virtual storage with full operating system access and administrative control.

Because legacy software often depends on specific OS versions, deprecated frameworks, local file paths, or custom legacy database engines that are not supported in managed environments, it requires an IaaS deployment (e.g., Azure VMs) to run without significant architectural refactoring.

Answer: B

Explanation:

IaaS as you need to install the legacy software.

Cloud Infrastructure-based Applications " It moves your existing on-premises apps to the Infrastructure as a Service (IaaS) platform or re-hosts them. Lift & Shift is a common term for this type of relocation. The programs will be nearly identical to what they were before, but they will now be able to run on cloud VMs.

Reference:

https://techtaalk.com/microsoft-azure-for-legacy-application-modernization/

Question: 84 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability
- defining scalability rules
- installing the SaaS solution
- configuring the SaaS solution

Answer:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability
- defining scalability rules
- installing the SaaS solution
- configuring the SaaS solution

Explanation:
Box: configuring the Saas Solution
Software as a service (or SaaS) is a way of delivering applications over the Internet"as a service. Instead of installing and maintaining software, you simply access it via the Internet, freeing yourself from complex software and hardware management.
SaaS applications are sometimes called Web-based software, on-demand software, or hosted software. Whatever the name, SaaS applications run on a SaaS provider's servers. The provider manages access to the application, including security, availability, and performance.

Reference:
https://www.salesforce.com/in/saas/

Question: 85 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [ ] cloud.

- hybrid
- multi-vendor
- private
- public

Answer:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [hybrid] cloud.

- hybrid
- multi-vendor
- private
- public

Explanation:
Box: hybrid -
You can deploy hybrid app with on-premises data that scales cross-cloud.

Reference:
https://docs.microsoft.com/en-us/azure/architecture/hybrid/deployments/solution-deployment-guide-cross-

cloud-scaling-onprem-data

Question: 86 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [▼]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Answer:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [▼]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Explanation:
Box: Platform as a service (PaaS)
Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications. You purchase the resources you need from a cloud service provider on a pay- as-you-go basis and access them over a secure Internet connection.
Like IaaS, PaaS includes infrastructure"servers, storage, and networking"but also middleware, development tools, business intelligence (BI) services, database management systems, and more.

Reference:
https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 87 CertyIQ

Which cloud computing model includes on-premises and cloud-based resources?

A. hybrid
B. public
C. private

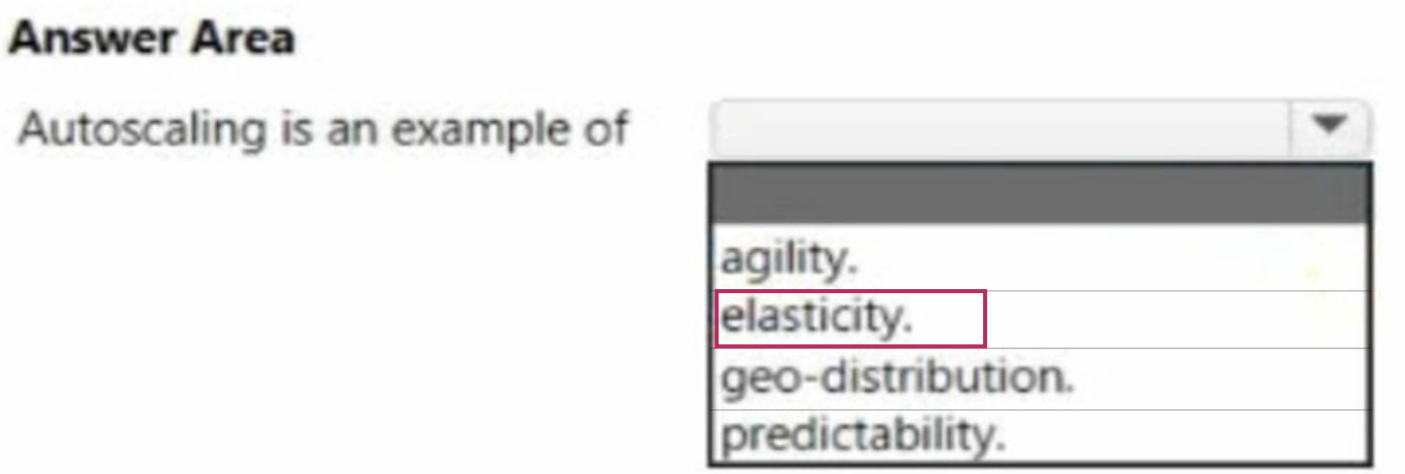
Answer: A

Explanation:
A hybrid cloud " sometimes called a cloud hybrid " is a computing environment that combines an on-premises datacenter (also called a private cloud) with a public cloud, allowing data and applications to be shared between them. Some people define hybrid cloud to include multicloud configurations where an organization uses more than one public cloud in addition to their on-premises datacenter.

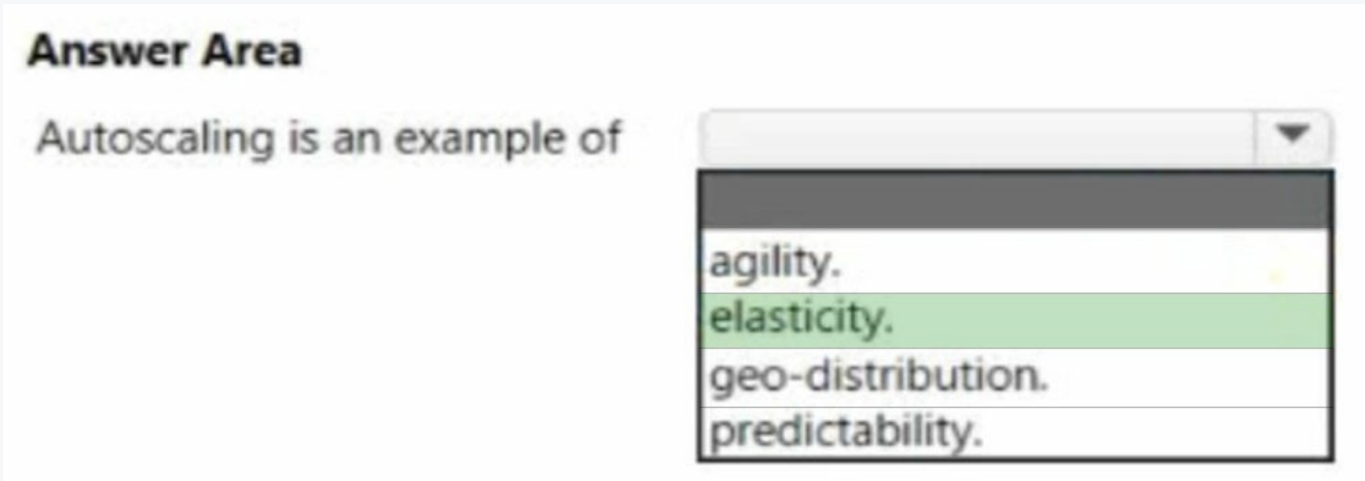
Reference:
https://azure.microsoft.com/en-us/overview/what-is-hybrid-cloud-computing/

Question: 88 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:
An Azure virtual machine scale set can automatically increase or decrease the number of VM instances that run your application. This automated and elastic behavior reduces the management overhead to monitor and optimize the performance of your application.
Also: Azure elasticity as a service is referred to a cloud service that enables in automatically scaling Azure hosted resources in par with the demand and configured parameters. It provides Azure Administrators with the ability to auto scale Azure infrastructure and resources as and when needed.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/virtual-machine-scale-sets-autoscale-overview https://www.netreo.com/cloud-automation/what-is-azure-elasticity-as-a-service/

Question: 89 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Azure Resource Manager (ARM), resource naming scope rules dictate that resources of the same type within the same resource group must have unique names. You cannot create two VNets with the exact same name inside the same resource group.

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Each Azure virtual network in a single resource group must have a unique name.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Answer:

Azure allows you to deploy multiple VNets with identical or overlapping private IP address ranges (e.g., 10.0.0.0/16) in the same subscription. While overlapping address spaces will prevent you from configuring direct VNet peering between those specific networks, the platform does not restrict address space uniqueness at the subscription level.

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Each Azure virtual network in a single resource group must have a unique name.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Explanation:
Box 1: No -
You would need to setup the VNET connections, for example with peering.
Note: You can connect virtual networks to each other with virtual network peering. These virtual networks can be in the same region or different regions (also known as Global VNet peering). Once virtual networks are peered, resources in both virtual networks can communicate with each other.

Box 2: Yes -
All Azure resource types have a scope that defines the level that resource names must be unique. A resource must have a unique name within its scope.
For example, a virtual network has a resource group scope, which means that there can be only one network named vnet-prod-westus-001 in a given resource group.

Box 3: Yes -
As you build your network in Azure, it is important to keep in mind the following universal design principles: Ensure non-overlapping address spaces. Make sure your VNet address space (CIDR block) does not overlap with your organization's other network ranges.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/tutorial-connect-virtual-networks-portal
https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/ready/azure-best-practices/resource-naming

Question: 90 CertyIQ

Which term represents the ability to increase the computing capacity of a virtual machine by adding memory or CPUs?

A. agility
B. vertical scaling
C. horizontal scaling
D. elasticity

Answer: B

Explanation:
Vertical scaling, also known as scale up and scale down, means increasing or decreasing virtual machine (VM) sizes in response to a workload. Compare this behavior with horizontal scaling, also referred to as scale out and scale in, where the number of VMs is altered depending on the workload.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/virtual-machine-scale-sets-vertical-scale-reprovision

Question: 91 CertyIQ

What are two benefits of cloud computing? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. enables the rapid provisioning of resources
B. has increased administrative complexity
C. has the same configuration options as on-premises
D. shifts capital expenditures (CAPEX) to operating expenditures (OPEX)

Answer: AD

Explanation:
Azure allows you to build, deploy, and manage apps more quickly and easily without having to buy and/or maintain the underlying infrastructure.
Azure provides flexibility between CapEx and OpEx
Capital expenditures generate benefits over a long period. These expenditures are generally nonrecurring and result in the acquisition of permanent assets.
Building an application could qualify as a capital expenditure. Example, Azure Reserved Instances (Azure RI) help Azure's most active customers save on long- term VM usage reserving VMs in advance at a discounted price by committing to a one or three-year benefits.
Operating expenditures are ongoing costs of doing business. Consuming cloud services in a pay-as-you-go model could qualify as an operating expenditure.
Example, you pay for a service or product as you use it i.e. pay-as-you-go pricing.

Reference:
https://www.protechtraining.com/blog/post/top-5-benefits-of-microsoft-azure-for-business-934
https://www.azureguru.org/capex-vs-opex/#

Question: 92 CertyIQ

What is a feature of an Azure virtual network?

A. resource cost analysis
B. packet inspection
C. geo-redundancy
D. isolation and segmentation

Isolation and Segmentation: Each VNet is fully isolated from other virtual networks by default. You can further segment the address space into one or more subnets to organize and allocate IP blocks to specific workloads (e.g., separating web tiers, business logic tiers, and database tiers).

Communication: Enabling private communication among Azure resources (like VMs), with on-premises networks (via VPN or ExpressRoute), and the internet.

Answer: D

Explanation:

isolated networking components. Segmented into one or more subnets.

Implement network segmentation patterns on Azure.

A unified enterprise segmentation strategy guides technical teams to consistently segment access using networking, applications, identity, and any other access controls. Create segmentation in your network footprint by defining perimeters.

The main reasons for segmentation are:

The ability to group related assets that are a part of (or support) workload operations.

Isolation of resources.

Governance policies set by the organization.

Reference:

https://docs.microsoft.com/en-us/azure/architecture/framework/security/design-network-segmentation

Question: 93

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

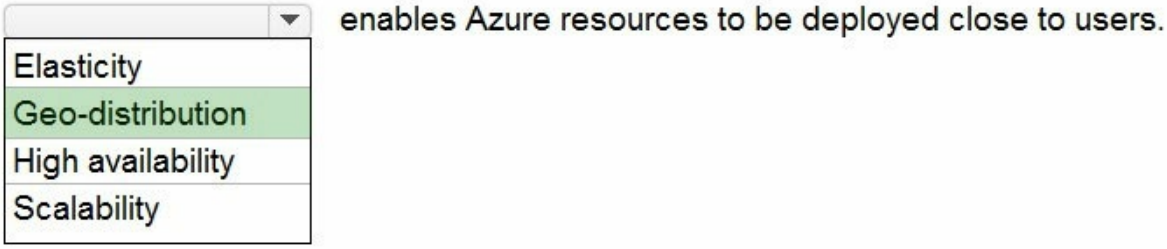
Answer Area

[▼] enables Azure resources to be deployed close to users.

- Elasticity
- Geo-distribution
- High availability
- Scalability

Answer:

Answer Area



Explanation:

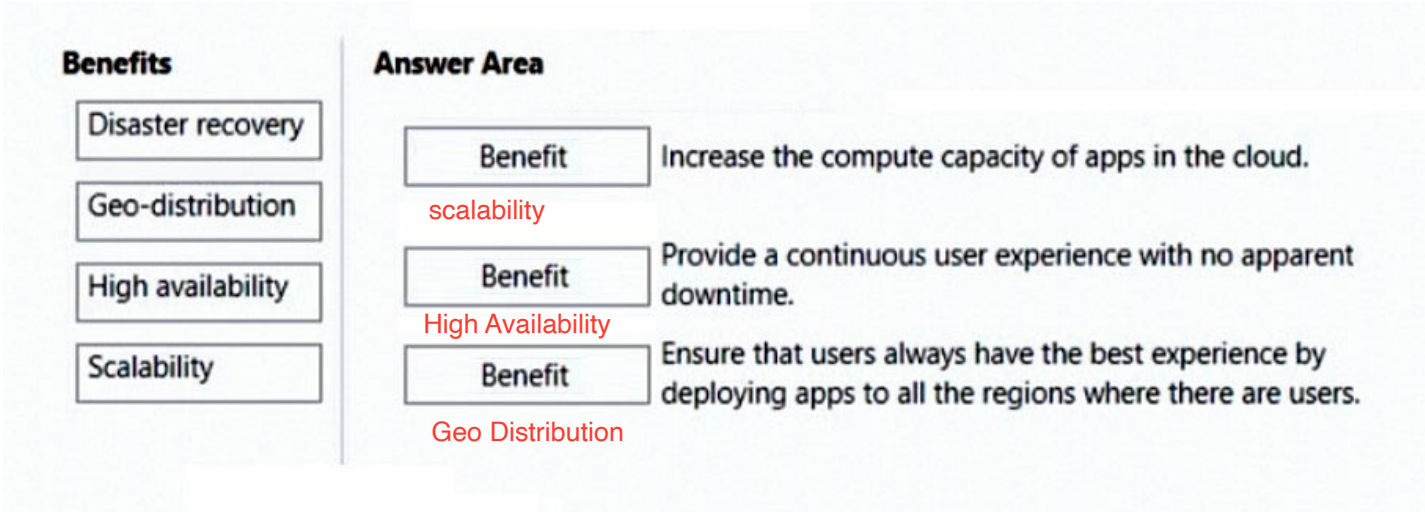
Because of geo-distribution you can deploy apps and data to regional datacenters around the globe, thereby ensuring that your customers always have the best performance in their region.

Reference:

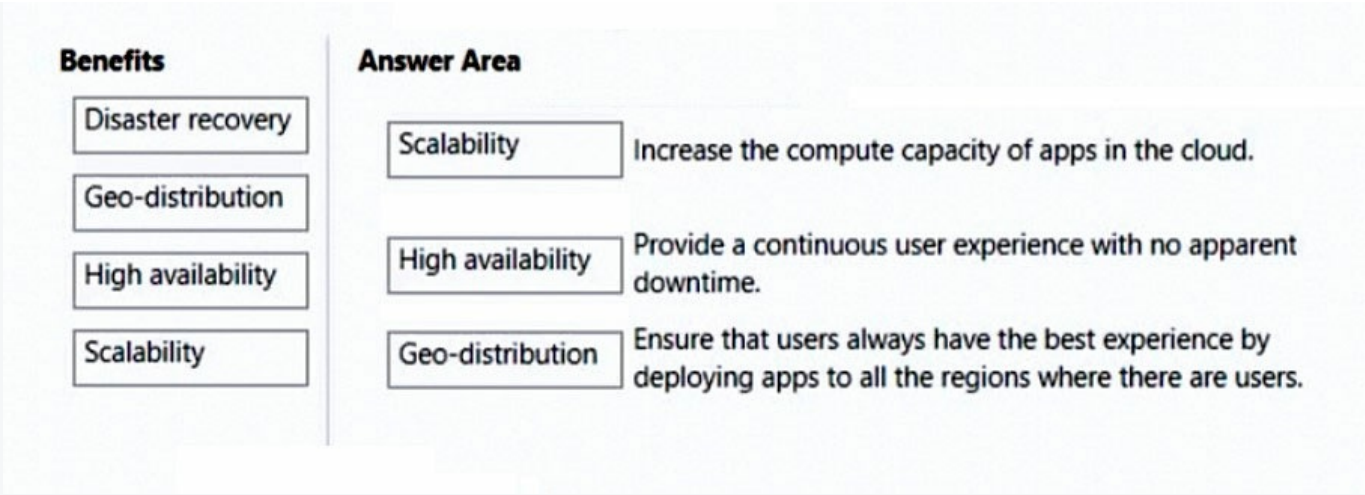
https://docs.microsoft.com/learn/modules/fundamental-azure-concepts/benefits-of-cloud-computing

Question: 94 CertyIQ

DRAG DROP -
Match the cloud computing benefits to the appropriate descriptions.
To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Scalability - Increase the compute capacity of apps in the cloud

High Availability: - Provide a continuous user experience with no apparent downtime

Geo-Distribution - Ensures that users always have the best experience by deploying apps to all the regions where there are users

Reference:

https://docs.microsoft.com/learn/modules/fundamental-azure-concepts/benefits-of-cloud-computing

Question: 95 CertyIQ

Which cloud computing benefit provides continuous user access to a cloud-based application with minimal downtime?

A. agility
B. scalability
C. elasticity
D. high availability

Answer: D

Explanation:

high availability is the only answer that has to do with keeping the applications available to the users.

Question: 96 CertyIQ

You need to identify the type of failure for which an Azure Availability Zone can be used to protect access to Azure services.
What should you identify?

A. a physical server failure
B. an Azure region failure
C. a storage failure

An Availability Zone (AZ) is a physically separate location within an Azure region.

Each Availability Zone is made up of one or more datacenters equipped with independent power, cooling, and networking.

If one datacenter or zone goes down due to an outage (e.g., flood, fire, or total power loss), the remaining zones in that region continue to run and service traffic without interruption. Therefore, Availability Zones are specifically designed to provide resiliency against datacenter-level failures within a region.

D. an Azure data center failure

Answer: D

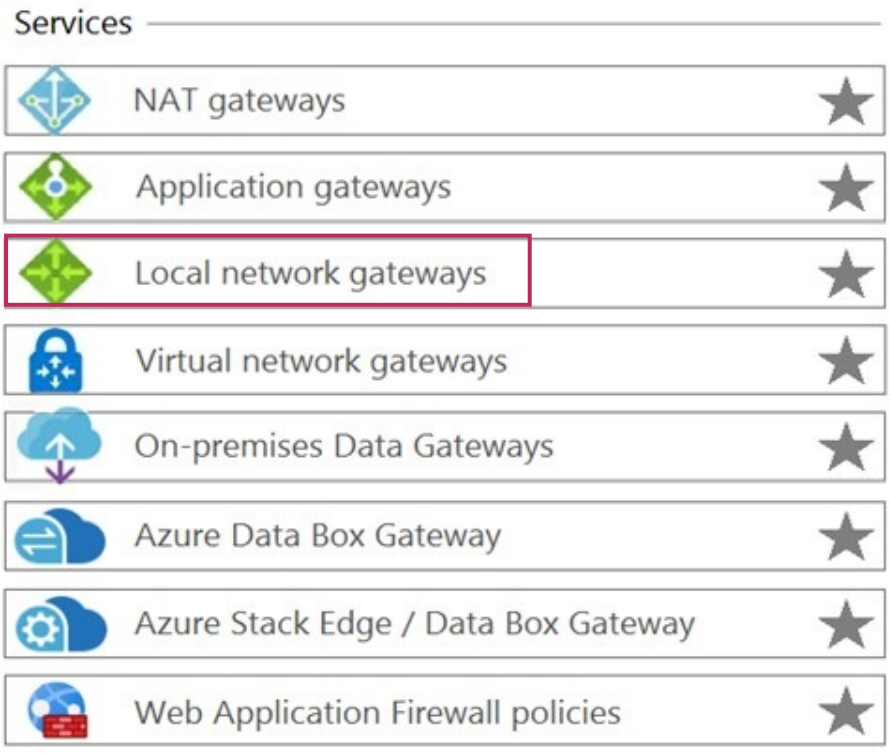
Explanation:
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.
Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/availability

Question: 97 CertyIQ

HOTSPOT -
You plan to extend your company's network to Azure.
The network contains a VPN appliance that uses an IP address of 131.107.200.1.
You need to create an Azure resource that defines the VPN appliance in Azure.
Which Azure resource should you create? To answer, select the appropriate resource in the answer area.
Hot Area:

Answer Area

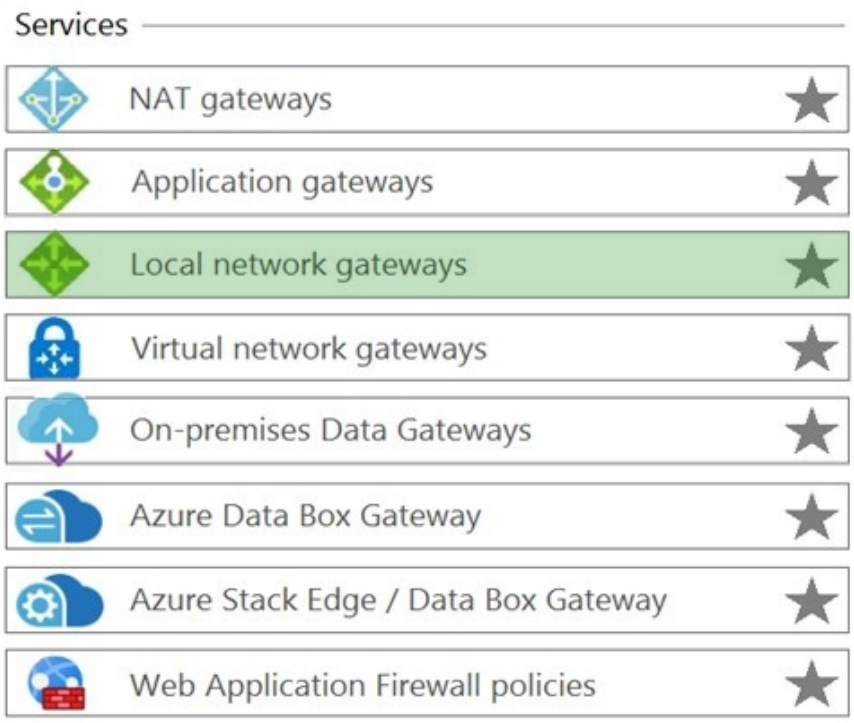


Answer:
The Local Network Gateway is the Azure resource that represents and defines your on-premises edge device (the VPN appliance). It holds the on-premises VPN device's public IP address (such as 131.107.200.1) and the on-premises IP address prefixes that will be routed across the tunnel.

The Virtual Network Gateway (VPN type) represents the software VPN router deployed inside an Azure VNet's dedicated GatewaySubnet.

When configuring the connection, Azure links the Virtual Network Gateway (the Azure end) to the Local Network Gateway (the on-premises appliance end).

Answer Area



Explanation:
A Local Network Gateway is an object in Azure that represents your on-premise VPN device. A Virtual Network Gateway is the VPN object at the Azure end of the
VPN. A 'connection' is what connects the Local Network Gateway and the Virtual Network Gateway to bring up the VPN.
The local network gateway typically refers to your on-premises location. You give the site a name by which Azure can refer to it, then specify the IP address of the on-premises VPN device to which you will create a connection. You also specify the IP address prefixes that will be routed through the VPN gateway to the VPN device. The address prefixes you specify are the prefixes located on your on-premises network. If your on-premises network changes or you need to change the public IP address for the VPN device, you can easily update the values later.

Reference:
https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-howto-site-to-site-resource-manager-portal

Question: 98 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more resource groups.
Does this meet the goal?

A. Yes
B. No

A Resource Group is strictly a logical container used for lifecycle management, billing, role-based access control (RBAC), and organizing Azure resources. It has no physical boundaries and does not influence where the actual hardware or virtual machine hosts are located.

Answer: B

To protect workloads against a single datacenter failure, virtual machines must be distributed across two or more Availability Zones within an Azure region. Each Availability Zone consists of one or more physically separate datacenters with independent power, cooling, and networking infrastructure.

Explanation:

This questions repeated 3 times with different solutions don't get confused here am providing clear cut explaianation :

solution-1: You deploy VM to two or more resource groups (NO)

solution-2: You deploy VM to two or more availability zones(YES)

solution-3: You deploy VM to or more regions (N))

A resource group is a logical container for Azure resources. When you create a resource group, you specify which location to create the resource group in.

However, when you create a virtual machine and place it in the resource group, the virtual machine can still be in a different location (different datacenter).

Therefore, creating multiple resource groups, even if they are in separate datacenters does not ensure that the services running on the virtual machines are available if a single data center fails.

References:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups

Question: 99 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to a scale set.
Does this meet the goal?

A. Yes
B. No

A Virtual Machine Scale Set (VMSS) by default provides elasticity, load balancing, and autoscaling across identical VM instances, but it does not inherently guarantee protection against a datacenter failure unless it is explicitly configured as zone-redundant (spanning multiple Availability Zones).

To protect workloads against a single datacenter failure, virtual machines must be distributed across two or more Availability Zones within an Azure region. Each Availability Zone consists of one or more physically separate datacenters with independent power, cooling, and networking infrastructure.

Answer: B

Explanation:

This answer does not specify that the scale set will be configured across multiple data centers so this solution does not meet the goal.
Azure virtual machine scale sets let you create and manage a group of load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. Scale sets provide high availability to your applications, and allow you to centrally manage, configure, and update many VMs.
Virtual machines in a scale set can be deployed across multiple update domains and fault domains to maximize availability and resilience to outages due to data center outages, and planned or unplanned maintenance events.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/availability

Question: 100 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

In the trust hierarchy between subscriptions and directories, an Azure subscription trusts only one Microsoft Entra ID (Azure AD) tenant at any given time. Conversely, a single directory tenant can trust and manage multiple subscriptions (a 1:N tenant-to-subscription relationship).

Statements	Yes	No
An Azure subscription can be associated to multiple Azure Active Directory (Azure AD) tenants.	○	○
You can change the Azure Active Directory (Azure AD) tenant to which an Azure subscription is associated.	○	○
When an Azure subscription expires, the associated Azure Active Directory (Azure AD) tenant is deleted automatically.	○	○

Answer: Subscriptions and Microsoft Entra ID tenants have separate, independent lifecycles. A tenant is an identity container that can host users, groups, application registrations, and multiple other subscriptions (or Microsoft 365 services). When an individual subscription expires or is canceled, only the resources within that subscription are affected; the directory tenant itself remains intact.

Answer Area

Statements	Yes	No
An Azure subscription can be associated to multiple Azure Active Directory (Azure AD) tenants.	○	○
You can change the Azure Active Directory (Azure AD) tenant to which an Azure subscription is associated.	○	○
When an Azure subscription expires, the associated Azure Active Directory (Azure AD) tenant is deleted automatically.	○	○

Explanation:
Box 1: No -
An Azure AD tenant can have multiple subscriptions but an Azure subscription can only be associated with one Azure AD tenant.

Box 2: Yes -

Box 3: No -
If your subscription expires, you lose access to all the other resources associated with the subscription. However, the Azure AD directory remains in Azure. You can associate and manage the directory using a different Azure subscription.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/fundamentals/active-directory-how-subscriptions-associated-directory

Question: 101 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
Resource groups provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Management groups
C. Azure policies
D. Azure App Service plans

Management Groups are containers positioned above subscriptions to manage access, policy, and compliance across multiple subscriptions efficiently.

Answer:

B

Governance conditions (such as Azure Policy assignments and Azure RBAC roles) applied at the management group level automatically inherit downward to all subscriptions and child resources within that management group hierarchy.

Explanation:

A resource group exists strictly inside a single subscription and cannot span across or govern multiple subscriptions.

"Azure management groups are containers for managing compliances across multiple subscriptions."

Question: 102 CertyIQ

Your company plans to migrate to Azure.
The company has several departments. All the Azure resources used by each department will be managed by a department administrator.
What are two possible techniques to segment Azure for the departments? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. multiple subscriptions
B. multiple Azure Active Directory (Azure AD) directories
C. multiple regions
D. multiple resource groups

Subscriptions (A): An Azure subscription serves as both a billing boundary and an access/administrative boundary. Assigning a dedicated subscription to each department allows the department administrator to have full administrative permissions (such as Owner or Contributor) scoped solely to their department's workloads.

Resource Groups (D): A resource group is a logical container for resources deployed within a subscription. Azure RBAC allows permissions to be assigned directly at the resource group scope, granting department administrators management rights over only their department's resource group without granting access to other groups.

Answer: AD

Explanation:

An Azure subscription is a container for Azure resources. It is also a boundary for permissions to resources and for billing. You are charged monthly for all resources in a subscription. A single Azure tenant (Azure Active Directory) can contain multiple Azure subscriptions.
A resource group is a container that holds related resources for an Azure solution. The resource group can include all the resources for the solution, or only those resources that you want to manage as a group.
To enable each department administrator to manage the Azure resources used by that department, you will need to create a separate subscription per department. You can then assign each department administrator as an administrator for the subscription to enable them to manage all resources in that subscription.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/create-subscription
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/add-change-subscription-administrator

Question: 103 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A single Microsoft account can be used to manage multiple Azure subscriptions.	○	○
Two Azure subscriptions can be merged into a single subscription.	○	○
A company can use resources from multiple subscriptions.	○	○

An identity (whether a personal Microsoft Account [MSA] or a Microsoft Entra ID organizational work/school account) can be granted administrative or RBAC roles (such as Owner, Contributor, or Reader) across multiple independent Azure subscriptions. When signing in to the Azure Portal, that user account can switch between and manage all associated subscriptions

In Azure, subscriptions are distinct billing, identity boundary, and quota containers. You cannot merge or combine two Azure subscriptions into one. While you can move resources individually or in bulk from one subscription to another, the subscriptions themselves remain separate entities and cannot be merged.

Answer: An enterprise organization typically deploys a multi-subscription topology (e.g., separating Production, Development, Testing, or different departments) structured under Management Groups. Workloads and users within the company routinely utilize and interact with resources residing across multiple subscriptions (for example, peering virtual networks across subscriptions or consuming shared services)

Answer Area

Statements	Yes	No
A single Microsoft account can be used to manage multiple Azure subscriptions.	○	○
Two Azure subscriptions can be merged into a single subscription.	○	○
A company can use resources from multiple subscriptions.	○	○

Explanation:
Box 1: Yes -
You can use the same account to manage multiple subscriptions. You can create an additional subscription for your account in the Azure portal. You may want an additional subscription to avoid hitting subscription limits, to create separate environments for security, or to isolate data for compliance reasons.

Box 2: No -
You cannot merge two subscriptions into a single subscription. However, you can move some Azure resources from one subscription to another. You can also transfer ownership of a subscription and change the billing type for a subscription.

Box 3: Yes -
A company can have multiple subscriptions and store resources in the different subscriptions. However, a resource instance can exist in only one subscription.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/create-subscription

Question: 104 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Under Azure Resource Manager (ARM), resources can be moved between resource groups and across different subscriptions within the same Microsoft Entra ID tenant (or even transferred across tenants) using the Azure portal, Azure CLI (az resource move), PowerShell, or REST API.

Virtual machines, their attached managed disks, virtual network interfaces (NICs), and associated virtual network resources are fully supported for cross-subscription movement without needing to rebuild or redeploy them.

Answer Area

You have several virtual machines in an Azure subscription.
You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2016.

Answer:

Answer Area

You have several virtual machines in an Azure subscription.
You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2016.

Explanation:
You can move a VM and its associated resources to a different subscription by using the Azure portal. Moving between subscriptions can be handy if you originally created a VM in a personal subscription and now want to move it to your company's subscription to continue your work. You do not need to start the VM in order to move it and it should continue to run during the move.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/move-vm

Question: 105 CertyIQ

You have an Azure environment that contains multiple Azure virtual machines.
You plan to implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines.
You need to recommend which Azure resources must be created for the planned solution.
Which two Azure resources should you include in the recommendation? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. a virtual network gateway
B. a load balancer
C. an application gateway
D. a virtual network

Virtual Network Gateway (A): The VPN Gateway itself must be deployed into that GatewaySubnet to route encrypted traffic between Azure and the on-premises environment.

E. a gateway subnet

Gateway Subnet (E): The existing virtual network hosting the VMs must contain a dedicated subnet named specifically GatewaySubnet. This subnet is reserved exclusively for the gateway's internal VMs and routing services.

Answer: AE

Explanation:

If you already have Azure VMs, this implies you have a VNet already. Thus the answer should be Gateway Subnet and VNet Gateway

To implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines, you need to configure a

VPN (Virtual Private Network) to connect the on-premises network to the Azure virtual network.

The Azure VPN device is known as a Virtual Network Gateway. The virtual network gateway needs to be located in a dedicated subnet in the Azure virtual network. This dedicated subnet is known as a gateway subnet and must be named 'GatewaySubnet'.

Note: a virtual network (answer D) is also required. However, as we already have virtual machines deployed in a Azure, we can assume that the virtual network is already in place.

References:

https://docs.microsoft.com/en-us/office365/enterprise/connect-an-on-premises-network-to-a-microsoft-azure-virtual-network

Question: 106

CertyIQ

You attempt to create several managed Microsoft SQL Server instances in an Azure environment and receive a message that you must increase your Azure subscription limits.
What should you do to increase the limits?

A. Create a service health alert
B. Upgrade your support plan
C. Modify an Azure policy
D. Create a new support request

Azure subscriptions have default usage limits and quotas on resources (such as vCPU cores, managed instances, and storage accounts) to prevent unintended over-provisioning and manage capacity across datacenters.

To request an increase above the default quota limit, an administrator must open a Service and subscription limit (quota) support request in the Azure portal under

Help + support -> New support request.

Answer: D

Quota increase requests are processed by Microsoft support at no additional charge, even on free/basic subscription tiers.

Explanation:

Many Azure resource have quote limits. The purpose of the quota limits is to help you control your Azure costs. However, it is common to require an increase to the default quota.
You can request a quota limit increase by opening a support request. In the support request, select 'Service and subscription limits (quotas)' for the Issue type, select your subscription and the service you want to increase the quota for. For this question, you would select 'SQL Database Managed Instance' as the quote type.

Reference:
https://docs.microsoft.com/en-us/azure/sql-database/sql-database-managed-instance-resource-limits#obtaining-a-larger-quota-for-sql-managed-instance

Question: 107 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): In classic subscription management and Azure billing hierarchy, an Azure subscription can have only one Account Administrator (the identity responsible for billing ownership and the primary subscription account). While multiple users can be assigned the modern Azure RBAC Owner role or classic Co-Administrator role, the dedicated Account Administrator role is strictly limited to one identity per subscription.

Answer Area

Statements	Yes	No
Each Azure subscription can contain multiple account administrators.	○	○
Each Azure subscription can be managed by using a Microsoft account only.	○	○
An Azure resource group contains multiple Azure subscriptions.	○	○

Answer: Azure subscriptions can be managed by both personal Microsoft accounts (MSA) (e.g., @outlook.com, @live.com) and enterprise organizational/work accounts backed by Microsoft Entra ID (formerly Azure AD). Management is not restricted to personal Microsoft accounts only.

Answer Area

Statements	Yes	No
Each Azure subscription can contain multiple account administrators.	○	○
Each Azure subscription can be managed by using a Microsoft account only.	○	○
An Azure resource group contains multiple Azure subscriptions.	○	○

Explanation:

Box 1: No -

You can assign service administrators and co-administrators in the Azure Portal but there can only be one account administrator.

Box 2: No -

You need an Azure Active Directory account to manage a subscription, not a Microsoft account.

An account is created in the Azure Active Directory when you create the subscription. Further accounts can be created in the Azure Active Directory to manage the subscription.

Box 3: No -

Resource groups are logical containers for Azure resources. However, resource groups do not contain subscriptions. Subscriptions contain resource groups.

Reference:

https://docs.microsoft.com/en-us/office365/enterprise/subscriptions-licenses-accounts-and-tenants-for-microsoft-cloud-offerings

Question: 108 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): Availability Zones are not available in every Azure region. While Microsoft has built zones across all major flagship geographies, some smaller, legacy, specialized, or sovereign regions (e.g., certain government regions or emerging data center locations) do not have multiple physical zones.

Answer Area

Statements	Yes	No
Availability zones can be implemented in all Azure regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Answer: Availability Zones exist within a single Azure region. They provide resiliency and redundancy against data center failures inside that specific region. Replicating data and workloads across multiple regions is handled by cross-region services, Azure Region Pairs, or Geo-redundant storage (GRS), not by Availability Zones.

Answer Area

Statements	Yes	No
Availability zones can be implemented in all Azure regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Explanation:
Box 1: No -
Not all Azure regions support availability zones.

Box 2: No -
Availability zones can be used with many Azure services, not just VMs.

Box 3: No -
Availability Zones are unique physical locations within a single Azure region.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-region#azure-regions-with-availability-zones

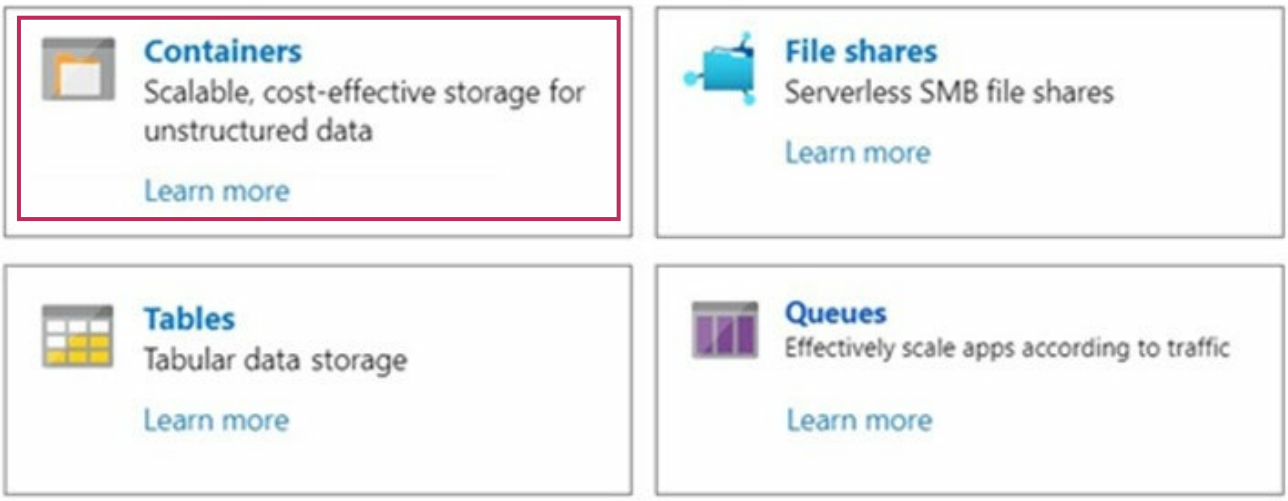
Question: 109 CertyIQ

HOTSPOT -
You plan to create an Azure virtual machine.
You need to identify which storage service must be used to store the unmanaged data disks of the virtual machine.
What should you identify? To answer, select the appropriate service in the answer area.
Hot Area:

Unmanaged disks in Azure are stored as Page Blobs (.vhd files) inside a user-managed Azure Storage Account container.

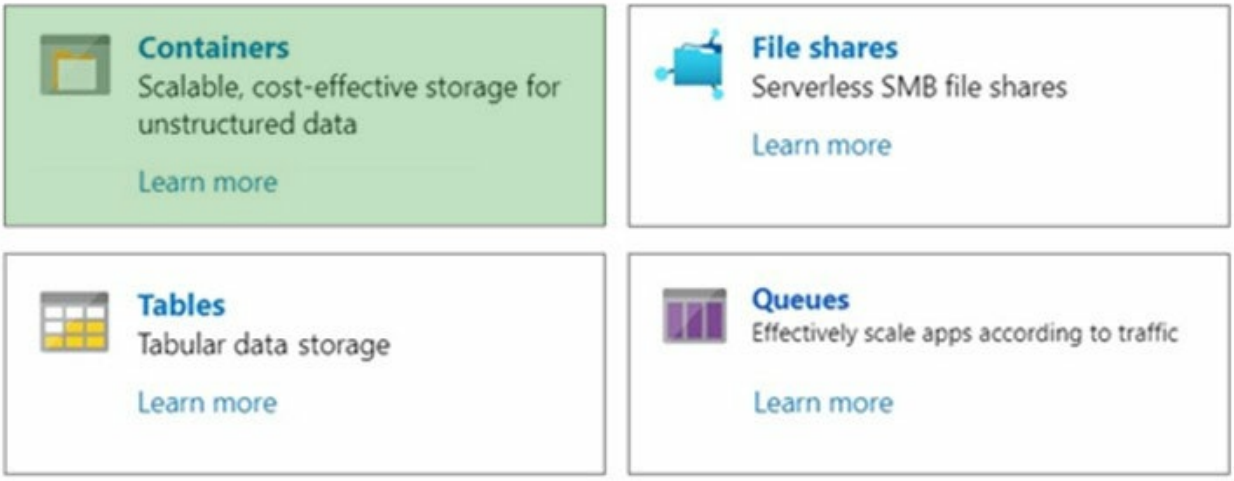
Answer Area

While modern architectures strongly recommend Managed Disks (where Azure automatically provisions and manages the underlying storage account), unmanaged disks require the customer to create an Azure Storage Account and store the VHD files inside a Blob Container



Answer:

Answer Area



Explanation:

Azure containers are the backbone of the virtual disks platform for Azure IaaS. Both Azure OS and data disks are implemented as virtual disks where data is durably persisted in the Azure Storage platform and then delivered to the virtual machines for maximum performance. Azure Disks are persisted in Hyper-V VHD format and stored as a page blob in Azure Storage.

Reference:
https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-pageblob-overview

Question: 110 CertyIQ

Your company plans to move several servers to Azure.
The company's compliance policy states that a server named FinServer must be on a separate network segment.
You are evaluating which Azure services can be used to meet the compliance policy requirements.
Which Azure solution should you recommend?

A. a resource group for FinServer and another resource group for all the other servers
B. a virtual network for FinServer and another virtual network for all the other servers
C. a VPN for FinServer and a virtual network gateway for each other server

D. one resource group for all the servers and a resource lock for FinServer

Answer: B

Explanation:
Networks in Azure are known as virtual networks. A virtual network can have multiple IP address spaces and multiple subnets. Azure automatically routes traffic between different subnets within a virtual network.
The question states that FinServer must be on a separate network segment. The only way to separate FinServer from the other servers in networking terms is to place the server in a different virtual network to the other servers.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/virtual-network-vnet-plan-design-arm

Question: 111 CertyIQ

You plan to map a network drive from several computers that run Windows 10 to Azure Storage.
You need to create a storage solution in Azure for the planned mapped drive.
What should you create?

A. an Azure SQL database
B. a virtual machine data disk
C. a File service in a storage account
D. a Blob service in a storage account

Azure Files (File service in a storage account) offers fully managed cloud file shares accessible via the industry-standard Server Message Block (SMB) and Network File System (NFS) protocols.

Windows client operating systems (like Windows 10) can mount and map an Azure Files share directly as a local network drive (e.g., drive letter Z:) over SMB (port 445), allowing concurrent access across multiple machines simultaneously

Answer: C

Explanation:
Azure Files is Microsoft's easy-to-use cloud file system. Azure file shares can be seamlessly used in Windows and Windows Server.
To use an Azure file share with Windows, you must either mount it, which means assigning it a drive letter or mount point path, or access it via its UNC path.
Unlike other SMB shares you may have interacted with, such as those hosted on a Windows Server, Linux Samba server, or NAS device, Azure file shares do not currently support Kerberos authentication with your Active Directory (AD) or Azure Active Directory (AAD) identity, although this is a feature we are working on.
Instead, you must access your Azure file share with the storage account key for the storage account containing your Azure file share. A storage account key is an administrator key for a storage account, including administrator permissions to all files and folders within the file share you're accessing, and for all file shares and other storage resources (blobs, queues, tables, etc) contained within your storage account.

Reference:
https://docs.microsoft.com/en-us/azure/storage/files/storage-how-to-use-files-windows

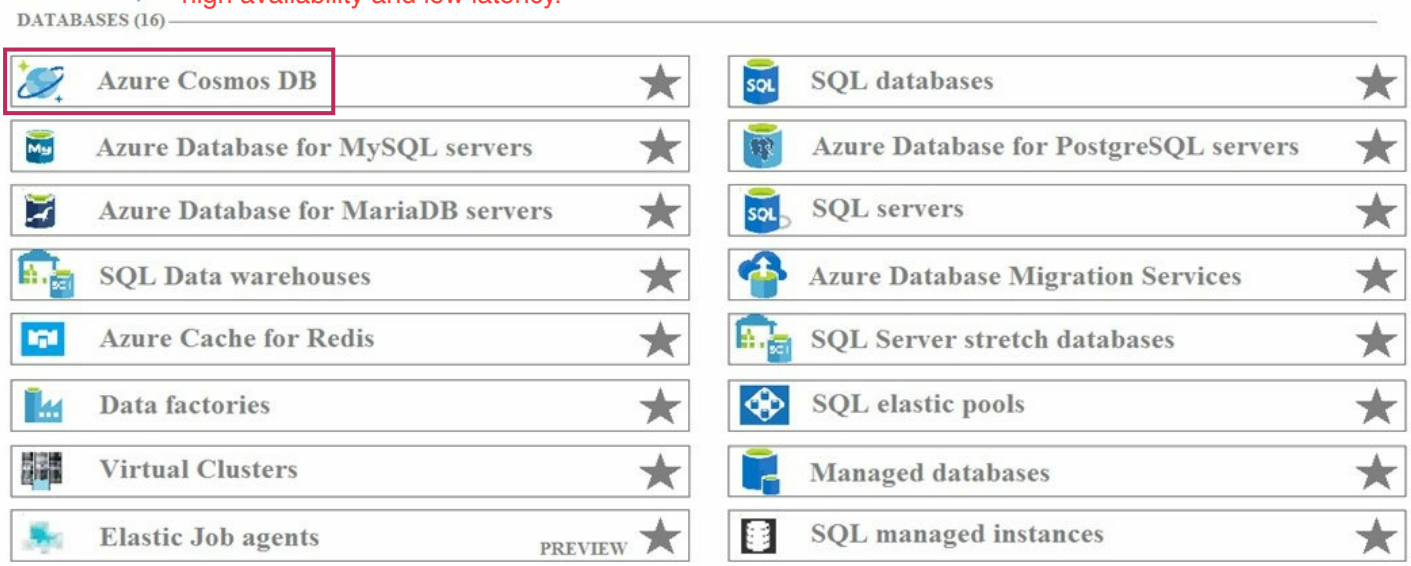
Question: 112 CertyIQ

HOTSPOT -
You plan to implement an Azure database solution.
You need to implement a database solution that meets the following requirements:
- Can add data concurrently from multiple regions
- Can store JSON documents

Which database service should you deploy? To answer, select the appropriate service in the answer area.

Hot Area:

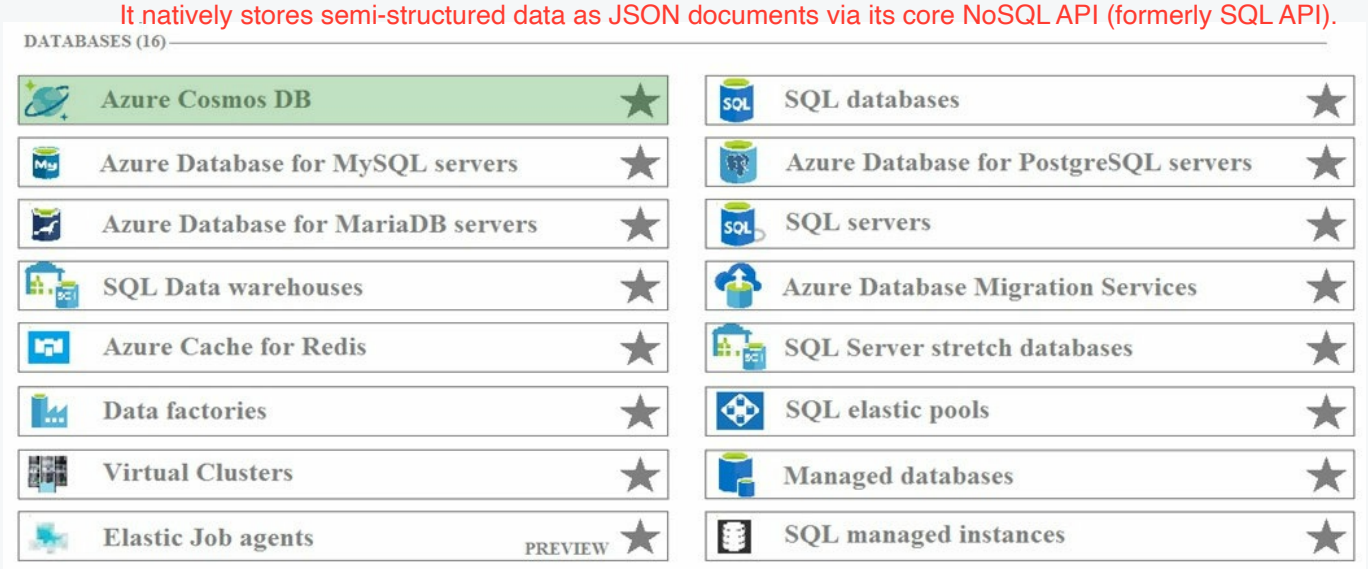
Azure Cosmos DB is Microsoft's globally distributed, multi-model NoSQL database service designed for high availability and low latency.



It natively supports multi-region writes (allowing applications to write and add data concurrently across multiple Azure regions with automatic conflict resolution).

Answer:

It natively stores semi-structured data as JSON documents via its core NoSQL API (formerly SQL API).



Explanation:

Azure Cosmos DB is Microsoft's globally distributed, multi-model database service. With a click of a button, Cosmos DB enables you to elastically and independently scale throughput and storage across any number of Azure regions worldwide.

Azure Cosmos DB is a great way to store unstructured and JSON data. Combined with Azure Functions, Cosmos DB makes storing data quick and easy with much less code than required for storing data in a relational database.

Reference:

https://docs.microsoft.com/en-us/azure/cosmos-db/introduction https://docs.microsoft.com/en-us/azure/azure-functions/functions-integrate-store-unstructured-data-cosmosdb?tabs=csharp

Question: 113

CertyIQ

Your company plans to start using Azure and will migrate all its network resources to Azure.
You need to start the planning process by exploring Azure.
What should you create first?

A. a subscription

B. a resource group

An Azure Subscription provides authenticated and authorized access to Azure cloud products and services. It serves as the primary billing boundary and the foundational container required before provisioning any cloud assets. You cannot create a resource group, deploy a virtual network, or organize subscriptions under management groups without first establishing an active Azure subscription tied to an account and payment model.

C. a virtual network

D. a management group

Answer: A

Explanation:
The first thing you create in Azure is a subscription. You can think of an Azure subscription as an 'Azure account'. You get billed per subscription.
A subscription is an agreement with Microsoft to use one or more Microsoft cloud platforms or services, for which charges accrue based on either a per-user license fee or on cloud-based resource consumption.
✑ Microsoft's Software as a Service (SaaS)-based cloud offerings (Office 365, Intune/EMS, and Dynamics 365) charge per-user license fees.
✑ Microsoft's Platform as a Service (PaaS) and Infrastructure as a Service (IaaS) cloud offerings (Azure) charge based on cloud resource consumption.
You can also use a trial subscription, but the subscription expires after a specific amount of time or consumption charges. You can convert a trial subscription to a paid subscription.
Organizations can have multiple subscriptions for Microsoft's cloud offerings.

Reference:
https://docs.microsoft.com/en-us/office365/enterprise/subscriptions-licenses-accounts-and-tenants-for-microsoft-cloud-offerings

Question: 114 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

A resource group has its own location to store its metadata, but the resources placed inside it do not need to be in the same region as the resource group or each other. You can deploy a virtual machine in East US and a storage account in West Europe into the exact same resource group.

Statements	Yes	No
All the Azure resources deployed to a resource group must use the same Azure region.	○	○
If you assign a tag to a resource group, all the Azure resources in that resource group are assigned to the same tag.	○	○

When you assign a user permissions at the resource group level (e.g., Contributor or Owner), those permissions are automatically inherited by all child resources contained within that resource group.

If you assign permissions for a user to manage a resource group, the user can manage all the Azure resources in that resource group.	○	○

Answer:

Answer Area

Statements	Yes	No
All the Azure resources deployed to a resource group must use the same Azure region.	○	●
If you assign a tag to a resource group, all the Azure resources in that resource group are assigned to the same tag.	○	●
If you assign permissions for a user to manage a resource group, the user can manage all the Azure resources in that resource group.	●	○

Explanation:

Box 1: No -

Azure resources deployed to a single resource group can be located in different regions. The resource group only contains metadata about the resources it contains.

When creating a resource group, you need to provide a location for that resource group. You may be wondering, "Why does a resource group need a location?

And, if the resources can have different locations than the resource group, why does the resource group location matter at all?" The resource group stores metadata about the resources. When you specify a location for the resource group, you're specifying where that metadata is stored. For compliance reasons, you may need to ensure that your data is stored in a particular region.

Box 2: No -

Tags for Resources are not inherited by default from their Resource Group

Box 3: Yes -

A resource group can be used to scope access control for administrative actions. By default, permissions set at the resource level are inherited by the resources in the resource group.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview

Question: 115 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Azure Blob Storage provides online tiers (Hot and Cool) and an offline tier (Archive).

Answer Area

The Archive access tier is an offline storage tier optimized for data that is rarely accessed and can tolerate retrieval latency of several hours.

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Answer:

While a blob is in the Archive tier, it is offline and cannot be directly read, downloaded, or modified. To read or access the data, you must first change the tier to an online tier (Hot or Cool) or copy it to an online tier—a process officially defined in Azure as blob rehydration.

Answer Area

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Explanation:
Azure storage offers different access tiers: hot, cool and archive.
The archive access tier has the lowest storage cost. But it has higher data retrieval costs compared to the hot and cool tiers. Data in the archive tier can take several hours to retrieve.
While a blob is in archive storage, the blob data is offline and can't be read, overwritten, or modified. To read or download a blob in archive, you must first rehydrate it to an online tier.
Example usage scenarios for the archive access tier include:
- Long-term backup, secondary backup, and archival datasets
- Original (raw) data that must be preserved, even after it has been processed into final usable form.
- Compliance and archival data that needs to be stored for a long time and is hardly ever accessed.

Reference:
https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers?tabs=azure-portal#archive-access-tier

Question: 116 CertyIQ

HOTSPOT -
You plan to deploy a critical line-of-business application to Azure.
The application will run on an Azure virtual machine.
You need to recommend a deployment solution for the application. The solution must provide a guaranteed availability of 99.99 percent.

What is the minimum number of virtual machines and the minimum number of availability zones you should recommend for the deployment? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

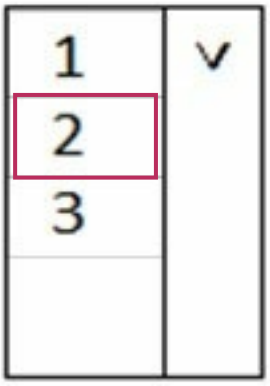
Answer Area

Minimum number of virtual machines:

99.9% / 99.5%: Applies to a single VM using Premium SSD / Ultra Disk storage.

Therefore, to reach the 99.99% threshold with the minimum footprint, you need at least 2 virtual machines distributed across at least 2 availability zones (1 VM per zone).

Minimum number of availability zones:

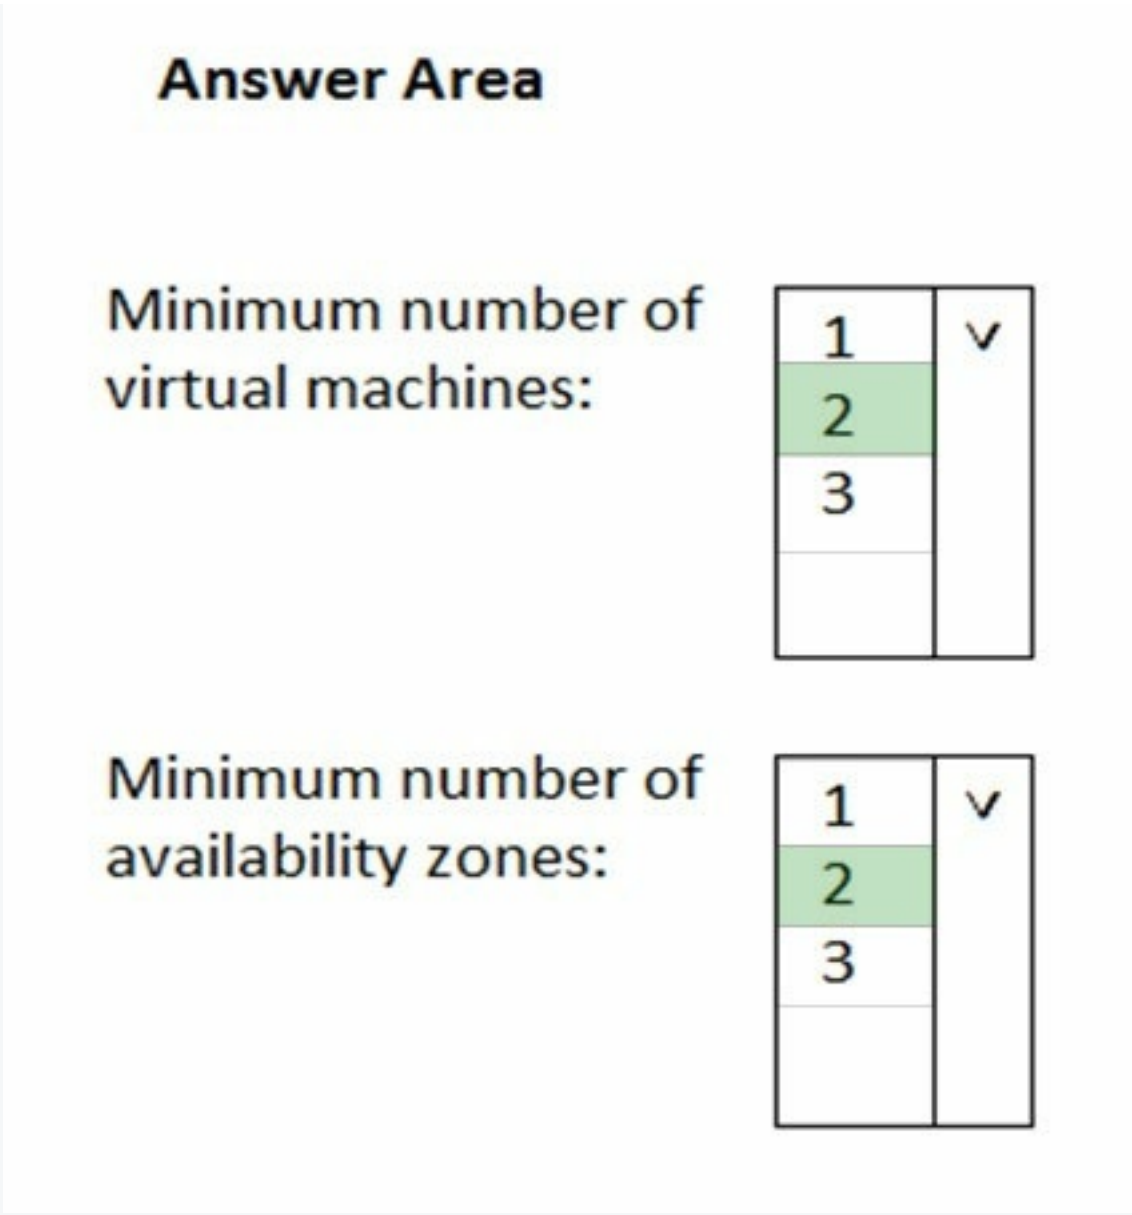


According to the official Microsoft Service Level Agreements (SLA) for Virtual Machines:

99.99% (Four Nines): Requires at least two or more instances deployed across two or more Availability Zones in the same Azure region.

99.95%: Requires two or more instances deployed across separate Fault and Update Domains within the same Availability Set.

Answer:



Explanation:
You need a minimum of two virtual machines with each one located in a different availability zone. Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there's a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures. Zone-redundant services replicate your applications and data across Availability Zones to protect from single-points-of-failure. With Availability Zones, Azure offers industry best 99.99% VM uptime SLA.

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 117 CertyIQ

Which Azure service should you use to collect events from multiple resources into a centralized repository?

A. Azure Event Hubs
B. Azure Analysis Services
C. Azure Monitor
D. Azure Stream Analytics

Azure Event Hubs is a fully managed, real-time data ingestion service (event streaming platform) capable of receiving and processing millions of events per second from distributed sources and resources. It acts as a centralized repository and front door for streaming architectures, allowing incoming event telemetry to be stored, buffered, and forwarded to downstream analytics or processing services.

Answer: A

Explanation:

keyword is "event" and not just any telemetry data.

"Azure Event Hubs — A big data streaming platform and event ingestion service"

https://docs.microsoft.com/en-us/azure/event-hubs/event-hubs-about

Question: 118 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

An Availability Zone in Azure has physically separate locations [▼]

- across two continents.
- within a single Azure region.
- within multiple Azure regions.
- within a single Azure datacenter.

An Availability Zone is a high-availability offering that protects applications and data from datacenter failures.
Availability Zones are unique, physically separate locations within a single Azure region.
Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking infrastructure, connected to each other through a dedicated high-speed, low-latency private fiber network.

Answer:

Answer Area

An Availability Zone in Azure has physically separate locations [▼]

- across two continents.
- within a single Azure region.
- within multiple Azure regions.
- within a single Azure datacenter.

Explanation:
Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 119 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Cross-datacenter redundancy is not automatic for all configurations. Under LRS, all three copies remain entirely within the same physical data center. To replicate data across separate facilities, the customer must intentionally configure Zone-Redundant Storage (ZRS) (spanning three availability zones/datacenters within the region) or Geo-Redundant Storage (GRS) (replicating to a paired secondary region).

Answer Area

Statements	Yes	No
Data that is stored in an Azure Storage account automatically has at least three copies.	○	○
All data that is copied to an Azure Storage account is backed up automatically to another Azure data center.	○	○
An Azure Storage account can contain up to 2 TB of data and up to one million files.	○	○

Answer: Standard Azure general-purpose v2 storage accounts have a maximum capacity of 5 PiB (petabytes), and there is no artificial ceiling of one million files. The 2 TB limit is an obsolete restriction from legacy services (such as early StorSimple or very early cloud backup volumes) and does not apply to Azure Storage accounts.

Answer Area

Statements	Yes	No
Data that is stored in an Azure Storage account automatically has at least three copies.	○	○
All data that is copied to an Azure Storage account is backed up automatically to another Azure data center.	○	○
An Azure Storage account can contain up to 2 TB of data and up to one million files.	○	○

Explanation:

Box 1: Yes -

There are different replication options available with a storage account. The 'minimum' replication option is Locally Redundant Storage (LRS). With LRS, data is replicated synchronously three times within the primary region.

Box 2: No -

Data is not backed up automatically to another Azure Data Center although it can be depending on the replication option configured for the account. Locally

Redundant Storage (LRS) is the default which maintains three copies of the data in the data center.

Geo-redundant storage (GRS) has cross-regional replication to protect against regional outages. Data is replicated synchronously three times in the primary region, then replicated asynchronously to the secondary region.

Box 3: No -

The limits are much higher than that. The current storage limit is 2 PB for US and Europe, and 500 TB for all other regions (including the UK) with no limit on the number of files.

Reference:

https://docs.microsoft.com/en-us/azure/storage/common/storage-account-overview

Question: 120 CertyIQ

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Not all Azure regions support Availability Zones. While Microsoft features availability zones across major standard geographies, certain legacy, specialized, satellite, or sovereign cloud regions do not have multiple isolated physical datacenter zones. Deploying resources across every region does not change regional physical architecture or make zones universally available.

Answer Area

Statements	Yes	No
If you have Azure resources deployed to every region, you can implement availability zones in all the regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Answer: Availability Zones are designed for intra-region resiliency, providing isolation across datacenters within a single Azure region. Replication of data and applications across multiple regions is achieved through cross-region mechanisms, such as Azure Region Pairs, Geo-Redundant Storage (GRS), or global load balancing (e.g., Azure Front Door, Azure Traffic Manager).

Answer Area

Statements	Yes	No
If you have Azure resources deployed to every region, you can implement availability zones in all the regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Explanation:

Box 1: No -

Not all Azure regions support availability zones.

Box 2: No -

Regions that support availability zones support Linux virtual machines.

Box 3: No

Availability zones are used to replicate data and applications in the same region.

Question: 121 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

North America contains numerous Azure regions across the United States, Canada, and Mexico (e.g., East US, East US 2, West US, Central US, Canada Central, Mexico Central). A geography like North America is never represented by just a single region.

By definition, an Azure region is a geographical perimeter containing at least one datacenter, but not necessarily multiple physical datacenters. While regions with Availability Zones contain multiple datacenters, certain smaller, legacy, or specialized regions may comprise a single datacenter facility.

Answer Area

Statements	Yes	No
North America is represented by a single Azure region.	○	○
Every Azure region has multiple datacenters.	○	○
Data transfers between Azure services located in different Azure regions are always free.	○	○

Inbound data transfers to Azure datacenters are generally free, but outbound data transfers (egress) and cross-region data transfers (such as traffic traversing global VNet peering or inter-region replication) incur bandwidth and data egress charges. They are not free.

Answer:

Answer Area

Statements	Yes	No
North America is represented by a single Azure region.	○	○
Every Azure region has multiple datacenters.	○	○
Data transfers between Azure services located in different Azure regions are always free.	○	○

Explanation:

Box 1: No -

North America has several Azure regions, including West US, Central US, South Central US, East Us, and Canada East.

Box 2: No

A region is a geographical area on the planet that contains at least one, but potentially multiple datacenters that are nearby and networked together with a low-latency network. Azure intelligently assigns and controls the resources within each region to ensure workloads are appropriately balanced.

Box 3: No -

Outbound data transfer is charged at the normal rate and inbound data transfer is free.

Reference:

https://www.pragimtech.com/blog/azure/azure-regions-and-paired-regions/

Question: 122 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct

solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more scale sets.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

An availability set is a logical grouping of VMs within a datacenter. You will have to use availability zones. Hence B answer.

This answer does not specify that the scale set will be configured across multiple data centers so this solution does not meet the goal.

Azure virtual machine scale sets let you create and manage a group of load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. Scale sets provide high availability to your applications, and allow you to centrally manage, configure, and update many VMs.

Virtual machines in a scale set can be deployed across multiple update domains and fault domains to maximize availability and resilience to outages due to data center outages, and planned or unplanned maintenance events.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/availability

Question: 123 CertyIQ

You need to be notified when Microsoft plans to perform maintenance that can affect the resources deployed to an Azure subscription.
What should you use?

A. Azure Monitor
B. Azure Service Health
C. Azure Advisor
D. Microsoft Trust Center

Azure Service Health provides personalized guidance and support when Azure service issues, outages, planned maintenance events, or health advisories affect your specific Azure subscriptions and deployed resources.

It includes:
Azure Status: Global view of the health of Azure services across all regions.

Service Health: Personalized dashboard tracking issues affecting your specific services and subscriptions.

Resource Health: Detailed diagnostics on the health of individual resource instances (e.g., a specific VM instance).

Planned Maintenance: Advanced warnings and scheduling for maintenance windows that Microsoft performs on underlying hardware and infrastructure.

Answer: B

Explanation:

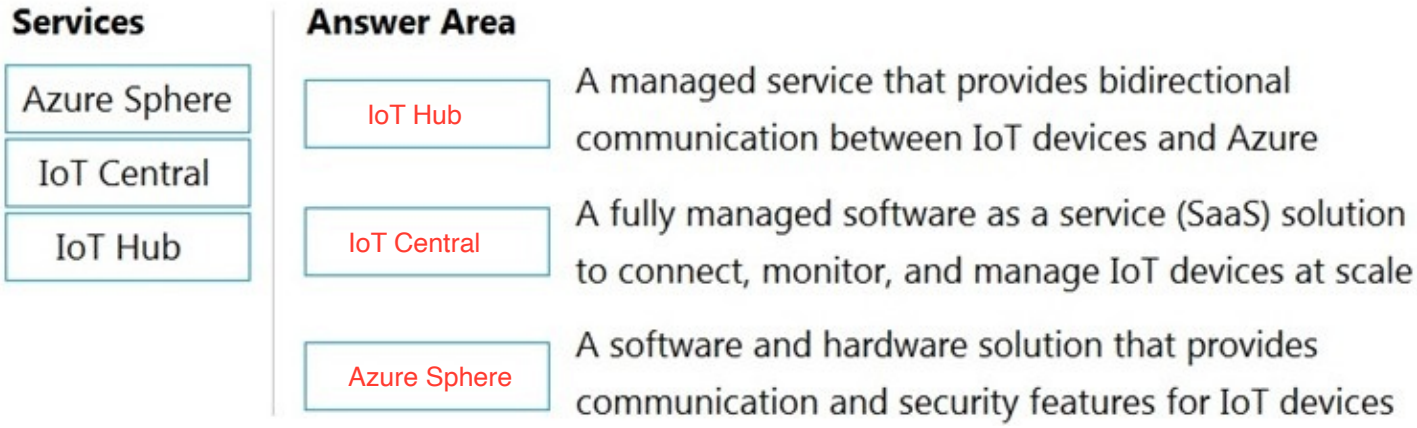
Azure Service Health provides a personalized view of the health of the Azure services and regions you're using. This is the best place to look for service impacting communications about outages, planned maintenance activities, and other health advisories because the authenticated Service Health experience knows which services and resources you currently use.

Reference:

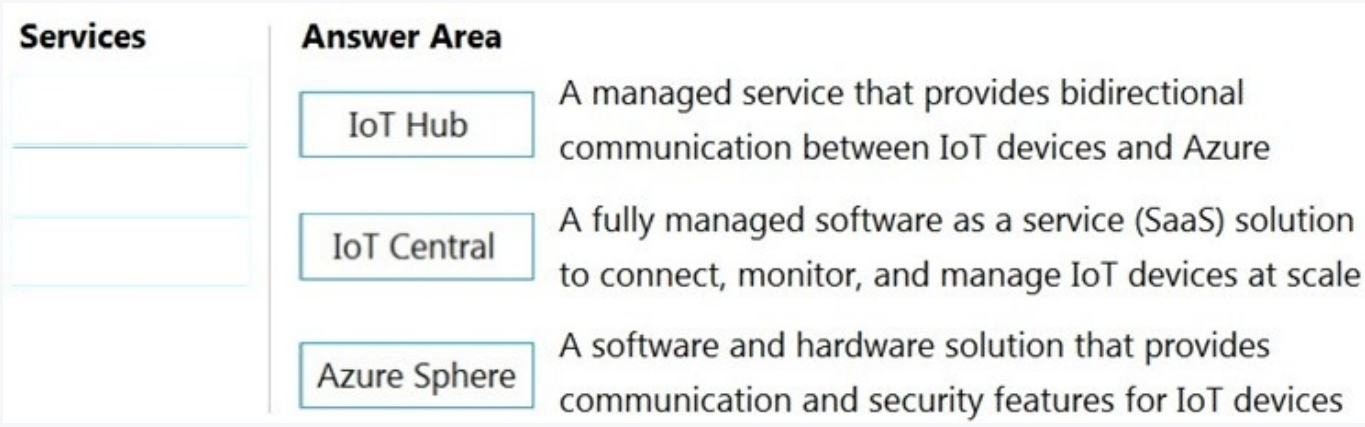
https://docs.microsoft.com/en-us/azure/service-health/overview

Question: 124 CertyIQ

DRAG DROP -
Match the Azure Services service to the correct description.
Instructions: To answer, drag the appropriate service from the column on the left to its description on the right.
Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:



Answer:



Explanation:

1. IoT Hub $\rightarrow$ A managed service that provides bidirectional communication between IoT devices and Azure Azure IoT Hub is a core Platform as a Service (PaaS) offering that acts as a central message hub for secure, bi-directional communication between millions of IoT devices and a cloud backend.Key Context: It supports data ingestion from devices to the cloud (telemetry) as well as command-and-control messaging from the cloud back down to specific devices. It serves as the underlying engineering foundation for more complex IoT architectures.

2. IoT Central $\rightarrow$ A fully managed software as a service (SaaS) solution to connect, monitor, and manage IoT devices at scale : Azure IoT Central simplifies the deployment process by offering an out-of-the-box, web-based SaaS dashboard interface.Key Context: Unlike IoT Hub (which requires you to write custom code and connect separate data stream services manually), IoT Central provides built-in industry templates, ready-made monitoring dashboards, and rules engines. It is designed for organizations that want to connect and manage devices at scale without needing deep cloud architecture or backend development expertise.

3. Azure Sphere $\rightarrow$ A software and hardware solution that provides communication and security

features for IoT devices Azure Sphere is an end-to-end, high-security ecosystem specifically engineered to protect internet-connected microcontrollers (MCUs) from digital and physical threats.Key Context: It is unique because it spans three distinct components:Hardware: Certified hardware chips (secure MCUs) built by silicon partners.Software: A custom, highly secured, defense-in-depth Linux-based operating system designed by Microsoft.Cloud Service: The Azure Sphere Security Service, which continuously monitors connected devices for emerging threats, handles secure certificate-based authentication, and deploys verified software updates.

Reference:

https://docs.microsoft.com/en-us/azure-sphere/product-overview/what-is-azure-sphere https://docs.microsoft.com/en-us/azure/iot-central/core/overview-iot-central https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub

Question: 125 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Session hosts in Azure Virtual Desktop (formerly Windows Virtual Desktop) are not restricted to Windows 10. They support multiple operating systems, including Windows 11 Enterprise multi-session, Windows 10 Enterprise multi-session, Windows Server (2012 R2, 2016, 2019, 2022), and single-session Windows client images.

Statements	Yes	No
A Windows Virtual Desktop session host can run Windows 10 only.	○	○
A Windows Virtual Desktop host pool that includes 20 session hosts supports a maximum of 20 simultaneous user connections.	○	○
Windows Virtual Desktop supports desktop and app virtualization.	○	○

Answer:

Azure Virtual Desktop supports Windows 10/11 Enterprise multi-session, which allows multiple concurrent users to sign in and run workloads on a single virtual machine host simultaneously. A host pool with 20 session hosts using multi-session configurations can easily support hundreds of concurrent user sessions, depending on VM compute sizing and workload limits.

Answer Area

Azure Virtual Desktop: It can deliver full desktop experiences (personal or pooled desktops) as well as publish individual virtualized applications (RemoteApp) to end-user devices.

Statements	Yes	No
A Windows Virtual Desktop session host can run Windows 10 only.	○	○
A Windows Virtual Desktop host pool that includes 20 session hosts supports a maximum of 20 simultaneous user connections.	○	○
Windows Virtual Desktop supports desktop and app virtualization.	○	○

Explanation:

1. NO - Supported O/Ses are Windows 10 Enterprise multi-session or Windows 10 Enterprise, Windows 7 Enterprise, Windows Server 2012 R2, 2016, 2019. See https://docs.microsoft.com/en-us/azure/virtual-desktop/overview#requirements

2. NO - For Max session limit, enter the maximum number of users you want load-balanced to a single session host. See https://docs.microsoft.com/en-us/azure/virtual-desktop/create-host-pools-azure-

marketplace#begin-the-host-pool-setup-process and https://docs.microsoft.com/en-us/windows-server/remote/remote-desktop-services/virtual-machine-recs?context=/azure/virtual-desktop/context/context#recommended-vm-sizes-for-standard-or-larger-environments

3. YES- Via RemoteApps See https://docs.microsoft.com/en-us/azure/virtual-desktop/manage-app-groups

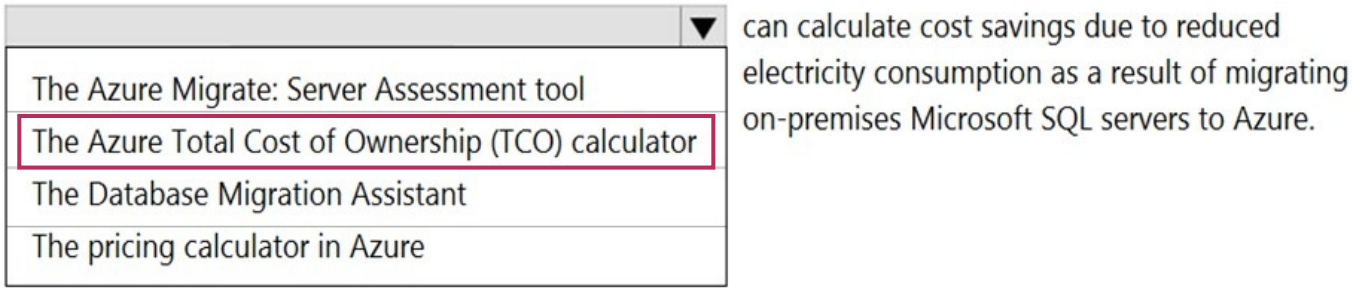
Reference:

https://docs.microsoft.com/en-us/azure/virtual-desktop/overview

Question: 126 CertyIQ

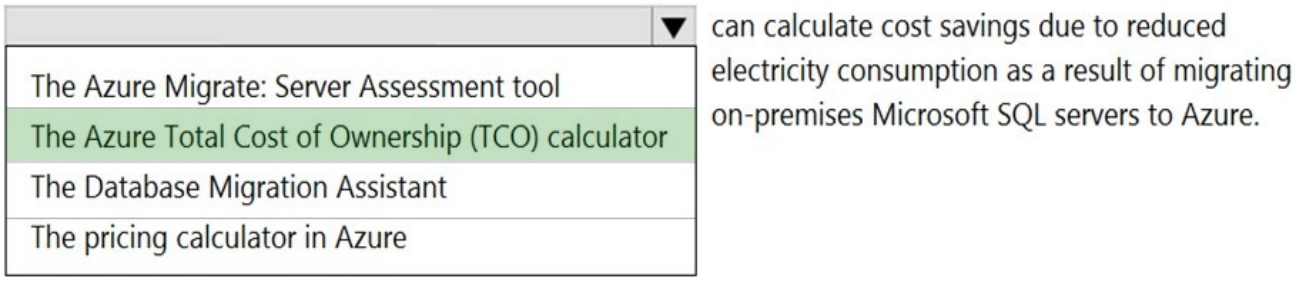
HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

The Azure Total Cost of Ownership(TCO) Calculator is used to estimate the cost savings you can achieve by migrating your application workloads to Microsoft

https://blog.abouttmc.com/azure-cloud-total-cost-of-ownership

Question: 127 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

An Availability Zone is physically separated into one or more distinct datacenters with independent power, cooling, and networking within an Azure region. Deploying virtual machines across multiple Availability Zones ensures that if an entire datacenter facility fails, virtual machine instances running in another zone continue to operate.

Statements	Yes	No
You can use Availability Zones in Azure to protect Azure virtual machines from a datacenter failure.	○	○
You can use Availability Zones in Azure to protect Azure virtual machines from a region failure.	○	○
You can use Availability Zones in Azure to protect Azure managed disks from a datacenter failure.	○	○

Answer:

Azure Managed Disks offer Zone-Redundant Storage (ZRS) options. A ZRS managed disk synchronously replicates data across three separate Availability Zones within the primary region. Even for standard locally zoned disks attached to zonal VMs, spreading managed disks across availability zones shields the underlying storage and data workloads from the physical failure of an individual datacenter.

Answer Area

Statements	Yes	No
You can use Availability Zones in Azure to protect Azure virtual machines from a datacenter failure.	○	○
You can use Availability Zones in Azure to protect Azure virtual machines from a region failure.	○	○
You can use Availability Zones in Azure to protect Azure managed disks from a datacenter failure.	○	○

Explanation:

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there are a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures.

With Availability Zones, Azure offers industry best 99.99% VM uptime SLA. By architecting your solutions to use replicated VMs in zones, you can protect your applications and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/manage-availability

Question: 128 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
An Azure subscription can have multiple account administrators	○	○
An Azure subscription can be managed by using a Microsoft account only	○	○
An Azure resource group can contain multiple Azure subscriptions	○	○

Answer:

Answer Area

Statements	Yes	No
An Azure subscription can have multiple account administrators	○	○
An Azure subscription can be managed by using a Microsoft account only	○	○
An Azure resource group can contain multiple Azure subscriptions	○	○

Explanation:

Box 1 : No

You can assign service administrators and co-administrators in the Azure Portal but there can only be one account administrator.

Box2:No

Azure subscriptions can be managed using both:

Microsoft accounts (e.g., personal accounts like Outlook/Hotmail).

Azure Active Directory (AAD) accounts, which are organizational accounts.

Limiting management to only Microsoft accounts is incorrect.

Box 3 : No

A resource group in Azure is a logical container that organizes resources within a single subscription.

You cannot have resources from multiple subscriptions within the same resource group.

Question: 129 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

An Azure region

- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Answer:

Answer Area

An Azure region

- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Explanation:
A region is a set of data centres deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network.
Microsoft Azure currently has 55 regions worldwide.
Regions are divided into Availability Zones. Availability Zones are physically separate locations within an Azure region. Each Availability Zone is made up of one or more datacenters equipped with independent power, cooling, and networking.

Reference:
https://azure.microsoft.com/en-gb/global-infrastructure/regions/

Question: 130 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Answer Area

Statements	Yes	No
To use Azure Active Directory (Azure AD) credentials to sign in to a computer that runs Windows 10, the computer must be joined to Azure AD.	○	○
Users in Azure Active Directory (Azure AD) are organized by using resource groups.	○	○
Azure Active Directory (Azure AD) groups support dynamic membership rules.	○	○

Answer:

Answer Area

Statements	Yes	No
To use Azure Active Directory (Azure AD) credentials to sign in to a computer that runs Windows 10, the computer must be joined to Azure AD.	○	○
Users in Azure Active Directory (Azure AD) are organized by using resource groups.	○	○
Azure Active Directory (Azure AD) groups support dynamic membership rules.	○	○

Explanation:

Statement 1: To use Azure Active Directory (Azure AD) credentials to sign in to a computer that runs Windows 10, the computer must be joined to Azure AD.

Answer: Yes

Explanation: For a local client operating system (like Windows 10 or Windows 11) to natively trust, evaluate, and accept cloud-based identity credentials at the login screen, the device itself must establish a formal trust relationship with the identity directory. This is achieved by performing an Azure AD Join (or Hybrid Azure AD Join), which registers the hardware object into the tenant and allows users to log into the desktop using their corporate organizational cloud credentials.

Statement 2: Users in Azure Active Directory (Azure AD) are organized by using resource groups.

Answer: No

Explanation: This statement mixes up two completely separate Azure architectural boundaries:

Resource Groups are strictly logical deployment containers used to organize, manage, secure, and lifecycle physical infrastructure components (like virtual machines, virtual networks, and databases) within an Azure Subscription.

Azure AD (Microsoft Entra ID) identity objects are organized hierarchically using Administrative Units (AUs), security groups, or nested organizational configurations. Resource groups have no role in structuring directory users.

Statement 3: Azure Active Directory (Azure AD) groups support dynamic membership rules.

Answer: Yes

Explanation: Azure AD supports Dynamic Groups, which automate group membership management based on user attributes. Instead of manually adding or removing members, administrators write a conditional query rule (e.g., user.department -eq "Sales" or user.jobTitle -contains "Manager"). The identity system continuously evaluates user accounts against this expression and automatically provisions or de-provisions users from the group as their corporate profile details change.

Reference:

https://docs.microsoft.com/en-us/azure/active-directory/enterprise-users/groups-dynamic-membership
https://petri.com/understanding-hybrid-azure-active-directory-join

Question: 131 CertyIQ

You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines remain available if a single data center fails.
What are two possible solutions? Each correct answer presents a complete solution.

A. Deploy the virtual machines to two or more availability zones.
B. Deploy the virtual machines to two or more resource groups.
C. Deploy the virtual machines to a scale set.
D. Deploy the virtual machines to two or more regions.

Answer: AD

Explanation:

A. Deploy the virtual machines to two or more availability zones (Correct): An Azure Availability Zone is a unique physical location within an Azure region. Each zone is made up of one or more data centers equipped with independent power, cooling, and networking infrastructure. By distributing your VMs across multiple availability zones (e.g., Zone 1, Zone 2), if one data center or an entire zone goes down due to a power outage or infrastructure failure, your VMs running in the other zone(s) continue to remain available.

D. Deploy the virtual machines to two or more regions (Correct):

An Azure Region is a set of data centers deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network. By deploying virtual machines to separate regions (e.g., East US and West US), you are separating your infrastructure by hundreds of miles. If an entire region suffers a catastrophic data center failure, power grid failure, or natural disaster, the workloads running in the secondary region will keep your services available.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/overview https://docs.microsoft.com/en-us/azure/virtual-machines/windows/regions

Question: 132 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

be deployed to a separate virtual network.
run a different operating system than the other virtual machines.
be deployed to a separate resource group.
have two network interfaces.

Answer:

Answer Area

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

be deployed to a separate virtual network.
run a different operating system than the other virtual machines.
be deployed to a separate resource group.
have two network interfaces.

Explanation:
Azure automatically routes traffic between subnets in a virtual network. Therefore, all virtual machines in a virtual network can connect to the other virtual machines in the same virtual network. Even if the virtual machines are on separate subnets within the virtual network, they can still communicate with each other. To ensure that a virtual machine cannot connect to the other virtual machines, the virtual machine must be deployed to a separate virtual network.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-udr-overview

Question: 133 CertyIQ

DRAG DROP -
Match the Azure service to the appropriate description.
To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Services	Answer Area	
Azure Cosmos DB	Azure Synapse Analytics	A fully managed data warehouse that has integral security at every level of scale at no extra cost.
Azure HDInsight	Azure Cosmos DB	A globally distributed database that supports NoSQL.
Azure Synapse Analytics	Azure HDInsight	Managed Apache Hadoop clusters in the cloud that enable you to process massive amounts of data.

Answer:

Services	Answer Area	
	Azure Synapse Analytics	A fully managed data warehouse that has integral security at every level of scale at no extra cost.
	Azure Cosmos DB	A globally distributed database that supports NoSQL.
	Azure HDInsight	Managed Apache Hadoop clusters in the cloud that enable you to process massive amounts of data.

Explanation:

azure synapse analytics = Warehouse

Azure cosmos = even larger than the globe (global) : cosmos

Azure HDInsight = HaDoop

Azure synapse analytics used to be called Azure SQL Data Warehouse

https://azure.microsoft.com/en-us/blog/azure-sql-data-warehouse-is-now-azure-synapse-analytics/

Azure cosmos is the only database that supports NoSQL.

https://www.sqlshack.com/learn-nosql-in-azure-an-overview-of-azure-cosmos-db/

Azure HDInsight :

https://docs.microsoft.com/en-us/azure/hdinsight/hdinsight-hadoop-provision-linux-clusters

Question: 134

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The Archive access tier is set at the storage account level.	○	○
The Hot access tier is recommended for data that is accessed and modified frequently.	○	○
The Cool access tier is recommended for long term backups.	○	○

Answer:

Statement 1 (No): Default access tiers set at the storage account level can only be configured as Hot or Cool (and in newer accounts, Cold). The Archive tier cannot be set as the default access tier for an entire storage account; it is strictly an offline tier set at the individual blob level (or managed via Blob Lifecycle Management rules).

Statement 2 (Yes): The Hot access tier is optimized for data that is actively in use, frequently read, and frequently modified. It features the lowest access and transaction costs, balanced against higher storage capacity costs compared to cooler tiers.

Statement 3 (No): The Archive access tier is the recommended tier for long-term backups, secondary archival, and compliance records that are rarely accessed and can tolerate hours of retrieval latency. The Cool tier is intended for short-term backup or infrequently accessed data that is retained for at least 30 days, whereas long-term/permanent archival belongs in the Archive tier.

Answer Area

Statements	Yes	No
The Archive access tier is set at the storage account level.	○	●
The Hot access tier is recommended for data that is accessed and modified frequently.	●	○
The Cool access tier is recommended for long term backups.	○	●

Explanation:

Box 1: NO.

from Azure document: "Only the hot and cool access tiers can be set at the account level. The archive access tier can only be set at the blob level."

Please see: https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers

Box 2: Yes -

Usage scenarios for the hot access tier include:

- Data that is in active use or is expected to be read from and written to frequently
- Data that is staged for processing and eventual migration to the cool access tier

Box 3: No -

Usage scenarios for the cool access tier include:

- Short-term backup and disaster recovery
- Older data not used frequently but expected to be available immediately when accessed

Large data sets that need to be stored cost effectively, while more data is being gathered for future processing

Reference:

https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers

Question: 135 CertyIQ

What is the most severe failure from which an Azure Availability Zone can be used to protect access to Azure service?

A. a physical server failure
B. an Azure region failure
C. a storage failure
D. an Azure data center failure

Answer: D

Explanation:
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.
Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/availability

Question: 136 CertyIQ

You need to purchase a third-party virtual security appliance that you will deploy to an Azure subscription.
What should you use?

A. Azure subscriptions
B. Azure Security Center
C. Azure Marketplace
D. Microsoft Store

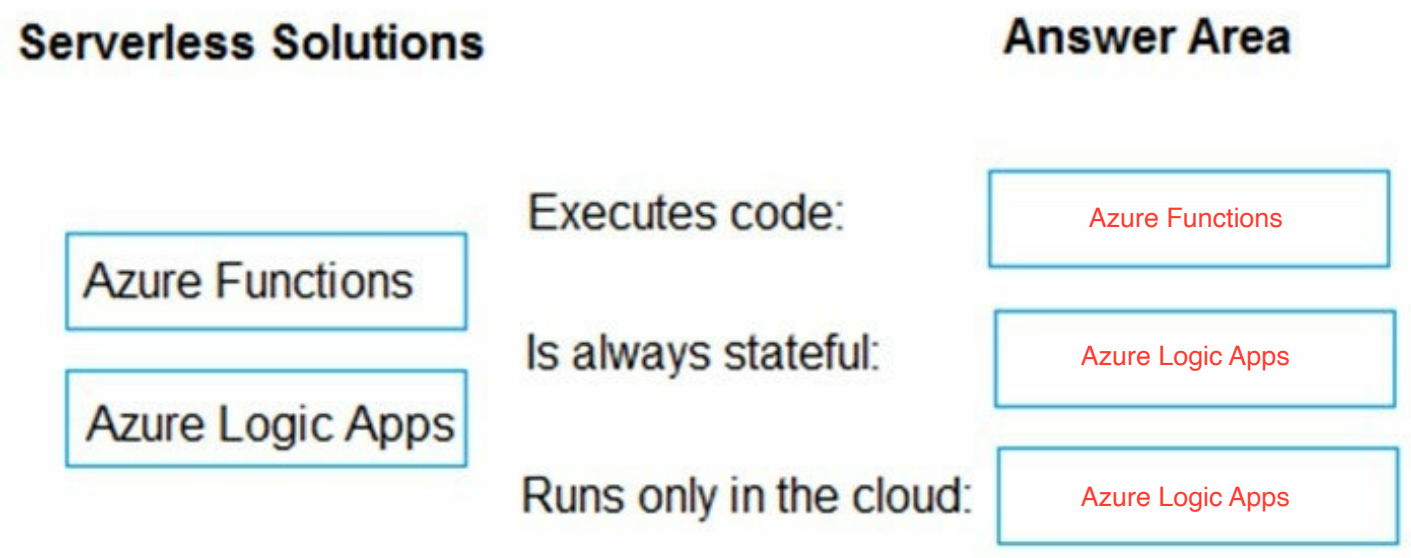
Answer: C

Explanation:

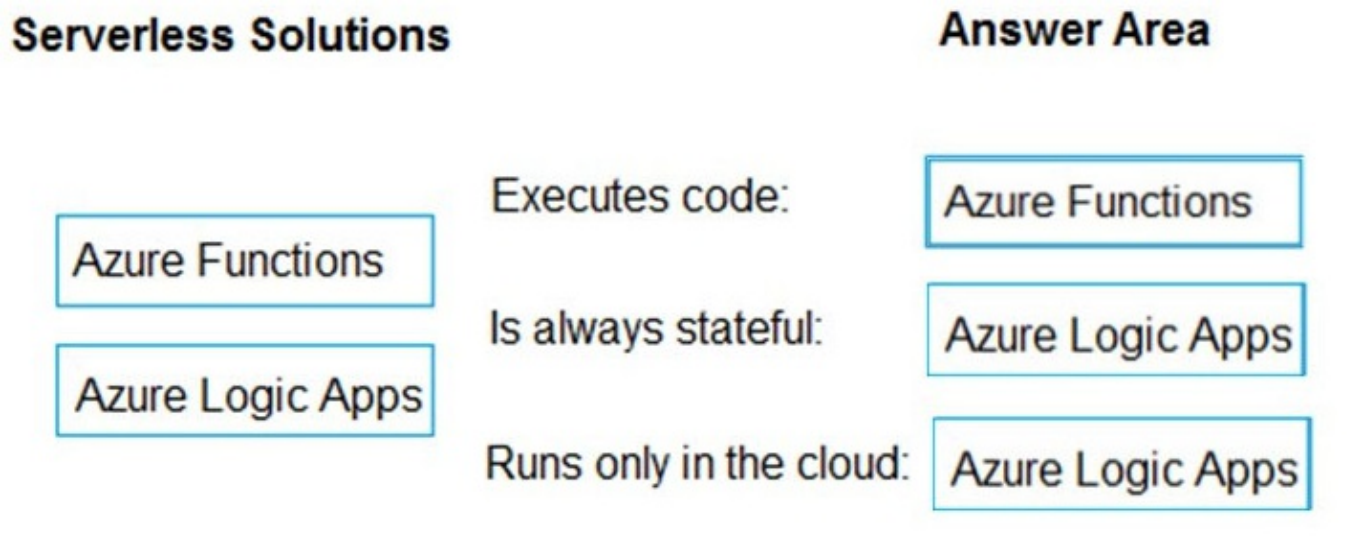
Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/ea-azure-marketplace

Question: 137 CertyIQ

DRAG DROP -
Match the serverless solution to the correct characteristic.
To answer, drag the appropriate serverless solution from the column on the left to its characteristic on the right.
Each serverless solution may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Box 1: Azure Functions .

Azure Functions allows you to implement your system's logic into readily available blocks of code called "functions". Different functions can run anytime you need to respond to critical events.

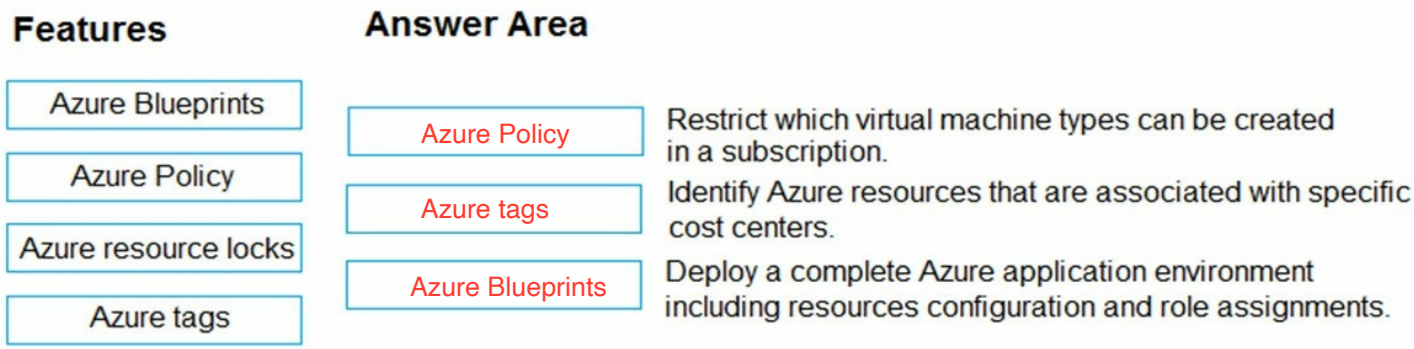
Box 2: Azure Logic Apps.

Box 3: Azure Logic Apps -

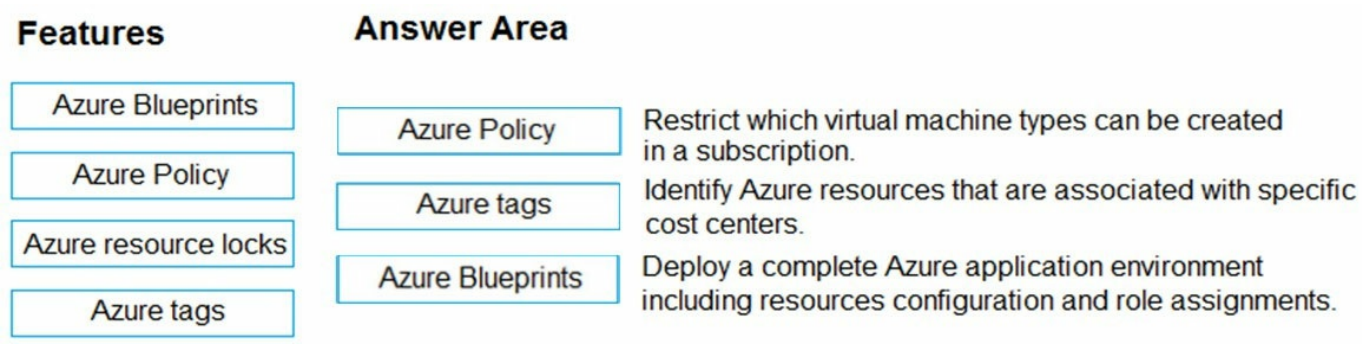
Azure Logic Apps is a cloud-based platform for creating and running automated workflows that integrate your apps, data, services, and systems.

Question: 138 CertyIQ

DRAG DROP -
Match the Azure governance feature to the correct description.
Instructions: To answer, drag the appropriate feature from the column on the left to its description on the right.
Each feature may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

1. Azure Policy $\rightarrow$ Restrict which virtual machine types can be created in a subscription.Explanation: Azure Policy is a governance tool used to create, assign, and manage policies that enforce rules over your corporate resources.Key Context: It dynamically evaluates your resource properties during a deployment against specified compliance rules. A classic, standard use case is assigning an internal policy that restricts or blocks the deployment of expensive or massive virtual machine stock keeping units (SKUs) (e.g., allowing only "D-series" VMs) to tightly control cost baselines within a specific development subscription.2. Azure tags $\rightarrow$ Identify Azure resources that are associated with specific cost centers.Explanation: Azure tags are simple metadata elements applied directly to your cloud resources consisting of a user-defined key-value pair (for example, Key: CostCenter and Value: Finance-01).Key Context: Tags allow you to categorize and organize your resources logically outside of the strict, structural subscription or resource group hierarchy. They are crucial for complex corporate cost allocation, chargeback mechanisms, and billing aggregation inside Microsoft Cost Management.3. Azure Blueprints $\rightarrow$ Deploy a complete Azure application environment including resources configuration and role assignments.Explanation: Azure Blueprints allows cloud architects to define a repeatable, orchestratable set of Azure artifacts that comply with an organization's standards, patterns, and requirements.Key Context: While infrastructure-as-code tools (like ARM templates) focus purely on deploying specific resources, a blueprint packages multiple foundational components together in a single package. It can orchestrate the simultaneous deployment of:Role Assignments (RBAC settings for teams)Policy Assignments (governance constraints)ARM Templates (the physical compute, network, or storage resources)Resource Groups (the foundational containers)

Reference:

https://docs.microsoft.com/en-us/azure/governance/blueprints/overview https://docs.microsoft.com/en-us/azure/governance/policy/overview https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources?tabs=json https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/lock-resources?tabs=json

Question: 139 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Availability Zone in Azure has physically separate locations

- across two continents
- within a single Azure region
- within multiple Azure regions
- within a single Azure datacenter

Answer:

Answer Area

An Availability Zone in Azure has physically separate locations

- across two continents
- within a single Azure region
- within multiple Azure regions
- within a single Azure datacenter

Explanation:

Box: within a single Azure region

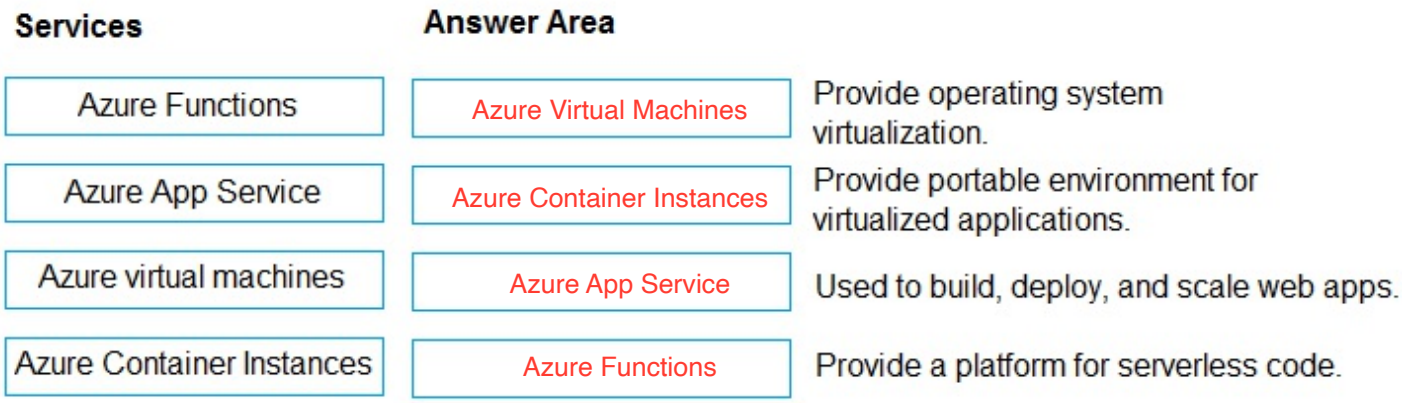
Azure availability zones are physically separate locations within each Azure region that are tolerant to local failures.

Reference:

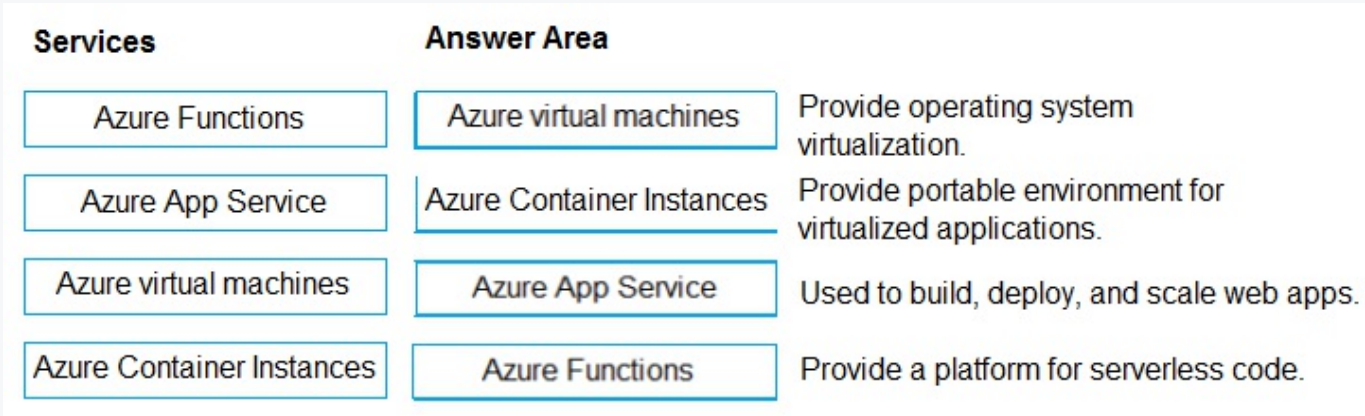
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 140 CertyIQ

DRAG DROP -
Match the Azure services to the correct descriptions.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:
Box 1: Azure virtual machines -
Box 2: Azure Container instances
Azure Container Instances (ACI) is a managed service that allows you to run containers directly on the Microsoft Azure public cloud, without requiring the use of virtual machines (VMs).
Develop apps fast without managing virtual machines or having to learn new tools"it's just your application, in a container, running in the cloud.

Box 3: Azure App Service -
Azure App Service is a fully managed platform for building web applications.
Applications run and scale with ease on both Windows and Linux-based environments.

Box 4: Azure Functions -
Azure Functions (from Microsoft Azure) is a cloud-based serverless service that allows running event-triggered code in a scalable way without providing or managing infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/container-instances
https://azure.microsoft.com/en-us/services/app-service/

https://revdebug.com/blog/what-are-azure-functions

Question: 141 CertyIQ

HOTSPOT -
To answer, select the appropriate option in the answer area.
Hot Area:

Answer Area

You have several virtual machines in an Azure subscription. You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2019.

Answer:

Answer Area

You have several virtual machines in an Azure subscription. You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2019.

Explanation:
Box: The virtual machines can be moved to the new subscription.
You can move a VM and its associated resources to a different subscription by using the Azure portal.
Note: Repeat the process below for each Resource Group containing the VMs.
1. Go to the Azure portal to manage the resource group containing the VM to move. Search for and select Resource groups.
2. Choose the resource group containing the VM that you would like to move.
3. At the top of the page for the resource group, select Move and then select Move to another subscription. The Move resources page opens.
4. Select each of the resources to move. In most cases, you should move all of the related resources that are listed.
5. Select the Subscription where you want the VM to be moved.
6. Select an existing Resource group, or enter a name to have a new resource group created.
7. When you are done, select that you understand that new resource IDs will be created and that the new IDs will need to be used with the VM after it is moved, and then select OK.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/move-vm

Question: 142 CertyIQ

You need to purchase a third-party virtual security appliance that you will deploy to an Azure subscription. What should you use?

A. Azure subscriptions
B. Microsoft Defender for Cloud
C. Azure Marketplace
D. Microsoft Store

Answer: C

Explanation:
You can access these enhanced network security features by using an Azure partner solution. You can find the most current Azure partner network security solutions by visiting the Azure Marketplace, and searching for "security" and "network security."
Some third-party reseller services available on Azure Marketplace now consume your Enterprise Agreement (EA) Azure Prepayment balance.

Reference:
https://docs.microsoft.com/en-us/azure/security/fundamentals/network-overview
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/ea-azure-marketplace

Question: 143 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure Sphere is an end-to-end security solution designed specifically for connected Internet of Things (IoT) devices. It is uniquely composed of three tightly coupled components:

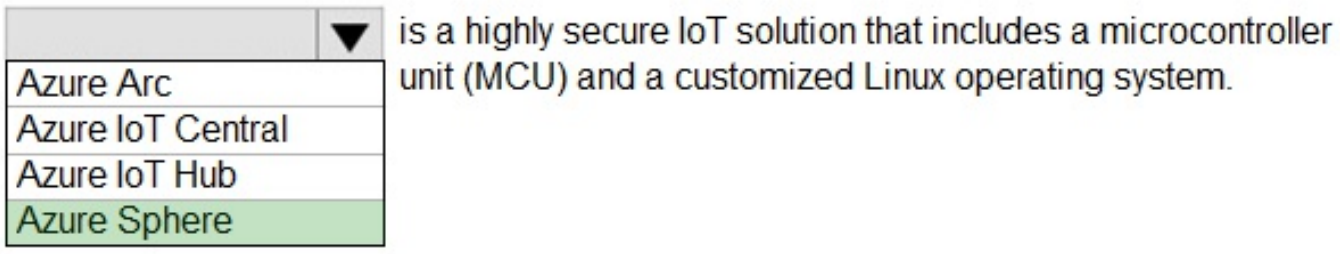
Secured silicon: Certified, cross-over microcontroller units (MCUs) with built-in Microsoft Pluton security subsystems.

Answer:

Secured operating system: A purpose-built, highly tuned custom Linux-based OS (Azure Sphere OS) with layered defense-in-depth architecture.

Answer Area

Cloud security service: The Azure Sphere Security Service (AS3), which brokers trust, validates device integrity via certificate authentication, and delivers automated, secure OS/application updates for over a decade.



Explanation:

Microsoft's Azure Sphere hardware and service designed to better secure Internet of Things (IoT) devices. Azure Sphere consists of Microsoft-certified microcontrollers " single-chip computers with processors, storage, memory and IoT capabilities " plus the Azure
Sphere Linux-based OS and the Azure Sphere cloud security service.

Reference:
https://www.zdnet.com/article/microsofts-azure-sphere-its-linux-based-microcontroller-plus-cloud-service-hits-general-availability/

Question: 144 CertyIQ

You plan to deploy a service to Azure virtual machines.
You need to ensure that the service will be available if a datacenter fails.
What should you use as part of the virtual machine deployment?

A. availability sets
B. proximity placement groups
C. host groups
D. availability zones

Answer: D

Explanation:
Azure availability zones are physically separate locations within each Azure region that are tolerant to local failures. Failures can range from software and hardware failures to events such as earthquakes, floods, and fires. Tolerance to failures is achieved because of redundancy and logical isolation of Azure services. To ensure resiliency, a minimum of three separate availability zones are present in all availability zone-enabled regions.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 145 CertyIQ

Your company has an Azure subscription that contains resources in several regions.
You need to ensure that administrators can only create resources in those regions.
What should you use?

A. a read-only lock
B. an Azure policy
C. a management group
D. a reservation

Answer:

B

Explanation:

Policy is correct.

reference:

https://learn.microsoft.com/en-us/azure/governance/management-groups/overview

"For example, you can apply policies to a management group that limits the regions available for virtual machine (VM) creation. This policy would be applied to all nested management groups, subscriptions, and resources, and allow VM creation only in authorized regions.

Question: 146 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Azure region
- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Answer:

Answer Area

An Azure region
- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Explanation:
Box: contains one or more data centers that are connected by using a low-latency network.
Each Azure region features datacenters deployed within a latency-defined perimeter. They're connected through a dedicated regional low-latency network. This design ensures that Azure services within any region offer the best possible performance and security.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 147 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can use the Azure File Sync agent to sync on-premises data to an Azure

- blob container.
- Data Lake Storage container.
- file share.
- queue.

Azure File Sync allows organizations to centralize file shares in Azure Files (an Azure file share) while preserving the local compatibility, access latency, and caching benefits of an on-premises Windows Server.

The Azure File Sync agent is installed directly on an on-premises Windows Server to establish a sync relationship between a local folder (Server Endpoint) and an Azure file share (Cloud Endpoint).

Answer:

It also provides cloud tiering, automatically keeping frequently accessed files cached locally while tiering infrequently accessed files to the Azure file share in the cloud.

Answer Area

You can use the Azure File Sync agent to sync on-premises data to an Azure

- blob container.
- Data Lake Storage container.
- file share.
- queue.

Explanation:

The Azure File Sync agent enables data on a Windows Server to be synchronized with an Azure File share.

Reference:

https://www.microsoft.com/en-us/download/details.aspx?id=57159

Question: 148

CertyIQ

What is the function of a Site-to-Site VPN?

A. provides a secure connection between a computer on a public network and the corporate network

B. provides a dedicated private connection to Azure that does NOT travel over the internet

C. provides a connection from an on-premises VPN device to an Azure VPN gateway

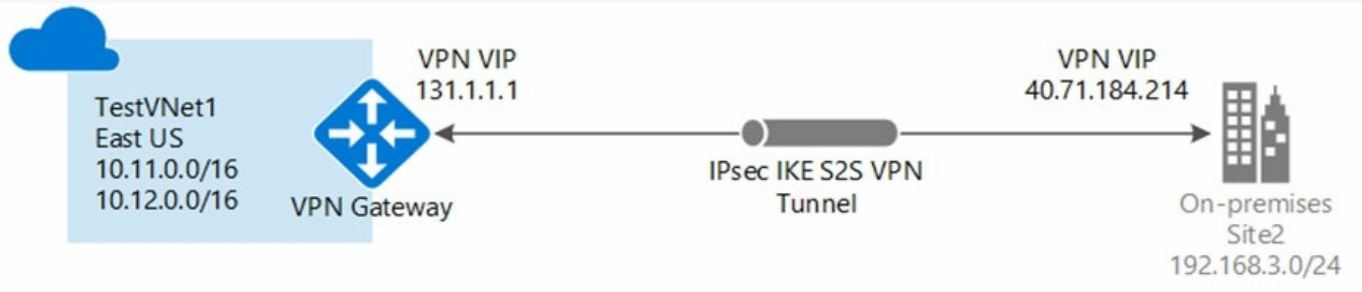
Answer: C

Explanation:

A Site-to-Site VPN gateway connection is used to connect your on-premises network to an Azure virtual network over an IPsec/IKE (IKEv1 or IKEv2) VPN tunnel.

This type of connection requires a VPN device located on-premises that has an externally facing public IP address assigned to it.

Example:

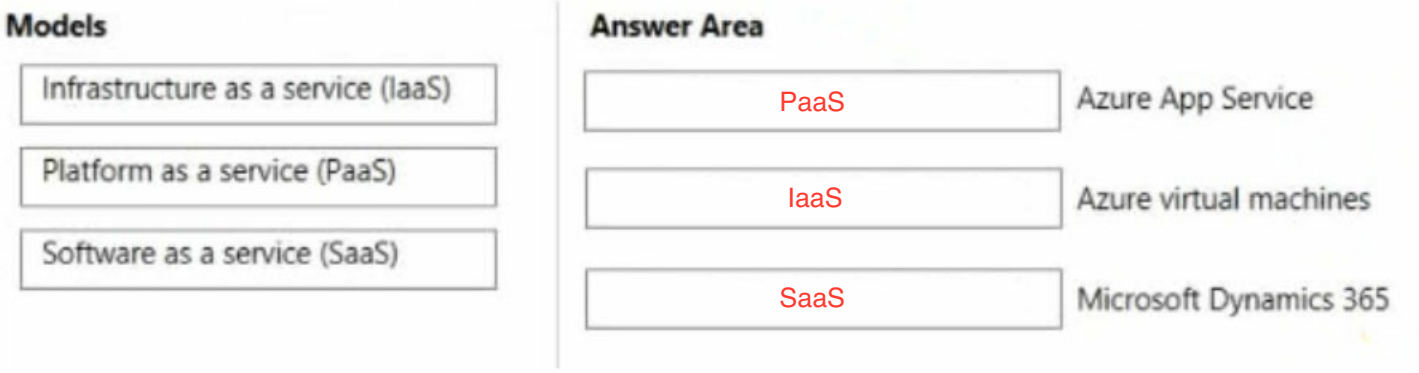


Reference:

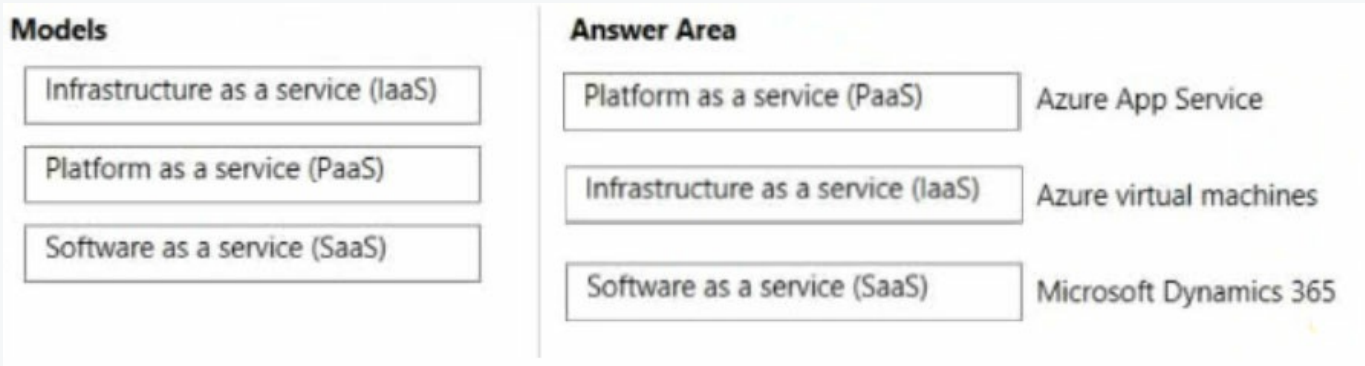
https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-howto-site-to-site-classic-portal

Question: 149 CertyIQ

DRAG DROP -
Match the cloud service models to the appropriate offerings.
To answer, drag the appropriate model from the column on the left to its offering on the right. Each model may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



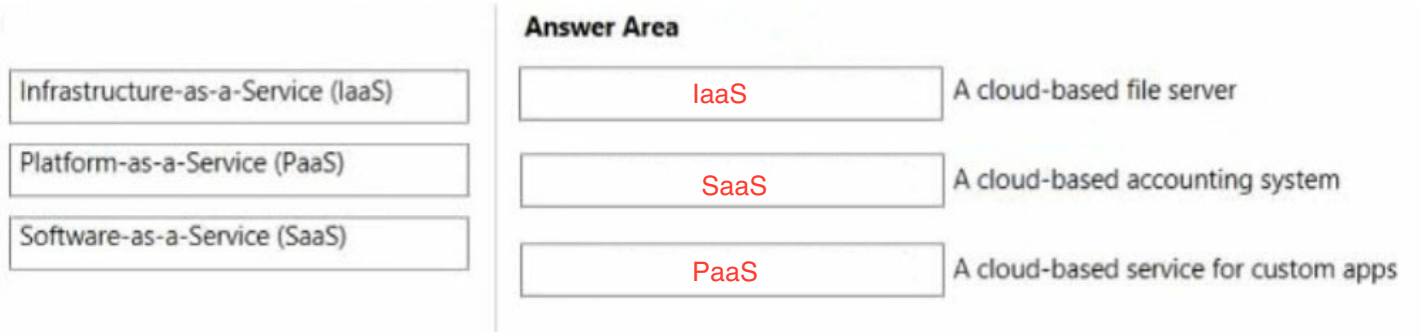
Explanation:
Box 1: Platform as a service (PaaS)
Azure App Service is a fully managed platform for building web applications.
Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications.
Box 2: Infrastructure as a service (IaaS)
Windows Azure Virtual Machines, an Infrastructure-as-a-Service (IaaS) offering in Windows Azure, was released back in 2012.
Box 3: Software as a service (SaaS)
Dynamics 365 is a set of interconnected, modular Software-as-a-Service (SaaS) applications and services designed to both transform and enable your core customers, employees, and business activities.

Reference:
https://azure.microsoft.com/en-us/overview/what-is-paas/
https://azure.microsoft.com/en-us/blog/infrastructure-as-a-service-series-virtual-machines-and-windows/
https://pipol.com/what-is-microsoft-dynamics-365

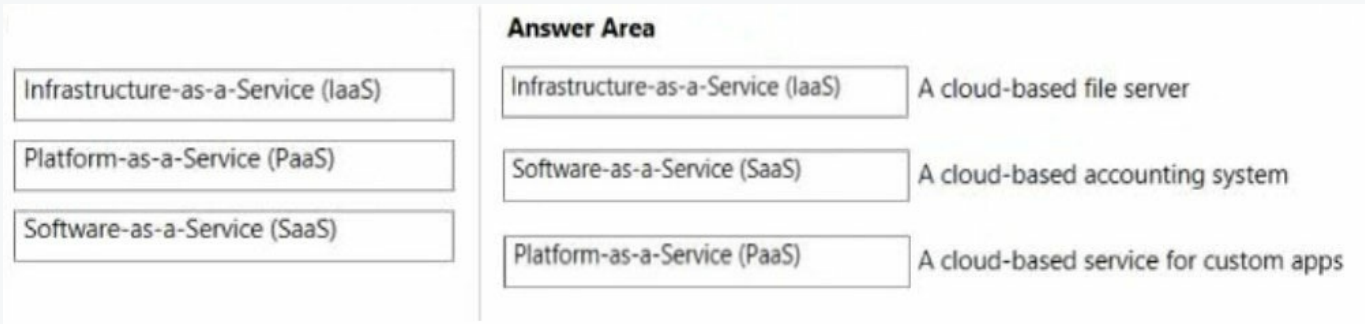
Question: 150 CertyIQ

DRAG DROP -

Match the cloud service models to the appropriate solutions.
To answer, drag the appropriate cloud service model from the column on the left to its solution on the right Each cloud service model may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:
Box 1: Infrastructure as a service (IaaS)
Azure Files is a simple, secure, and serverless enterprise-grade cloud file shares.
Infrastructure as a service (IaaS) is a type of cloud computing service that offers essential compute, storage, and networking resources on demand, on a pay-as- you-go basis.
Box 2: Software as a service (SaaS)
Dynamics 365 is a set of interconnected, modular Software-as-a-Service (SaaS) applications and services designed to both transform and enable your core customers, employees, and business activities. It includes Dynamics 365 Finance: use the guided, rules-based chart of accounts and no-code configuration service to simplify regulatory reporting, electronic invoicing, and global payments.
Box 3: Platform as a service (PaaS)
Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications.

Reference:
https://azure.microsoft.com/en-us/overview/what-is-iaas
https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 151 CertyIQ

You need to manage containers.
Which two services can you use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Azure Virtual Desktop
B. Azure virtual machines
C. Azure Functions
D. Azure Container Instances

E. Azure Kubernetes Service (AKS)

Answer: DE

Explanation:
Run Docker containers on-demand in a managed, serverless Azure environment. Azure Container Instances is a solution for any scenario that can operate in isolated containers, without orchestration. Run event-driven applications, quickly deploy from your container development pipelines, and run data processing and build jobs.
You can manage containers at scale with a fully managed Kubernetes container management and orchestration service that integrates with Azure Active
Directory.
Azure Kubernetes Service is a robust and cost-effective container orchestration service that helps you to deploy and manage containerized applications in seconds where additional resources are assigned automatically without the headache of managing additional servers.

Reference:
https://docs.microsoft.com/en-us/azure/container-instances/
https://cloudacademy.com/blog/azure-kubernetes-service-aks-what-is-it-and-why-do-we-use-it

Question: 152 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines [ ]

- to the same Azure region.
- by using the same Azure Resource Manager template.
- to the same resource group.
- to the same availability zone.

Answer:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines [ ]

- to the same Azure region.
- by using the same Azure Resource Manager template.
- to the same resource group.
- to the same availability zone.

Explanation:
A resource group is a logical container for Azure resources. Resource groups make the management of Azure resources easier.
With a resource group, you can allow a user to manage all resources in the resource group, such as virtual machines, websites, and subnets. The permissions you apply to the resource group apply to all resources

contained in the resource group.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups
https://docs.microsoft.com/en-us/azure/role-based-access-control/overview

Question: 153 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more availability zones.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.
Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/availability

Question: 154 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
One of the benefits of Azure SQL Data Warehouse is that high availability is built into the platform.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. automatic scaling
C. data compression
D. versioning

As a fully managed Platform as a Service (PaaS) offering, Azure SQL Data Warehouse (Azure Synapse Analytics dedicated SQL pool) includes built-in high availability by default without requiring user configuration or extra infrastructure deployment.

The underlying Massively Parallel Processing (MPP) architecture separates compute from storage:
The storage layer is backed by transparent, highly available Azure Storage (LRS/geo-redundant with at least 3 automatic replicas).
The compute tier (Control and Compute nodes) is continuously monitored by the Azure service fabric and platform health agents; if a compute node fails, it is automatically recycled and replaced without manual administrator intervention.

Answer: A

Explanation:
Azure Data Warehouse (now known as Azure Synapse Analytics) is a PaaS offering from Microsoft. As with all PaaS services from Microsoft, SQL Data
Warehouse offers an availability SLA of 99.9%. Microsoft can offer 99.9% availability because it has high

availability features built into the platform.

Reference:
https://docs.microsoft.com/en-us/azure/sql-data-warehouse/sql-data-warehouse-overview-faq

Question: 155 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more regions.
Does this meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

By deploying the virtual machines to two or more regions, you are deploying the virtual machines to multiple datacenters. This will ensure that the services running on the virtual machines are available if a single data center fails.

Azure operates in multiple datacenters around the world. These datacenters are grouped in to geographic regions, giving you flexibility in choosing where to build your applications.

You create Azure resources in defined geographic regions like 'West US', 'North Europe', or 'Southeast Asia'. You can review the list of regions and their locations.

Within each region, multiple datacenters exist to provide for redundancy and availability.

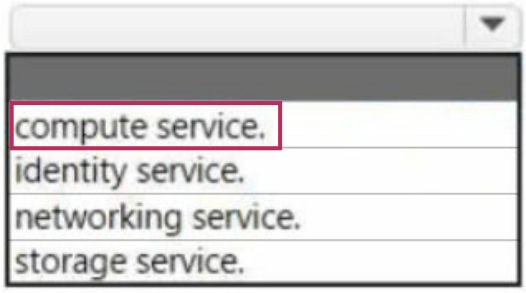
Reference:

https://docs.microsoft.com/en-us/azure/virtual-machines/windows/regions

Question: 156 CertyIQ

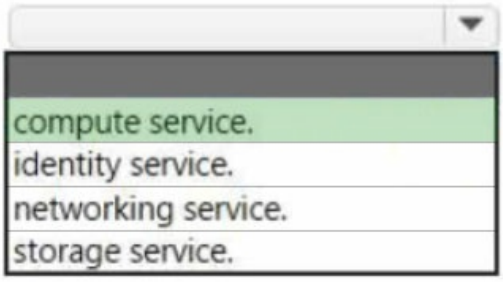
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

An Azure container instance is an example of an Azure



Answer:

An Azure container instance is an example of an Azure



Explanation:

The term compute refers to the hosting model for the computing resources that your application runs on. For Azure this include:

Azure Container Instances. The fastest and simplest way to run a container in Azure, without having to provision any virtual machines and without having to adopt a higher-level service.

Note, and also the following:

Azure App Service. A managed service for hosting web apps, mobile app back ends, RESTful APIs, or automated business processes.

Azure Spring Cloud. A managed service designed and optimized for hosting Spring Boot apps.

Azure Kubernetes Service (AKS). A managed Kubernetes service for running containerized applications.

Azure Batch. A managed service for running large-scale parallel and high-performance computing (HPC) applications

Azure Functions. A managed FaaS service.

Azure Service Fabric. A distributed systems platform that can run in many environments, including Azure or on premises.

Azure Virtual machines. Deploy and manage VMs inside an Azure virtual network.

Azure Container Apps. Deploy and manage VMs inside an Azure virtual network.

Reference:

https://docs.microsoft.com/en-us/azure/architecture/guide/technology-choices/compute-decision-tree

Question: 157

CertyIQ

At which OSI layer does ExpressRoute operate?

A. Layer 2
B. Layer 3
C. Layer 5
D. Layer 7

Azure ExpressRoute allows organizations to extend their on-premises networks into the Microsoft cloud over a private connection facilitated by a connectivity provider.

ExpressRoute relies on Layer 3 (Network layer) IP routing using industry-standard dynamic routing protocols (eBGP — External Border Gateway Protocol) to exchange routes between customer on-premises routers, provider edge devices, and Microsoft Enterprise Edge (MSEE) routers.

In Microsoft's official networking documentation and fundamental exam taxonomies, ExpressRoute is classified as providing dedicated, private Layer 3 connectivity.

Answer: B

Explanation:

Layer 3

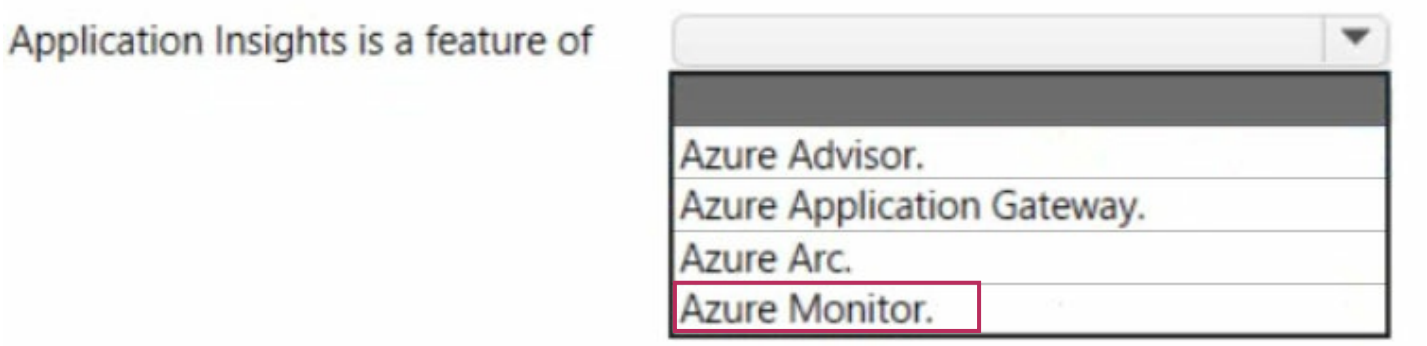
https://learn.microsoft.com/en-us/azure/expressroute/expressroute-introduction#key-benefits

Layer 3 connectivity between your on-premises network and the Microsoft Cloud through a connectivity provider. Connectivity can be from an any-to-any (IPVPN) network, a point-to-point Ethernet connection, or through a virtual cross-connection via an Ethernet exchange.

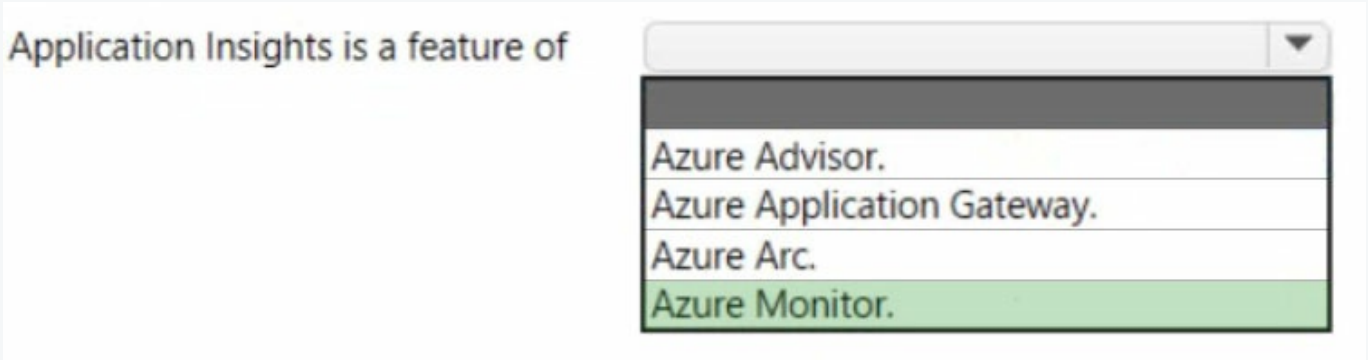
Question: 158

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:
Application Insights is a feature of Azure Monitor that provides extensible application performance management (APM) and monitoring for live web apps.

Reference:
https://docs.microsoft.com/en-us/azure/azure-monitor/app/app-insights-overview
