About CertyIQ

We here at CertyIQ eventually got enough of the industry's greedy exam paid for. Our team of IT professionals comes with years of experience in the IT industry Prior to training CertIQ we worked in test areas where we observed the horrors of the paywall exam preparation system.

The misuse of the preparation system has left our team disillusioned. And for that reason, we decided it was time to make a difference. We had to make In this way, CertyIQ was created to provide quality materials without stealing from everyday people who are trying to make a living.

Doubt Support

We have developed a very scalable solution using which we are able to solve 400+ doubts every single day with an average rating of 4.8 out of 5.

★★★★★

Thanks you so much for your help. I scored 972 in my exam today. More than 90% were from your PDFs!

Dana

September 04, 2022

★★★★★

Thanks a lot for this updated AZ-900 Q&A. I just passed my exam and got 974, I followed both of your Az-900 videos and the 6 PDF, the PDFs are very much valid, all answers are correct. Could you please create a similar video/PDF for DP900, your content/PDF's is really awesome. The team did a really good job. Thank You 😊.

Ahamed Shibly

★★★★★

Customer support is realy fast and helpful, I just finished my exam and this video along with the 6 PDF helped me pass! Definitely recommend getting the PDFs. Thank you!

October 22, 2022

★★★★★

Passed my exam today with 891 marks. Out of 52 questions, 51 were from certyiq PDFs including Contoso case study.
Thank You certyiq team!

Henry Rome

★★★★★

These questions are real and 100 % valid. Thank you so much for your efforts, also your 4 PDFs are awesome, I passed the DP900 exam on 1 Sept. With 968 marks. Thanks a lot, buddy!

Esmaria

2 months ago

★★★★★

Simple easy to understand explanations. To anyone out there wanting to write AZ900, I highly recommend 6 PDF's.Thank you so much, appreciate all your hard work in having such great content. Passed my exam Today - 3 September with 942 score.

Microsoft

(AZ-900)

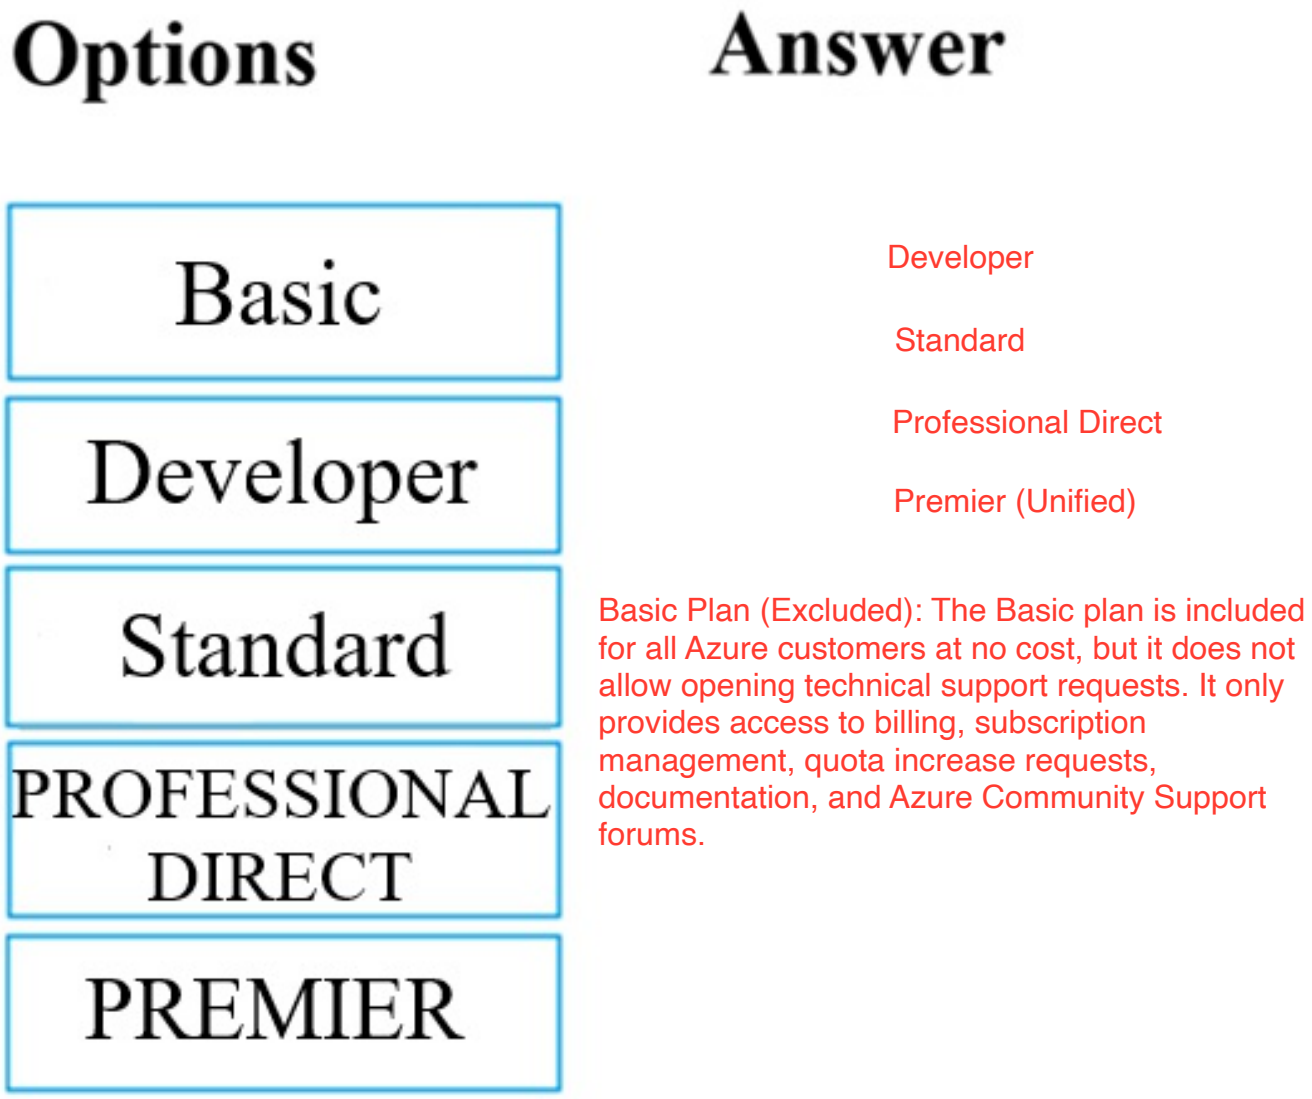
Microsoft Azure Fundamentals

Total: **474 Questions**

Link: https://certyiq.com/papers/microsoft/az-900

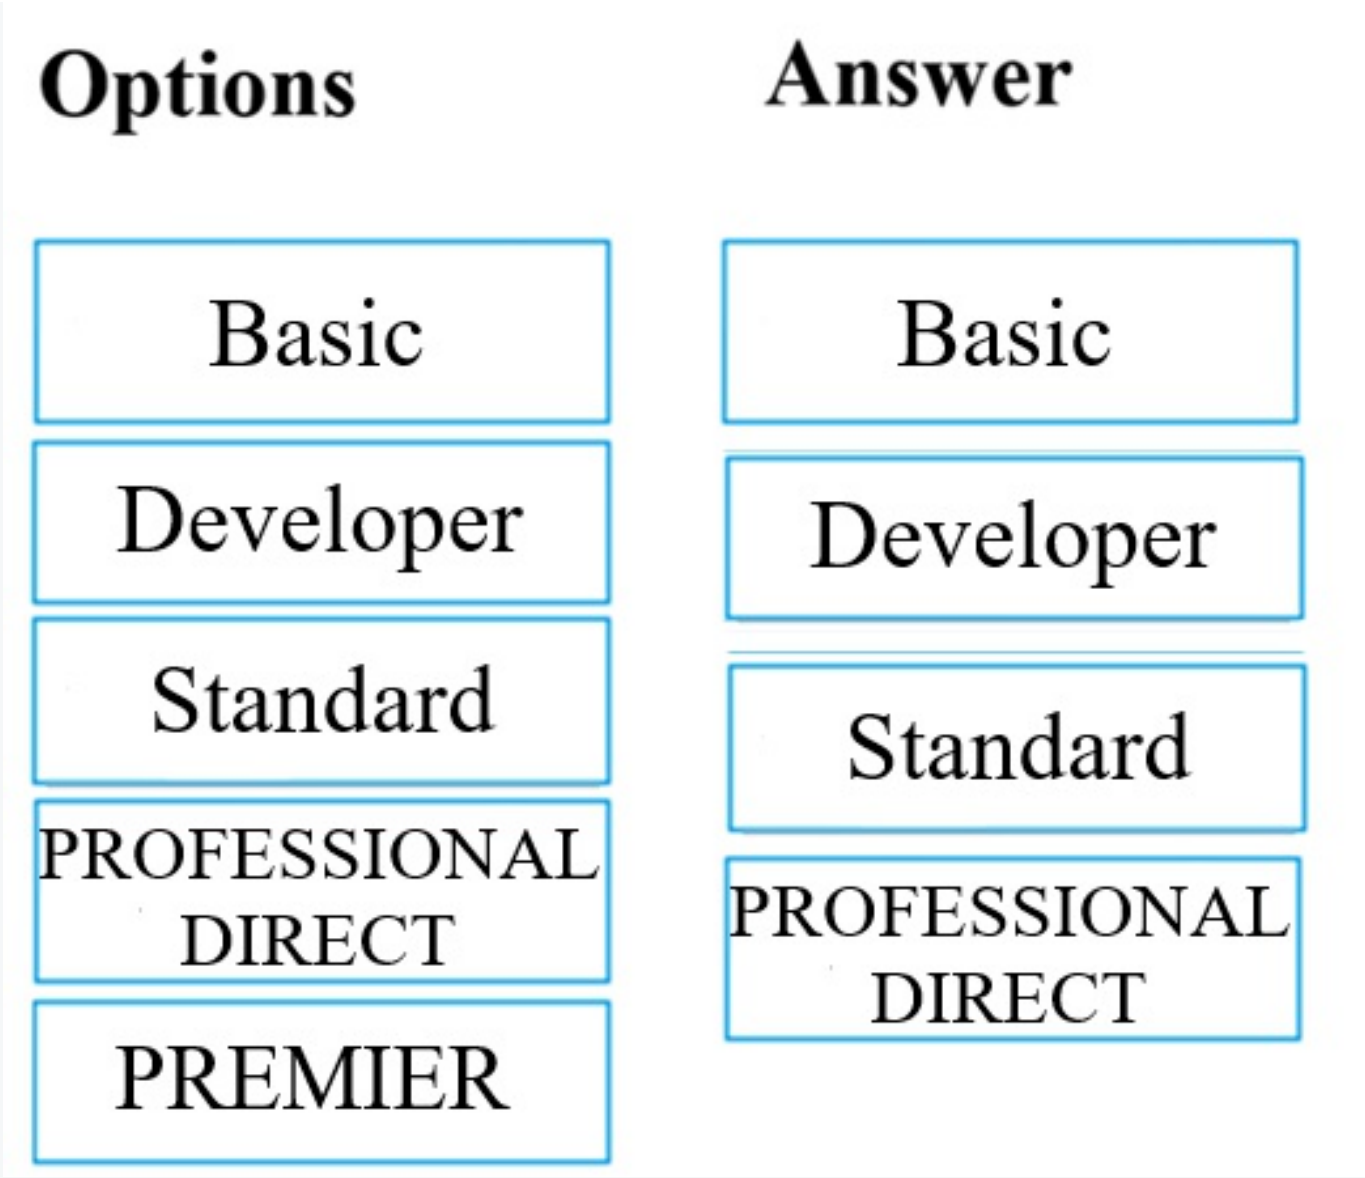
Question: 1 CertyIQ

DRAG DROP -
Your company intends to subscribe to an Azure support plan.
The support plan must allow for new support requests to be opened.
Which of the following are support plans that will allow this? Answer by dragging the correct option from the list to the answer area.
Select and Place:



Basic Plan (Excluded): The Basic plan is included for all Azure customers at no cost, but it does not allow opening technical support requests. It only provides access to billing, subscription management, quota increase requests, documentation, and Azure Community Support forums.

Answer:



Explanation:

Basic: This is listed twice, suggesting it might be a basic tier or level of service.

Developer: Also listed twice, possibly indicating a tier tailored for developers.

Standard: Listed twice, likely representing a standard level of service or features.

PROFESSIONAL DIRECT: Listed twice, possibly indicating a higher tier with more advanced features.

Listed twice, which might refer to a direct service or access level.

Question: 2 CertyIQ

Your company has datacenters in Los Angeles and New York. The company has a Microsoft Azure subscription.
You are configuring the two datacenters as geo-clustered sites for site resiliency.
You need to recommend an Azure storage redundancy option.
You have the following data storage requirements:
- Data must be stored on multiple nodes.
- Data must be stored on nodes in separate geographic locations.
- Data can be read from the secondary location as well as from the primary location

Which of the following Azure stored redundancy options should you recommend?

A. Geo-redundant storage

B. Read-only geo-redundant storage

C. Zone-redundant storage

D. Locally redundant storage

RA-GRS (Read-access geo-redundant storage) provides the exact same geographic replication as GRS, but additionally exposes a secondary read-only endpoint

Answer: B

Explanation:

GRS (Geo-redundant storage) replicates data synchronously three times within a single physical location in the primary region using LRS, then replicates asynchronously to a single physical location in the secondary paired region (providing six total copies across two regions). However, with standard GRS, data in the secondary region is not accessible for read operations unless Microsoft initiates a failover or customer-managed failover is triggered.

RA-GRS allows you to have higher read availability for your storage account by providing read only access to the data replicated to the secondary location. Once you enable this feature, the secondary location may be used to achieve higher availability in the event the data is not available in the primary region. This is an

opt-in feature which requires the storage account be geo-replicated.

References:

https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy-grs#read-access-geo-redundant-storage

Question: 3 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's Azure subscription includes a Basic support plan.
They would like to request an assessment of an Azure environment's design from Microsoft. This is, however, not supported by the existing plan.
You want to make sure that the company subscribes to a support plan that allows this functionality, while keeping expenses to a minimum.
Solution: You recommend that the company subscribes to the Professional Direct support plan.
Does the solution meet the goal?

A. Yes

B. No

Professional Direct (ProDirect): Adds access to Architectural Guidance delivered by Azure specialist teams (e.g., design assessments, best practices reviews based on the Azure Well-Architected Framework), pooled delivery managers, and operational support.

Enterprise (Unified / Premier): Offers full end-to-end designated Technical Account Managers and custom architectural assessments, but at an enterprise-scale cost.

Answer: B

Explanation:

B. No.

The Standard support plan would be the more cost-effective option compared to the Professional Direct plan for this specific requirement. The Standard plan includes support for design assessments and is generally less expensive than the Professional Direct plan.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Question: 4 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying Azure virtual machines for your company.
You need to make use of the appropriate cloud deployment solution.

Solution: You should make use of Software as a Service (SaaS).
Does the solution meet the goal?

A. Yes
B. No

Answer: B

Explanation:

Key word (Virtual Machine), then we should go with IaaS

Question: 5 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying Azure virtual machines for your company.
You need to make use of the appropriate cloud deployment solution.
Solution: You should make use of Platform as a Service (PaaS).
Does the solution meet the goal?

A. Yes
B. No

Answer: B

Explanation:

B. No - VMs are deployed in IaaS.

Refer: https://docs.microsoft.com/en-us/learn/modules/fundamental-azure-concepts/categories-of-cloud-services

Text to refer under IaaS : "Azure virtual machines are fully operational virtual compute devices running in Microsoft datacenters."

Question: 6 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying Azure virtual machines for your company.
You need to make use of the appropriate cloud deployment solution.
Solution: You should make use of Infrastructure as a Service (IaaS).
Does the solution meet the goal?

A. Yes
B. No

Answer: A

Explanation:

Virtual Machines and Azure storage accounts is IaaS

Question: 7 CertyIQ

Your developers have created 10 web applications that must be host on Azure.
You need to determine which Azure web tier plan to host the web apps. The web tier plan must meet the following requirements:
- The web apps will use custom domains.
- The web apps each require 10 GB of storage.
- The web apps must each run in dedicated compute instances.
- Load balancing between instances must be included.
- Costs must be minimized.

Which web tier plan should you use?

A. Standard
B. Basic
C. Free
D. Shared

Basic Tier: Runs on dedicated Azure VMs and supports custom domains, but it does not support auto-scale or traffic routing/load balancing between instances, and offers a maximum of only 10 GB total storage per plan (which cannot satisfy 10 web apps needing 10 GB each).

Standard Tier: Runs on dedicated compute instances, supports up to 50 GB (historically) or 250 GB total storage across apps, supports custom domains and SSL, and natively includes scale-out capabilities (up to 10 instances) with integrated Azure load balancing between instances.

Answer: A

Explanation:

Please read the requirements: Please note here the load balancing fact:

The web apps will use custom domains. (Basic, Shared and standard Support custom domain)
The web apps each require 10 GB of storage. (basic and standard support this)
The web apps must each run in dedicated compute instances.(basic support 3 instance max where standard support 10max)
Load balancing between instances must be included. (free, shared and basic dont support load balancing. standard and above tier only support load balancing/autoscaling)
Costs must be minimized. Standard is less costlier than premium and isolated.

I hope this is clear to chose the correct answer as STANDARD.

https://azure.microsoft.com/en-us/pricing/details/app-service/windows/

Question: 8 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are planning to migrate a company to Azure. Each of the company's numerous divisions will have an administrator in place to manage the Azure resources used by their respective division.
You want to make sure that the Azure deployment you employ allows for Azure to be segmented for the divisions, while keeping administrative effort to a minimum.
Solution: You plan to make use of several Azure Active Directory (Azure AD) directories.
Does the solution meet the goal?

A. Yes
B. No

To segment access and delegate administrative permissions across divisions with minimal administrative effort, Microsoft recommends using Azure Role-Based Access Control (Azure RBAC) scoped at the Subscription or Resource Group level (or organized under Management Groups), all trusted by a single Entra tenant.

Answer: B

Explanation:

The proposed solution is: You plan to make use of several Azure Active Directory (Azure AD) directories.

I think the key word is SEVERAL. Why in the world a company will create SEVERAL AADs when it can create a single AAD and organize its divisions right there?

This is why I consider the correct answer B (No).

Question: 9 CertyIQ

Your developers have created a portal web app for users in the Miami branch office. The web app will be publicly accessible and used by the Miami users to retrieve customer and product information. The web app is currently running in an on-premises test environment.
You plan to host the web app on Azure.
You need to determine which Azure web tier plan to host the web app. The web tier plan must meet the following requirements:
- The website will use the miami.weyland.com URL.
- The website will be deployed to two instances.
- SSL support must be included.
- The website requires 12 GB of storage.
- Costs must be minimized.

Which web tier plan should you use?

A. Standard
B. Basic
C. Free
D. Shared

Answer: A

Explanation:

keyword 12 GB

Free = 1 GB

Shared = 1 GB

Basic = 10 GB

Standard = 50 GB

Premium = 250 GB

Isolated = 1 TB

https://azure.microsoft.com/en-us/pricing/details/app-service/windows/

References:

http://azure.microsoft.com/en-us/documentation/articles/azure-subscription-service-limits/

Question: 10 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company is planning to migrate all their virtual machines to an Azure pay-as-you-go subscription. The virtual machines are currently hosted on the Hyper-V hosts in a data center.
You are required make sure that the intended Azure solution uses the correct expenditure model.
Solution: You should recommend the use of the elastic expenditure model.
Does the solution meet the goal?

A. Yes
B. No

Capital Expenditure (CapEx): The upfront spending of money on physical infrastructure (e.g., buying physical servers, storage arrays, network switches, data center facilities) and deducting that expense on your tax bill over time. The company's on-premises Hyper-V deployment is a typical CapEx model.

Operational Expenditure (OpEx): Spending money on services or products now and being billed for them continuously as they are consumed (pay-as-you-go, subscription pricing, recurring monthly/annual billing) with no upfront hardware purchase.

An Azure pay-as-you-go subscription operates strictly on the Operational Expenditure (OpEx) model.

Answer: B

Explanation:

Elasticity is not an expenditure model rather is one of the characteristics of could computing.

https://azure.microsoft.com/en-us/overview/what-is-elastic-computing/

The basic advantage of cloud computing is shifting your high Capital Expenditure (CAPEX) requirements to optimal Pay -As-You-Go model which is Operational Expenditure (OPEX)

https://azure.microsoft.com/en-us/pricing/purchase-options/pay-as-you-go/

Question: 11 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company is planning to migrate all their virtual machines to an Azure pay-as-you-go subscription. The virtual machines are currently hosted on the Hyper-V hosts in a data center.
You are required make sure that the intended Azure solution uses the correct expenditure model.
Solution: You should recommend the use of the scalable expenditure model.
Does the solution meet the goal?

A. Yes
B. No

Answer: B

Explanation:

Answer is NO. Because we have two expenditure models. One is Cap-Ex, another is Op-Ex. So Scalable Expenditure is not the right answer.

Question: 12 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company is planning to migrate all their virtual machines to an Azure pay-as-you-go subscription. The virtual machines are currently hosted on the Hyper-V hosts in a data center.
You are required make sure that the intended Azure solution uses the correct expenditure model.

Solution: You should recommend the use of the operational expenditure model.
Does the solution meet the goal?

A. Yes
B. No

Operational Expenditure (OpEx): Spending money on services or products continuously as they are consumed, with no upfront purchase costs. You pay for computing resources, storage, and networking on an ongoing basis (such as monthly pay-as-you-go billing) and deduct these operational costs within the same tax accounting period.Capital Expenditure (CapEx): Spending money upfront on physical assets (servers, storage arrays, network switches, cooling, real estate) and amortizing the cost over its useful lifespan.Moving from on-premises Hyper-V hosts (CapEx) to an Azure pay-as-you-go subscription transitions IT spending directly into the Operational Expenditure (OpEx) model.

Answer: A

Explanation:

Answer is Yes.

Operating expenditures are ongoing costs of doing business. Consuming cloud services in a pay-as-you-go model could qualify as an operating expenditure.

https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/strategy/business-outcomes/fiscal-outcomes

Question: 13 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are required to deploy an Artificial Intelligence (AI) solution in Azure.
You want to make sure that you are able to build, test, and deploy predictive analytics for the solution.
Solution: You should make use of Azure Cosmos DB.
Does the solution meet the goal?

A. Yes
B. No

Azure Machine Learning (Azure ML): The dedicated cloud service for building, training, evaluating, testing, and deploying machine learning models and predictive analytics solutions at scale.

Answer: B

Explanation:

Machine Learning Studio (classic) is a drag-and-drop tool you can use to build, test, and deploy predictive analytics solutions

Azure Cosmos DB is a fully managed NoSQL database for modern app development.

AI Fits with ML not with Cosmos DB so ANs B

Question: 14 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's Active Directory forest includes thousands of user accounts.
You have been informed that all network resources will be migrated to Azure. Thereafter, the on-premises data center will be retired.
You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.
Solution: You plan to sync all the Active Directory user accounts to Azure Active Directory (Azure AD).
Does the solution meet the goal?

A. Yes

B. No

When migrating enterprise workloads from an on-premises Active Directory Domain Services (AD DS) environment to Azure, synchronizing identities via Microsoft Entra Connect Sync (or Cloud Sync) brings existing identities, security groups, and password hashes into the cloud.

This allows end users to continue logging in using their familiar credentials (Same Sign-On or Seamless Single Sign-On) without needing newly provisioned usernames or password resets.

Answer: A

Explanation:

Once the on-premises infrastructure is decommissioned, synced identities can be cut over to cloud-managed identities in Microsoft Entra ID without re-creating accounts from scratch.

Use Azure AD Connect to do this.

Question: 15 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are required to deploy an Artificial Intelligence (AI) solution in Azure.
You want to make sure that you are able to build, test, and deploy predictive analytics for the solution.
Solution: You should make use of Azure Machine Learning Studio.
Does the solution meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

Machine Learning Studio (classic) is a drag-and-drop tool you can use to build, test, and deploy predictive analytics solutions.

https://docs.microsoft.com/bs-cyrl-ba/azure/machine-learning/classic/

Question: 16 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.
The resources required by each business unit are identical.
You are required to sanction a strategy to create Azure resources automatically.
Solution: You recommend that the Azure API Management service be included in the strategy.
Does the solution meet the goal?

A. Yes
B. No

Azure Resource Manager (ARM) Templates / Azure Bicep: The native Infrastructure-as-Code (IaC) solution used to define, automate, and repeatedly deploy identical sets of Azure resources consistently across business units, resource groups, or subscriptions.

Answer:

B

Explanation:

Azure API Management Service i(APIM) is a way to create and manage customer APIs for existing backend

services. The Question is asking about a way to create Azure resources automatically (on the fly). ARM (Azure Resource Manager) is a tool that automates the deployments on the AZ cloud.

Question: 17 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.
The resources required by each business unit are identical.
You are required to sanction a strategy to create Azure resources automatically.
Solution: You recommend that management groups be included in the strategy.
Does the solution meet the goal?

A. Yes
B. No

Azure Resource Manager (ARM) Templates / Azure Bicep: The native Infrastructure-as-Code (IaC) solution used to define, automate, and repeatedly deploy identical sets of Azure resources consistently across business units, resource groups, or subscriptions.

Answer: B

Explanation:

B is correct. It should be ARM template.

https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

To meet these challenges, you can automate deployments and use the practice of infrastructure as code. In code, you define the infrastructure that needs to be deployed. The infrastructure code becomes part of your project. Just like application code, you store the infrastructure code in a source repository and version it. Any one on your team can run the code and deploy similar environments.

Question: 18 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's infrastructure includes a number of business units that each need a large number of various Azure resources for everyday operation.
The resources required by each business unit are identical.
You are required to sanction a strategy to create Azure resources automatically.
Solution: You recommend that the Azure Resource Manager templates be included in the strategy.
Does the solution meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

To meet these challenges, you can automate deployments and use the practice of infrastructure as code. In

code, you define the infrastructure that needs to be deployed. The infrastructure code becomes part of your project. Just like application code, you store the infrastructure code in a source repository and version it. Any one on your team can run the code and deploy similar environments.

Question: 19 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying a critical LOB application, which will be installed on a virtual machine, to Azure.
You are informed that the application deployment strategy should allow for a guaranteed availability of 99.99 percent. You need to make sure that the strategy requires as little virtual machines and availability zones as possible.
Solution: You include two virtual machines and one availability zone in your strategy.
Does the solution meet the goal?

A. Yes
B. No

Single Instance VM: Provides up to 99.9% SLA (when configured with Premium SSD or Ultra Disk).

Availability Sets (2+ VMs): Provides 99.95% SLA (protects against local hardware/rack faults and planned updates within a single datacenter).

Availability Zones: To achieve Microsoft's highest SLA of 99.99%, you must deploy two or more VM instances across two or more Availability Zones within the same region.

Answer: B

Explanation:

Answer is NO

For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.99% of the time.

For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.

References:

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 20 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying a critical LOB application, which will be installed on a virtual machine, to Azure.
You are informed that the application deployment strategy should allow for a guaranteed availability of 99.99 percent. You need to make sure that the strategy requires as little virtual machines and availability zones as possible.
Solution: You include one virtual machine and two availability zones in your strategy.
Does the solution meet the goal?

A. Yes
B. No

Single Instance VM: Provides up to 99.9% SLA (when configured with Premium SSD or Ultra Disk).

Availability Sets (2+ VMs): Provides 99.95% SLA (protects against local hardware/rack faults and planned updates within a single datacenter).

Availability Zones: To achieve Microsoft's highest SLA of 99.99%, you must deploy two or more VM instances across two or more Availability Zones within the same region.

Answer: B

Explanation:

The answer is NO.

https://docs.microsoft.com/en-us/azure/architecture/framework/services/compute/virtual-machines/operational-excellence

95% SLA for single instance virtual machines using Standard HDD-Managed Disks for OS and Data disks.

99.5% SLA for single instance virtual machines using Standard SSD-Managed Disks for OS and Data disks.

99.9% SLA for single instance virtual machines using Premium SSD or Ultra Disk for all OS and Data disks.

99.95% SLA for all virtual machines that have two or more instances in the same Availability Set or Dedicated Host Group.

99.99% SLA for all virtual machines that have two or more instances deployed across two or more Availability Zones in the same region.

References:

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 21 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are tasked with deploying a critical LOB application, which will be installed on a virtual machine, to Azure.
You are informed that the application deployment strategy should allow for a guaranteed availability of 99.99 percent. You need to make sure that the strategy requires as little virtual machines and availability zones as possible.
Solution: You include two virtual machines and two availability zones in your strategy.
Does the solution meet the goal?

A. Yes
B. No

Single Instance VM: Provides up to 99.9% SLA (when configured with Premium SSD or Ultra Disk).

Availability Sets (2+ VMs): Provides 99.95% SLA (protects against local hardware/rack faults and planned updates within a single datacenter).

Availability Zones: To achieve Microsoft's highest SLA of 99.99%, you must deploy two or more VM instances across two or more Availability Zones within the same region.

Answer:

A

Explanation:

2VMs + 2 Zones equal great fail over and 99.9% uptime

For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.99% of the time.

For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.

For any Single Instance Virtual Machine using Premium SSD or Ultra Disk for all Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.9%.

For any Single Instance Virtual Machine using Standard SSD Managed Disks for Operating System Disk and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 99.5%.

For any Single Instance Virtual Machine using Standard HDD Managed Disks for Operating System Disks and Data Disks, we guarantee you will have Virtual Machine Connectivity of at least 95%.

References:

https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 22 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.
You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.
Solution: You recommend the use of Microsoft Managed Desktop.
Does the solution meet the goal?

A. Yes
B. No

Azure DevTest Labs: The purpose-built Azure service designed specifically for developers to quickly self-provision pre-configured Windows and Linux virtual machines using custom images, formulas, and artifacts, with automated shutdown and expiration policies to automatically discard VMs when done.

Answer: B

Explanation:

Answer correct. It is not Microsoft Managed Desktop. The correct answer should be Azure DevTest Labs.

Welcome to Microsoft Managed Desktop

Microsoft Managed Desktop brings together Microsoft 365 Enterprise, cloud-based device management by Microsoft, and security monitoring, enabling you to free your IT team to focus on core business needs. Currently, the Microsoft Managed Desktop service is offered only by invitation. Learn more on Microsoft docs or contact your Microsoft account manager. If you're unfamiliar with Microsoft Managed Desktop, learn more about the service.

Question: 23 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.
You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.
Solution: You recommend the use of Azure Reserved Virtual Machines (VM) Instances.
Does the solution meet the goal?

A. Yes
B. No

Azure Reservations (Reserved VM Instances): A pricing commitment model where you commit to a one-year or three-year plan for compute resources in exchange for significant billing discounts compared to pay-as-you-go rates. Reserved Instances are purely a cost-saving billing mechanism for stable, predictable, long-running production workloads. They do not automate VM provisioning, configuration, or lifecycle de-provisioning.

Answer: B

Azure DevTest Labs: The purpose-built service designed to reduce administrative overhead when provisioning and automatically tearing down transient, short-lived development and testing environments (featuring reusable custom images, artifacts, and auto-shutdown/auto-delete policies).

Explanation:

The correct answer is B.

Azure DevTest Labs enable you to quickly create environments using reusable templates and artifacts.

Reserved not a tool, it is a method pricing

Question: 24 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's developers intend to deploy a large number of custom virtual machines on a weekly basis. They will also be removing these virtual machines during the same week it was deployed. Sixty percent of the virtual machines have Windows Server 2016 installed, while the other forty percent has Ubuntu Linux installed.
You are required to make sure that the administrative effort, needed for this process, is reduced by employing a suitable Azure service.
Solution: You recommend the use of Azure DevTest Labs.
Does the solution meet the goal?

A. Yes
B. No

Azure DevTest Labs: The purpose-built service designed to reduce administrative overhead when provisioning and automatically tearing down transient, short-lived development and testing environments (featuring reusable custom images, artifacts, and auto-shutdown/auto-delete policies).

Answer: A

Explanation:

Use DevTest Labs for free*

Quickly provision development and test environments

Minimize waste with quotas and policies

Set automated shutdowns to minimize costs

Build Windows and Linux environments

Question: 25 CertyIQ

Your company has virtual machines (VMs) hosted in Microsoft Azure. The VMs are located in a single Azure virtual network named VNet1.
The company has users that work remotely. The remote workers require access to the VMs on VNet1.
You need to provide access for the remote workers.
What should you do?

A. Configure a Site-to-Site (S2S) VPN.
B. Configure a VNet-toVNet VPN.
C. Configure a Point-to-Site (P2S) VPN.
D. Configure DirectAccess on a Windows Server 2012 server VM.
E. Configure a Multi-Site VPN

Point-to-Site (P2S) VPN: Enables a secure encrypted tunnel from an individual client computer back to an Azure virtual network. It is specifically intended for telecommuters, mobile workers, and remote employees connecting from home or external locations without requiring an on-premises VPN hardware appliance.

Site-to-Site (S2S) VPN: Connects an entire on-premises branch office or corporate data center network to an Azure VNet via an edge VPN gateway device, not individual mobile client endpoints.

Answer: C

Explanation:
A Point-to-Site (P2S) VPN gateway connection lets you create a secure connection to your virtual network from an individual client computer.

Reference:
https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-about-vpngateways

Question: 26 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You have been informed by your superiors of the company's intentions to automate server deployment to Azure.
There is, however, some concern that administrative credentials could be uncovered during this process.
You are required to make sure that during the deployment, the administrative credentials are encrypted using a suitable Azure solution.
Solution: You recommend the use of Azure Information Protection.
Does the solution meet the goal?

A. Yes
B. No

Azure Key Vault: The centralized cloud service engineered specifically to securely store, encrypt, and manage application secrets, tokens, passwords, certificates, and API keys. During automated deployments (such as via ARM templates, Bicep, or Terraform), administrative credentials can be retrieved dynamically from Azure Key Vault without being exposed in plaintext scripts or code repositories.

Answer:

B

Explanation:

B. No, answer -> It should be Key Vault

Azure Information Protection (AIP) is a cloud-based solution that enables organizations to discover, classify, and protect documents and emails by applying labels to content.

Question: 27 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You have been informed by your superiors of the company's intentions to automate server deployment to Azure.
There is, however, some concern that administrative credentials could be uncovered during this process.
You are required to make sure that during the deployment, the administrative credentials are encrypted using a suitable Azure solution.
Solution: You recommend the use of Azure Multi-Factor Authentication (MFA).
Does the solution meet the goal?

A. Yes
B. No

Azure Key Vault: The centralized cloud service engineered specifically to securely store, encrypt, and manage application secrets, tokens, passwords, certificates, and API keys. During automated deployments (such as via ARM templates, Bicep, or Terraform), administrative credentials can be retrieved dynamically from Azure Key Vault without being exposed in plaintext scripts or code repositories.

Answer: B

Explanation:

B. No - does not meet goal due to MFA is used to add authentication layer for user access, not to encrypt credentials. Correct solution is Azure Key Vault.

Question: 28 CertyIQ

DRAG DROP -
The company would like to develop a cloud solution by making use of Azure Government. Azure Government can only be used by certain types of clients to develop cloud solutions.
Which of the following are the types of customers that can make use of Azure Government in this situation?
Answer by dragging the correct option from the list to the answer area.
Select and Place:

Options	Answer
A government contractor from any country.	
A government entity from any country.	
A European government contractor.	
A European government entity.	
A United States government contractor.	
A United States government entity.	

A United States government entity.

A United States government contractor.

Concept: Sovereign / Specialized Cloud Offerings (Azure Government).

Under official Microsoft Learn standards:

Azure Government is a dedicated, physically and logically isolated cloud instance designed specifically to meet the stringent security, compliance, and regulatory standards of the United States public sector (such as FedRAMP High, DoD Impact Levels, CJIS, and ITAR).

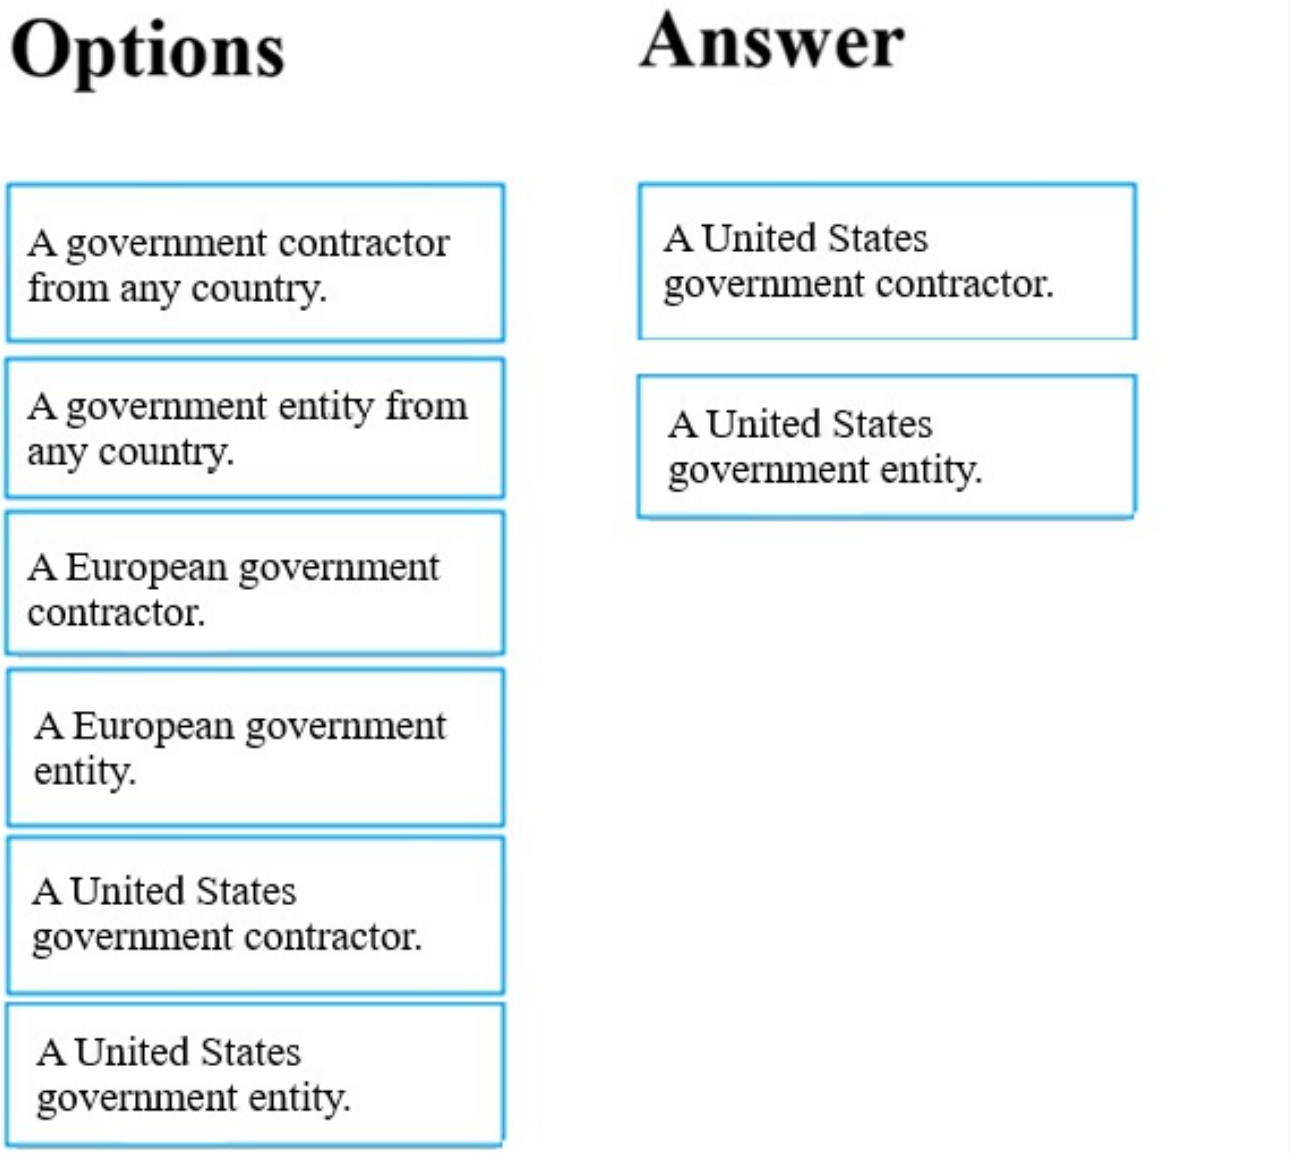
Eligibility is strictly restricted to:

US federal, state, local, and tribal government agencies / entities.

US government commercial contractors and partners who provide solutions and services to authorized US government entities (subject to validation and screening).

Entities from other sovereign nations or international governments are not eligible for Azure Government; they use global Azure regions or their respective sovereign/local instances where available (e.g., Azure China 21Vianet).

Answer:



Explanation:

Azure Government is the mission-critical cloud, delivering breakthrough innovation to US government customers and their partners. Only US federal, state, local, and tribal governments and their partners have access to this dedicated instance. (https://azure.microsoft.com/en-us/global-infrastructure/government/get-started/)

References:

https://docs.microsoft.com/en-us/learn/modules/intro-to-azure-government/2-what-is-azure-government

Question: 29 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company has an Azure Active Directory (Azure AD) environment. Users occasionally connect to Azure AD via the Internet.
You have been tasked with making sure that users who connect to Azure AD via the internet from an unidentified IP address, are automatically encouraged to change passwords.
Solution: You configure the use of Azure AD Identity Protection.
Does the solution meet the goal?

A. Yes

B. No

Microsoft Entra ID Protection utilizes machine learning algorithms and heuristic intelligence to detect anomalies, suspicious sign-in behavior, and potential credential compromises.An unfamiliar sign-in property (such as signing in from an unidentified/new IP address or anonymous IP address) generates a sign-in risk or user risk event.Administrators can configure risk-based remediation policies (such as a User risk policy or Sign-in risk policy via Conditional Access) that automatically trigger a secure password reset and remediation flow when suspicious risk conditions are detected.

Answer: A

Explanation:

Risk detection and remediation

Identity Protection identifies risks of many types, including:

Anonymous IP address use

Atypical travel

Malware linked IP address

Unfamiliar sign-in properties

Leaked credentials

Password spray

References:

https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy

Question: 30

CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company has an Azure Active Directory (Azure AD) environment. Users occasionally connect to Azure AD via the Internet.
You have been tasked with making sure that users who connect to Azure AD via the internet from an unidentified IP address, are automatically encouraged to change passwords.
Solution: You configure the use of Azure AD Privileged Identity Management.
Does the solution meet the goal?

A. Yes

B. No

Privileged Identity Management (PIM): A service that enables organizations to manage, control, and monitor access to critical Azure and Entra resources. It provides just-in-time (JIT) access, time-bound role assignment, approval workflows, and access reviews for highly privileged administrative accounts. It does not monitor external client IP addresses, evaluate user/sign-in risk levels, or automate password resets.

Answer: B

Explanation:

Microsoft Entra ID Protection (formerly Azure AD Identity Protection): The service that flags anomalous or unidentified IP sign-in events using heuristic machine learning and applies automated remediation policies (such as enforcing a self-service password change upon high user risk).

Answer is No

Azure Information Protection (AIP) is a cloud-based solution that enables organizations to discover, classify, and protect documents and emails by applying labels to content.

Solution : Azure Key Vault

Privileged Identity Management provides time-based and approval-based role activation to mitigate the risks of excessive, unnecessary, or misused access permissions on resources that you care about. Here are some of the key features of Privileged Identity Management:

Provide just-in-time privileged access to Azure AD and Azure resources

Assign time-bound access to resources using start and end dates

Require approval to activate privileged roles

Enforce multi-factor authentication to activate any role

Use justification to understand why users activate

Get notifications when privileged roles are activated

Conduct access reviews to ensure users still need roles

Download audit history for internal or external audit

Prevents removal of the last active Global Administrator role assignment

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machines/infrastructure-automation

References:

https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy

Question: 31 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are planning a strategy to deploy numerous web servers and database servers to Azure.
This strategy should allow for connection types between the web servers and database servers to be controlled.
Solution: You include network security groups (NSGs) in your strategy.
Does the solution meet the goal?

A. Yes

B. No

A Network Security Group (NSG) contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources (such as virtual network subnets or individual network interfaces / NICs).

Answer:

A

In a standard multi-tier deployment (e.g., web tier and database tier), an NSG applied to the database subnet can be configured with security rules that restrict traffic so that database ports (e.g., TCP port 1433 for SQL Server) only accept inbound connections originating from the web servers' subnet or an Application Security Group (ASG), while denying all other connection types.

Explanation:

You can use an Azure network security group to filter network traffic to and from Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. For each rule, you can specify source and destination, port, and protocol.

Question: 32 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
You are planning a strategy to deploy numerous web servers and database servers to Azure.
This strategy should allow for connection types between the web servers and database servers to be controlled.

Solution: You include a local network gateway in your strategy.
Does the solution meet the goal?

A. Yes
B. No

A Local Network Gateway is an Azure resource that represents your on-premises physical location (edge device) in a Site-to-Site (S2S) VPN connection. It defines the on-premises gateway's public IP address and local IP address prefixes/subnets so Azure knows where to route hybrid cross-premises traffic.

A local network gateway cannot filter, inspect, permit, or deny connection types or protocols between workloads deployed inside Azure virtual networks.

Answer: B

Explanation: Controlling connection types and network protocols between internal web and database tiers requires Network Security Groups (NSGs) or Application Security Groups (ASGs).

B. No - the local NG is to connect between local and virtual networks (or VPN for private access). The Network Security Group would meet the goal.

Question: 33 CertyIQ

Note: The question is included in a number of questions that depicts the identical set-up. However, every question has a distinctive result. Establish if the solution satisfies the requirements.
Your company's Active Directory forest includes thousands of user accounts.
You have been informed that all network resources will be migrated to Azure. Thereafter, the on-premises data center will be retired.
You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.
Solution: You plan to require Azure Multi-Factor Authentication (MFA).
Does the solution meet the goal?

A. Yes
B. No

The objective is to reduce the disruption and effect on end users when transitioning thousands of accounts from an on-premises Active Directory forest to Azure. The standard method to achieve this is synchronizing accounts via Microsoft Entra Connect (Azure AD Connect) so users retain their existing credentials, UPNs, and passwords.

Answer: B

Explanation: Azure Multi-Factor Authentication (MFA): A security control that adds a second form of verification (e.g., authenticator app prompt, SMS, or FIDO2 key) during sign-in. While MFA enhances security, it does nothing to migrate or preserve account identities, and requiring it actually adds a step to the user sign-in flow rather than minimizing migration disruption

MFA is not going to help reduce the issues with users. It will tighten security but what you really need here is Azure Sync to AAD

"You are required to employ a strategy that reduces the effect on users, once the planned migration has been completed.". Multi-factor authentication doesn't reduce the effect or have any kind of effect on this issue. MFA is used to verify the reinforce the security to identify a user, but it doesn't help at all in arranging the user's accounts

Question: 34 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Operating System Management (Statement 1): In a PaaS offering (such as Azure App Service), the cloud service provider manages the operating system, hardware, virtualization layer, OS patching, and network infrastructure.

Automatic Scaling (Statement 2): PaaS web hosting in Azure natively features Autoscale capabilities. You can configure rules to automatically scale compute instances in and out based on demand metrics

Development Services (Statement 3): Azure PaaS provides hosting infrastructure, application runtimes, and developer tooling (e.g., CI/CD integration, deployment slots, SDKs). It does not provide human software developers or managed professional consulting services to write or continuously build business features for your custom application.

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	○
A platform as a service (PaaS) solution that hosts web apps in Azure provides the ability to scale the platform automatically.	○	○
A platform as a service (PaaS) solution that hosts web apps in Azure provides professional development services to continuously add features to custom applications.	○	○

Answer:

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	●
A platform as a service (PaaS) solution that hosts web apps in Azure provides the ability to scale the platform automatically.	●	○
A platform as a service (PaaS) solution that hosts web apps in Azure provides professional development services to continuously add features to custom applications.	●	○

Explanation:

Box 1: No -

A PaaS solution does not provide access to the operating system. The Azure Web Apps service provides an environment for you to host your web applications.

Behind the scenes, the web apps are hosted on virtual machines running IIS. However, you have no direct access to the virtual machine, the operating system or

IIS.

Box 2: Yes -

A PaaS solution that hosts web apps in Azure does provide the ability to scale the platform automatically. This is known as autoscaling. Behind the scenes, the web apps are hosted on virtual machines running IIS. Autoscaling means adding more load balanced virtual machines to host the web apps.

Box 3: Yes -

PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. PaaS development tools can cut the time it takes to code new apps with pre-coded application components built into the platform, such as workflow, directory services, security features, search and so on.

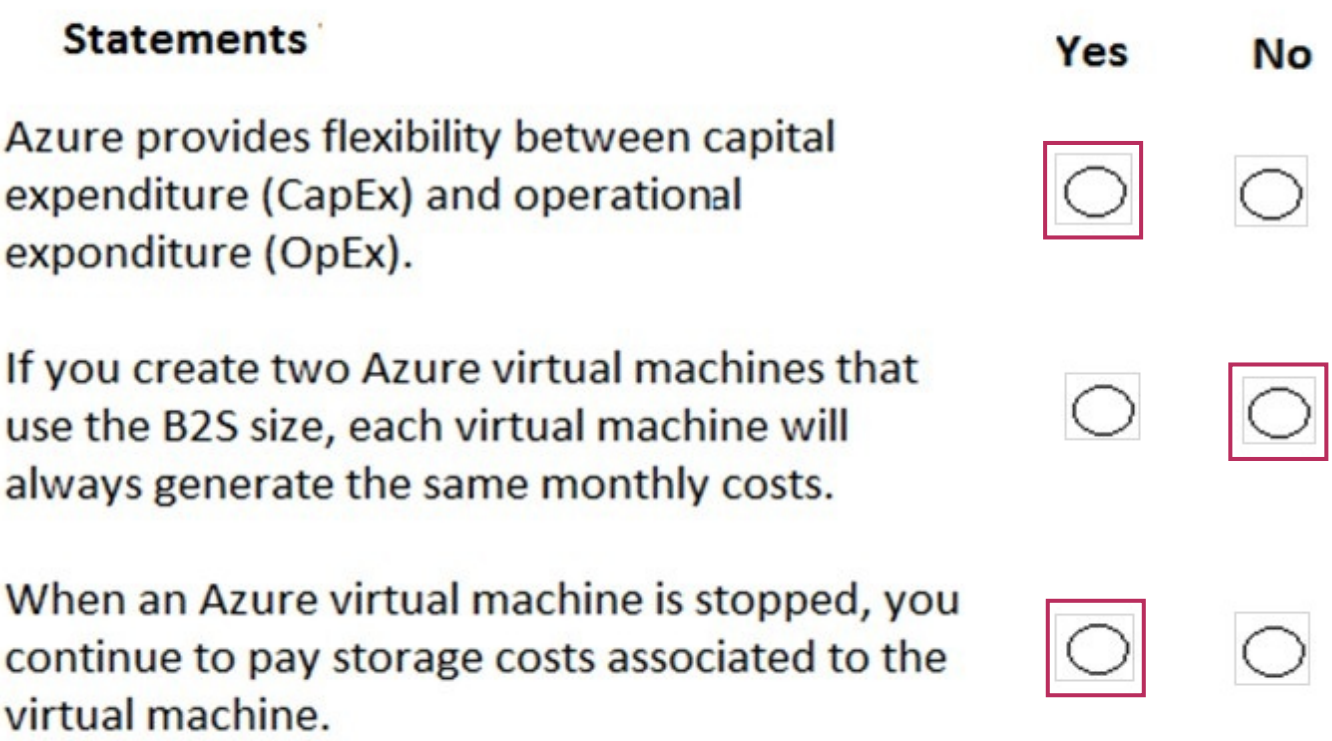
References:

https://azure.microsoft.com/en-gb/overview/what-is-paas/

Question: 35 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area



Statement 1 (CapEx vs. OpEx Flexibility - Yes): While public cloud compute defaults to an OpEx (pay-as-you-go) model, Azure allows organizations to balance CapEx and OpEx based on financial strategy. Organizations can leverage CapEx through upfront commitments like Azure Reserved Virtual Machine Instances (1-year or 3-year single upfront payment) or Azure Hybrid Benefit (applying existing on-premises software capital investments to cloud VMs).

Answer:

Statement 2 (Identical VM Costs - No): The monthly cost of two identical VM sizes (such as B2S) is not fixed or guaranteed to be identical:

Uptime / Runtime hours: If VM A runs 24/7 (730 hours/month) and VM B runs for 20 hours/month, their compute charges differ drastically.

Region: Deploying a B2S VM in East US carries a different hourly rate than deploying the same B2S VM in Brazil South or Australia East.

Storage & Egress Bandwidth: Disks attached (Standard HDD vs. Premium SSD), disk sizes, outbound data transfer, and static public IP assignments all introduce distinct variable monthly costs.

Statement 3 (Storage Costs When VM Stopped - Yes): Stopping/deallocating an Azure virtual machine releases its compute cores and RAM, stopping compute hourly charges. However, the virtual hard disks (OS disk and any attached data disks) remain provisioned in Azure Storage to retain the VM's state and data, continuing to accrue storage capacity costs.

Answer Area

Statements	Yes	No
Azure provides flexibility between capital expenditure (CapEx) and operational exponditure (OpEx).	○	○
If you create two Azure virtual machines that use the B2S size, each virtual machine will always generate the same monthly costs.	○	○
When an Azure virtual machine is stopped, you continue to pay storage costs associated to the virtual machine.	○	○

Explanation:
Box 1: Yes -
Traditionally, IT expenses have been considered a Capital Expenditure (CapEx). Today, with the move to the cloud and the pay-as-you-go model, organizations have the ability to stretch their budgets and are shifting their IT CapEx costs to Operating Expenditures (OpEx) instead. This flexibility, in accounting terms, is now an option due to the as a Service model of purchasing software, cloud storage and other IT related resources.

Box 2: No -
Two virtual machines using the same size could have different disk configurations. Therefore, the monthly costs could be different.

Box 3: Yes -
When an Azure virtual machine is stopped, you don't pay for the virtual machine. However, you do still pay for the storage costs associated to the virtual machine.
The most common storage costs are for the disks attached to the virtual machines. There are also other storage costs associated with a virtual machine such as storage for diagnostic data and virtual machine backups.

Reference:
https://meritsolutions.com/capex-vs-opex-cloud-computing-blog/

Question: 36 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability.
- defining scalability rules.
- installing the SaaS solution.
- configuring the SaaS solution.

In a SaaS model (e.g., Microsoft 365, Dynamics 365), the cloud service provider provisions, installs, patches, secures, maintains, and ensures high availability/scalability for the underlying infrastructure and software runtime.

The customer's role is strictly limited to managing their data, identities, device access, and configuring application-level settings (such as business rules, role assignments, user access permissions, and feature toggles) within the SaaS environment

Answer:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability.
- defining scalability rules.
- installing the SaaS solution.
- configuring the SaaS solution.

Explanation:

When you are implementing a Software as a Service (SaaS) solution, you are responsible for configuring the SaaS solution. Everything else is managed by the cloud provider.

SaaS requires the least amount of management. The cloud provider is responsible for managing everything, and the end user just uses the software.

Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring and office tools
(such as Microsoft Office 365).

SaaS provides a complete software solution which you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure, middleware, app software and app data are located in the service provider's data center. The service provider manages the hardware and software and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well.

Reference:
https://azure.microsoft.com/en-in/overview/what-is-saas/
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/5-types-of-cloud-services

Question: 37 CertyIQ

You have an on-premises network that contains several servers.
You plan to migrate all the servers to Azure.
You need to recommend a solution to ensure that some of the servers are available if a single Azure data center goes offline for an extended period.
What should you include in the recommendation?

A. fault tolerance
B. elasticity
C. scalability
D. low latency

Fault Tolerance: The ability of a system to remain operational and continue providing service without interruption even when one or more of its underlying hardware, software, or physical datacenter components experience a total failure. Deploying workloads across Azure Availability Zones (separate physical data centers with independent power, cooling, and networking) provides datacenter-level fault tolerance.

While high availability focuses on minimizing overall downtime, fault tolerance specifically describes a design where a complete failure of an entire physical facility (data center) allows services to persist without operational disruption.

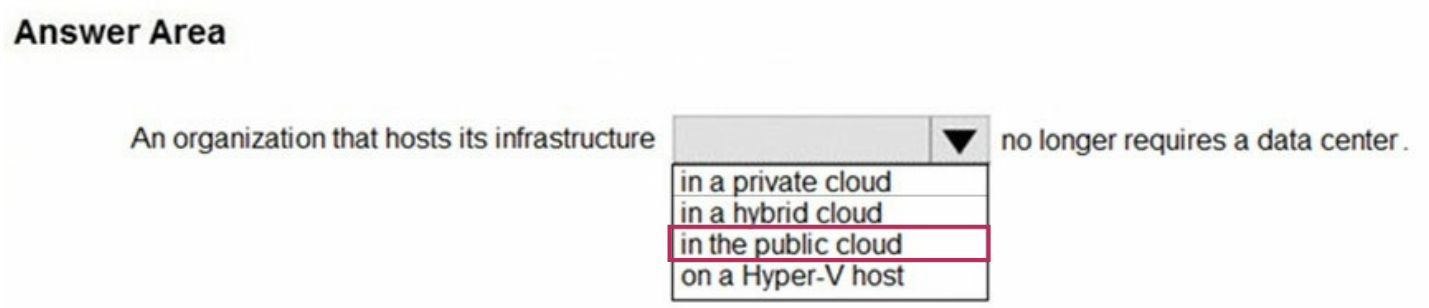
Answer: A

Explanation:
Fault tolerance is the ability of a system to continue to function in the event of a failure of some of its components.
In this question, you could have servers that are replicated across datacenters.
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there are a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures.
With Availability Zones, Azure offers industry best 99.99% VM uptime SLA. By architecting your solutions to use replicated VMs in zones, you can protect your applications and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

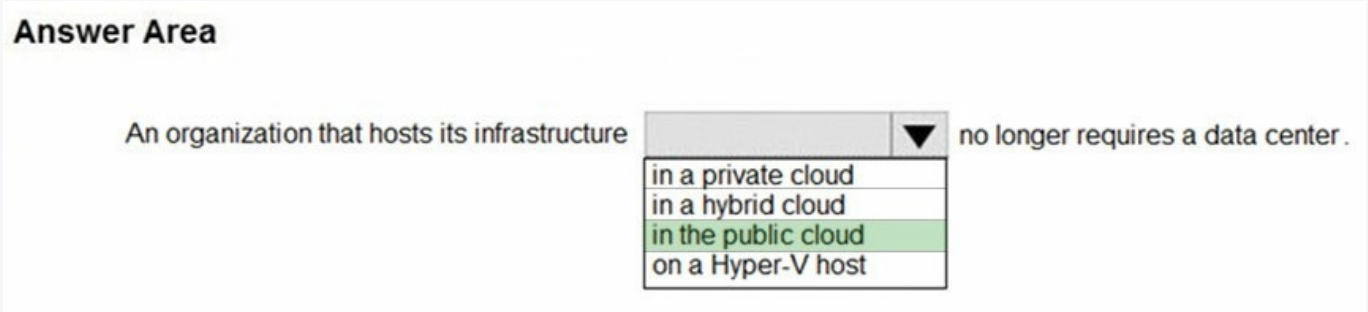
Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/manage-availability

Question: 38 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



Explanation:
A private cloud is hosted in your datacenter. Therefore, you cannot close your datacenter if you are using a private cloud.
A public cloud is hosted externally, for example, in Microsoft Azure. An organization that hosts its

infrastructure in a public cloud can close its data center.
Public cloud is the most common deployment model. In this case, you have no local hardware to manage or keep up-to-date " everything runs on your cloud provider's hardware.
Microsoft Azure is an example of a public cloud provider.
In a private cloud, you create a cloud environment in your own datacenter and provide self-service access to compute resources to users in your organization.
This offers a simulation of a public cloud to your users, but you remain completely responsible for the purchase and maintenance of the hardware and software services you provide.

Reference:
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/4-cloud-deployment-models

Question: 39 CertyIQ

What are two characteristics of the public cloud? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. dedicated hardware
B. unsecured connections
C. limited storage
D. metered pricing
E. self-service management

Metered Pricing (Pay-as-you-go): Public cloud services operate on a consumption-based expenditure model where organizations pay only for the compute cycles, storage gigabytes, and bandwidth consumed (metered usage), eliminating massive upfront capital investments.

Self-Service Management: Consumers provision, configure, monitor, scale, and decommission cloud resources on demand using self-service web portals (Azure Portal), command-line tools (Azure CLI, PowerShell), or automation APIs without requiring manual intervention from the cloud provider's staff.

Answer: DE

Public cloud infrastructure is shared across multiple tenants (multi-tenant shared hardware) owned and maintained entirely by the cloud provider (Microsoft).

Explanation:
With the public cloud, you get pay-as-you-go pricing " you pay only for what you use, no CapEx costs.
With the public cloud, you have self-service management. You are responsible for the deployment and configuration of the cloud resources such as virtual machines or web sites. The underlying hardware that hosts the cloud resources is managed by the cloud provider.
Incorrect Answers:
A: You don't have dedicated hardware. The underlying hardware is shared so you could have multiple customers using cloud resources hosted on the same physical hardware.
B: Connections to the public cloud are secure.
C: Storage is not limited. You can have as much storage as you like.

Reference:
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/4-cloud-deployment-models

Question: 40 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure.
- reduce the number of connections to the website.

Answer:

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure.
- reduce the number of connections to the website.

Explanation:

When planning to migrate a public website to Azure, you must plan to pay monthly usage costs. This is because Azure uses the pay-as-you-go model.

Question: 41 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create an Azure App Service and Azure SQL databases.
Does this meet the goal?

A. Yes
B. No

Azure App Service: A fully managed Platform as a Service (PaaS) hosting environment for web applications, REST APIs, and mobile back ends. Azure manages the operating system, infrastructure patching, network scaling, and web server configuration.

Azure SQL Database: A fully managed PaaS relational database service running on the latest stable Enterprise Edition of the Microsoft SQL Server database engine. Hardware provisioning, OS patching, backups, and high availability are managed automatically by Microsoft.

Answer: A

Explanation: Because both components deployed in the solution (Azure App Service and Azure SQL Database) are classified as PaaS, the solution satisfies the requirement that only PaaS solutions must be used.
Azure App Service and Azure SQL databases are examples of Azure PaaS solutions. Therefore, this solution

does meet the goal.

Question: 42 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create an Azure App Service and Azure virtual machines that have Microsoft SQL Server installed.
Does this meet the goal?

A. Yes
B. No

Azure App Service: A fully managed Platform as a Service (PaaS) hosting environment for web applications, REST APIs, and mobile back ends. Azure manages the operating system, infrastructure patching, network scaling, and web server configuration.

Azure SQL Database: A fully managed PaaS relational database service running on the latest stable Enterprise Edition of the Microsoft SQL Server database engine. Hardware provisioning, OS patching, backups, and high availability are managed automatically by Microsoft.

Answer: B

Explanation: Because both components deployed in the solution (Azure App Service and Azure SQL Database) are classified as PaaS, the solution satisfies the requirement that only PaaS solutions must be used.

1. Azure Disk Storge is IaaS and Azure Blob Storage is PaaS. So it has not mention properly which service the developer used so the answer is no

2. VM = IaaS where App Service I remember as something like Docker which is a PlatformNo would be the correct answer here because of the VM.

Question: 43 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create an Azure App Service and Azure Storage accounts.
Does this meet the goal?

A. Yes
B. No

Azure App Service: A fully managed Platform as a Service (PaaS) engine for building and hosting web apps, mobile app back ends, and RESTful APIs without managing infrastructure or operating systems.

Azure Storage Accounts (Blob, Files, Queues, Tables): Classified by Microsoft as a PaaS offering. Azure abstracts the underlying physical servers, disk hardware, RAID configurations, operating system maintenance, and storage fabric updates. The user manages only their stored data, security keys, access tiers, and permissions.

Answer: B

Explanation: Because both Azure App Service and Azure Storage accounts are PaaS services, deploying them adheres strictly to the requirement that only PaaS solutions are used.

Azure Storage is a PaaS

Azure Storage ACCOUNTS are not. Therefore B, No.

An Azure Storage Account is not IaaS or PaaS because it is not a "service". An Azure Storage Account is a container for one of the Azure storage solutions; Azure Disk Storage(IaaS), Azure Blob Storage(PaaS), and

Azure File Storage(SaaS).

https://docs.microsoft.com/en-us/learn/modules/azure-networking-fundamentals/azure-virtual-network-fundamentals

Question: 44 CertyIQ

Your company hosts an accounting application named App1 that is used by all the customers of the company. App1 has low usage during the first three weeks of each month and very high usage during the last week of each month.
Which benefit of Azure Cloud Services supports cost management for this type of usage pattern?

A. high availability
B. high latency
C. elasticity
D. load balancing

Elasticity: The ability of a cloud platform to dynamically provision and de-provision computing resources automatically (scaling out/in or up/down) in direct response to fluctuating workload demands.

For cyclical or bursty workloads—such as end-of-month accounting reconciliations—elasticity supports cost management by ensuring you only pay for high-capacity compute resources during peak demand (the last week) and automatically scale down to minimal capacity during idle periods (the first three weeks), preventing wasted expenditure on over-provisioned idle infrastructure.

Answer: C

Explanation:
Elasticity in this case is the ability to provide additional compute resource when needed and reduce the compute resource when not needed to reduce costs.
Autoscaling is an example of elasticity.
Elastic computing is the ability to quickly expand or decrease computer processing, memory and storage resources to meet changing demands without worrying about capacity planning and engineering for peak usage. Typically controlled by system monitoring tools, elastic computing matches the amount of resources allocated to the amount of resources actually needed without disrupting operations. With cloud elasticity, a company avoids paying for unused capacity or idle resources and doesn't have to worry about investing in the purchase or maintenance of additional resources and equipment.

Reference:
https://azure.microsoft.com/en-gb/overview/what-is-elastic-computing/

Question: 45 CertyIQ

You plan to migrate a web application to Azure. The web application is accessed by external users.
You need to recommend a cloud deployment solution to minimize the amount of administrative effort used to manage the web application.
What should you include in the recommendation?

A. Software as a Service (SaaS)
B. Platform as a Service (PaaS)
C. Infrastructure as a Service (IaaS)
D. Database as a Service (DaaS)

When migrating an existing custom web application to Azure, Platform as a Service (PaaS) minimizes administrative effort by offloading the operating system, web server runtime (IIS, Apache, NGINX), patching, scaling, and physical hardware management to Microsoft.

The organization only manages the application code and deployment configurations.

Answer: B

Explanation:

The keywords are "migrate" and "administration"

Azure App Service is a platform-as-a-service (PaaS) offering that lets you create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises. App Service includes the web and mobile capabilities that were previously delivered separately as Azure Websites and Azure Mobile

Services.

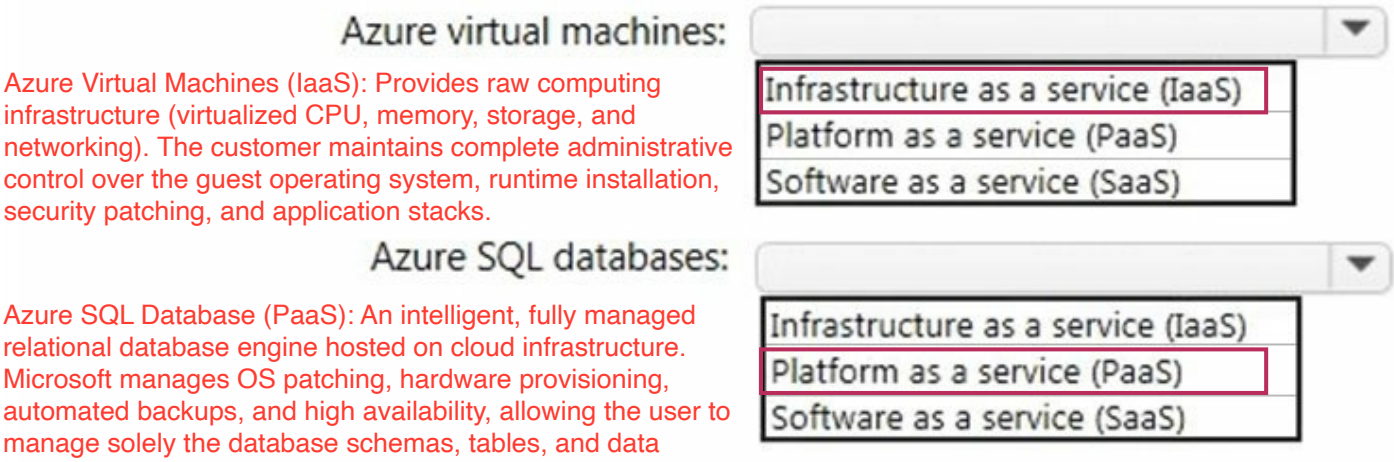
https://docs.microsoft.com/en-us/azure/security/fundamentals/paas-applications-using-app-services

Question: 46 CertyIQ

HOTSPOT -
Which cloud deployment solution is used for Azure virtual machines and Azure SQL databases? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

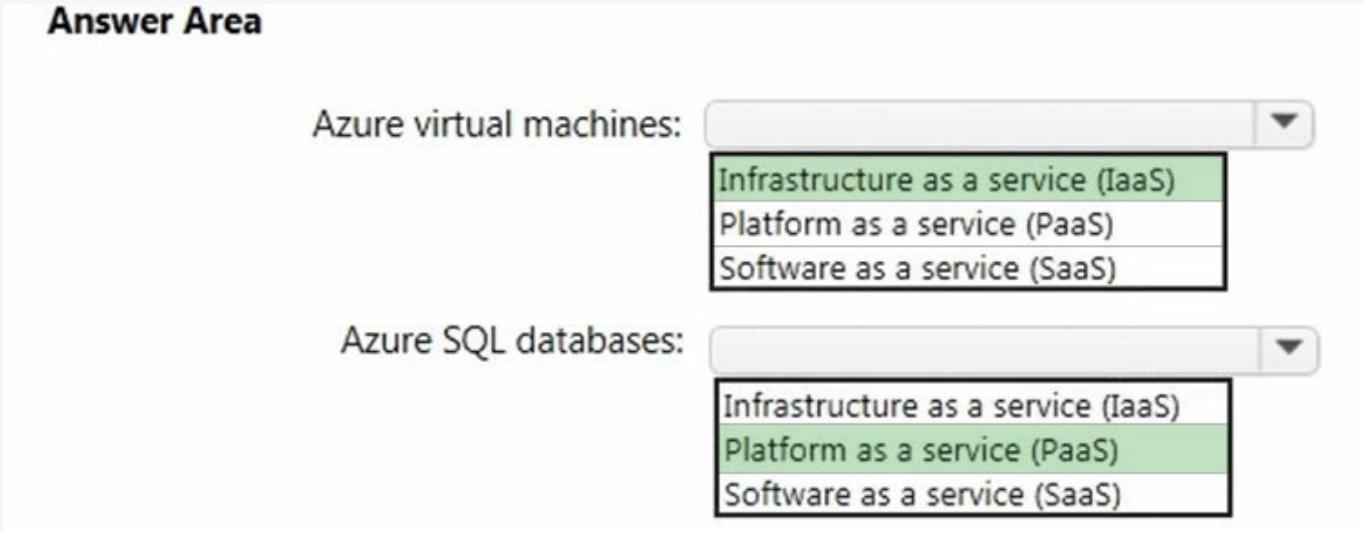


Azure Virtual Machines (IaaS): Provides raw computing infrastructure (virtualized CPU, memory, storage, and networking). The customer maintains complete administrative control over the guest operating system, runtime installation, security patching, and application stacks.

Azure SQL Database (PaaS): An intelligent, fully managed relational database engine hosted on cloud infrastructure. Microsoft manages OS patching, hardware provisioning, automated backups, and high availability, allowing the user to manage solely the database schemas, tables, and data without server-level administrative burdens.

Answer:

Answer Area



Explanation:
Box 1:
Azure virtual machines are Infrastructure as a Service (IaaS).
Infrastructure as a Service is the most flexible category of cloud services. It aims to give you complete control over the hardware that runs your application (IT infrastructure servers and virtual machines (VMs), storage,

networks, and operating systems). Instead of buying hardware, with IaaS, you rent it.
Box 2:
Azure SQL databases are Platform as a Service (Paas).
Azure SQL Database is a fully managed Platform as a Service (PaaS) Database Engine that handles most of the database management functions such as upgrading, patching, backups, and monitoring without user involvement. Azure SQL Database is always running on the latest stable version of SQL Server Database Engine and patched OS with 99.99% availability. PaaS capabilities that are built-in into Azure SQL database enable you to focus on the domain specific database administration and optimization activities that are critical for your business.

Reference:
https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/5-types-of-cloud-services
https://docs.microsoft.com/en-us/azure/sql-database/sql-database-paas-index

Question: 47 CertyIQ

You have an on-premises network that contains 100 servers.
You need to recommend a solution that provides additional resources to your users. The solution must minimize capital and operational expenditure costs.
What should you include in the recommendation?

A. a complete migration to the public cloud
B. an additional data center
C. a private cloud
D. a hybrid cloud

Hybrid Cloud: Combines an existing on-premises infrastructure (private environment) with public cloud services.

The organization already has 100 operational servers representing existing capital investments. Rather than purchasing new physical servers/data centers (incurring heavy CapEx) or undertaking an expensive, immediate full-scale re-architecture and migration of all 100 existing servers (incurring massive immediate migration and migration OpEx costs), adopting a hybrid cloud allows the organization to keep existing workloads on-premises while bursting or expanding only the additional required capacity into the public cloud on a pay-as-you-go basis.

Answer: D

Explanation:

This minimizes new CapEx (zero new on-premises hardware purchases) and optimizes OpEx (paying only for the marginal additional cloud resources)

Correct answer is D - Hybrid cloud. Utilize current resources and dynamically scale in public cloud if and when needed.

A hybrid cloud is a combination of a private cloud and a public cloud.

Capital expenditure is the spending of money up-front for infrastructure such as new servers.

With a hybrid cloud, you can continue to use the on-premises servers while adding new servers in the public cloud (Azure for example). Adding new servers in

Azure minimizes the capital expenditure costs as you are not paying for new servers as you would if you deployed new server on-premises.

Incorrect Answers:

A: A complete migration of 100 servers to the public cloud would involve a lot of operational expenditure (the cost of migrating all the servers).

B: An additional data center would involve a lot of capital expenditure (the cost of the new infrastructure).

C: A private cloud is hosted on on-premises servers to this would involve a lot of capital expenditure (the cost of the new infrastructure to host the private cloud).

https://docs.microsoft.com/en-gb/learn/modules/principles-cloud-computing/4-cloud-deployment-models

Question: 48 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
To achieve a hybrid cloud model, a company must always migrate from a private cloud model.	○	○
A company can extend the capacity of its internal network by using the public cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
To achieve a hybrid cloud model, a company must always migrate from a private cloud model.	○	○
A company can extend the capacity of its internal network by using the public cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Explanation:
Box 1: No -
It is not true that a company must always migrate from a private cloud model to implement a hybrid cloud. You could start with a public cloud and then combine that with an on-premise infrastructure to implement a hybrid cloud.

Box 2: Yes -
A company can extend the capacity of its internal network by using the public cloud. This is very common. When you need more capacity, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Box 3: No -
It is not true that only guest users can access cloud resources. You can give anyone with an account in Azure Active Directory access to the cloud resources.
There are many authentication scenarios but a common one is to replicate your on-premises Active Directory accounts to Azure Active Directory and provide access to the Azure Active Directory accounts. Another commonly used authentication method is 'Federation' where authentication for access to cloud resources is passed to another authentication provider such as an on-premises Active Directory.
https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 49 CertyIQ

You plan to migrate several servers from an on-premises network to Azure.
What is an advantage of using a public cloud service for the servers over an on-premises network?

A. The public cloud is owned by the public, NOT a private corporation

B. The public cloud is a crowd-sourcing solution that provides corporations with the ability to enhance the cloud

C. All public cloud resources can be freely accessed by every member of the public

D. The public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud

Answer: D

Explanation:

The public cloud is a shared entity whereby multiple corporations each use a portion of the resources in the cloud. The hardware resources (servers, infrastructure etc.) are managed by the cloud provider. Multiple companies create resources such as virtual machines and virtual networks on the hardware resources.

Incorrect Answers:

A: The public cloud is not owned by the public. In the case of Microsoft Azure, the cloud is owned by Microsoft.

B: The public cloud is a not crowd-sourcing solution. In the case of Microsoft Azure, the cloud is owned by Microsoft.

C: It is not true that public cloud resources can be freely accessed by every member of the public. You pay for a cloud subscription and create accounts for your users to access your cloud resources. No one can access your cloud resources until you create user accounts and provide the appropriate access permissions.

Question: 50 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Azure Site Recovery provides [▼] for virtual machines.

- fault tolerance
- disaster recovery
- elasticity
- high availability

Answer: Azure Site Recovery (ASR): Microsoft's native Disaster Recovery as a Service (DRaaS). It orchestrates replication, failover, and failback of physical servers and virtual machines across regions (Azure-to-Azure) or from on-premises environments (VMware/Hyper-V) to Azure.

When an outage or regional catastrophe occurs, ASR brings workloads back online in a secondary location according to predefined Recovery Time Objectives (RTO) and Recovery Point Objectives (RPO), making it a dedicated disaster recovery service.

Answer Area

Azure Site Recovery provides [▼] for virtual machines.

- fault tolerance
- disaster recovery
- elasticity
- high availability

Explanation:

The answer is Disaster Recovery.

Azure Site Recovery is a disaster recovery service provided by Microsoft Azure, which can be used to protect and recover virtual machines. You can find more information on this service on the Azure website:

https://azure.microsoft.com/en-us/services/site-recovery/ .

Question: 51 CertyIQ

In which type of cloud model are all the hardware resources owned by a third-party and shared between multiple tenants?

A. private
B. hybrid
C. public

Answer: C

Explanation:

Private cloud-taken care by the internal organization to which it belongs

Public cloud-entirely taken care by 3rd party such as Azure, AWS, GCP

Hybrid cloud-combination of on-premises (private)as well as public(3rd party)

Question: 52 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [ ] cloud.

- hybrid
- multi-vendor
- private
- public

Answer:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [hybrid] cloud.

- hybrid
- multi-vendor
- private
- public

Explanation:

hybrid cloud — sometimes called a cloud hybrid — is a computing environment that combines an on-premises datacentre (also called a private cloud) with a public cloud, allowing data and applications to be shared between them. Some people define hybrid cloud to include "multi-cloud" configurations where an organisation uses more than one public cloud in addition to their on-premises datacentre

Reference:

https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 53 CertyIQ

You have 1,000 virtual machines hosted on the Hyper-V hosts in a data center.
You plan to migrate all the virtual machines to an Azure pay-as-you-go subscription.
You need to identify which expenditure model to use for the planned Azure solution.
Which expenditure model should you identify?

A. operational
B. elastic

C. capital

D. scalable

Answer: A

Explanation:

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it). This switch also requires more careful management of your costs. The benefit of the cloud is that you can fundamentally and positively affect the cost of a service you use by merely shutting down or resizing it when it's not needed.

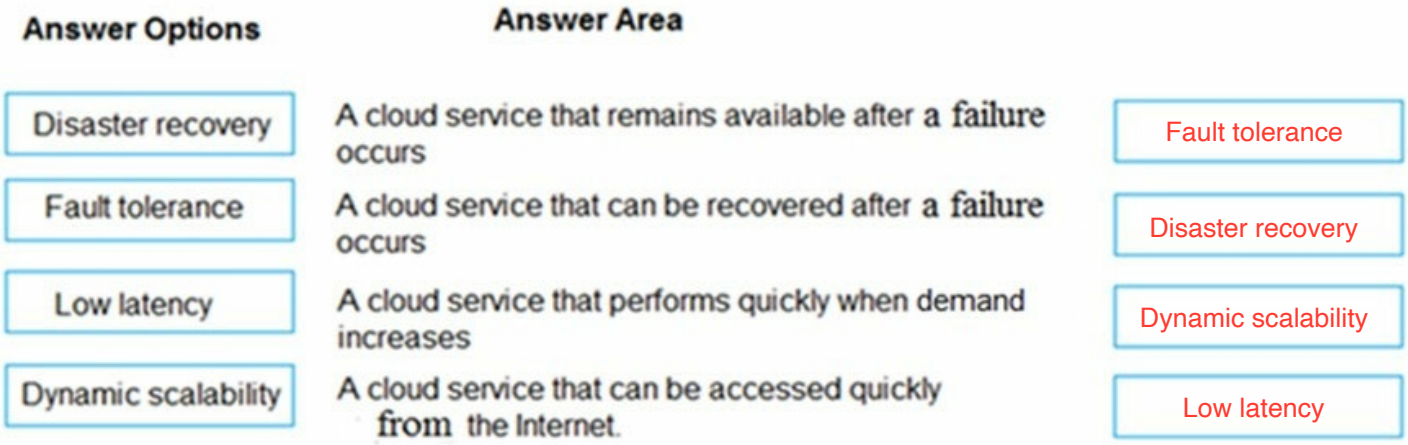
The expenditure models are either CapEx or OpEx (Capital or Operational). CapEx is what you pay upfront, on prem, for servers, racks, cooling, security, the Datacenter itself. OpEx is what you pay to keep your infrastructure operational, like IT staff. In this case, when you move to the Cloud, what you identify in this case is the OpEx or Operational model. This is because you actually don't have CapEx on the Cloud (or at least you look to minimize CapEx) as you pay for the resources you use and not for the underlying hardware, security, cooling, etc that you will pay for in an On-Prem solution. That is why the right answer is (A) Operational. Elastic and Scalable are not expenditure models.

Reference:

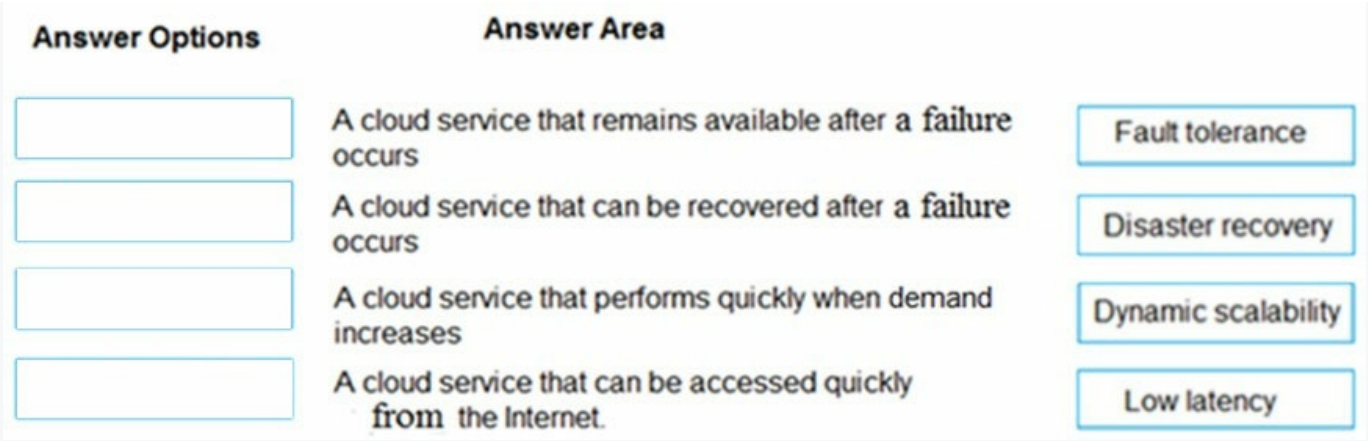
https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold

Question: 54 CertyIQ

DRAG DROP -
Match the Azure services benefits to the correct descriptions.
Instructions: To answer, drag the appropriate benefit from the column on the left to its description on the right.
Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Box 1:

Fault tolerance is the ability of a service to remain available after a failure of one of the components of the service. For example, a service running on multiple servers can withstand the failure of one of the servers.

Box 2:

Disaster recovery is the recovery of a service after a failure. For example, restoring a virtual machine from backup after a virtual machine failure.

Box 3:

Dynamic scalability is the ability for compute resources to be added to a service when the service is under heavy load. For example, in a virtual machine scale set, additional instances of the virtual machine are added when the existing virtual machines are under heavy load.

Box 4:

Latency is the time a service to respond to requests. For example, the time it takes for a web page to be returned from a web server. Low latency means low response time which means a quicker response.

Question: 55

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
To implement a hybrid cloud model, a company must have an internal network.	○	○
A company can extend the computing resources of its internal network by using a hybrid cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
To implement a hybrid cloud model, a company must have an internal network.	○	○
A company can extend the computing resources of its internal network by using a hybrid cloud.	○	○
In a public cloud model, only guest users at your company can access the resources in the cloud.	○	○

Explanation:

Box 1: Yes

Box 2: Yes -

A company can extend the computing resources of its internal network by using the public cloud. This is very common. When you need more resources, rather than pay out for new on-premises infrastructure, you can configure a cloud environment and connect your on-premises network to the cloud environment by using a VPN.

Box 3: No -

It is not true that only guest users can access cloud resources. You can give anyone with an account in Azure Active Directory access to the cloud resources.

There are many authentication scenarios but a common one is to replicate your on-premises Active Directory accounts to Azure Active Directory and provide access to the Azure Active Directory accounts. Another commonly used authentication method is 'Federation' where authentication for access to cloud resources is passed to another authentication provider such as an on-premises Active Directory.

Question: 56 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A Platform as a Service (PaaS) solution provides full control of operating systems that host applications.	○	○
A Platform as a Service (PaaS) solution provides additional memory to apps by changing pricing tiers.	○	○
A Platform as a Service (PaaS) solution can automatically scale the number of instances.	○	○

Answer:

Answer Area

Statements	Yes	No
A Platform as a Service (PaaS) solution provides full control of operating systems that host applications.	○	○
A Platform as a Service (PaaS) solution provides additional memory to apps by changing pricing tiers.	○	○
A Platform as a Service (PaaS) solution can automatically scale the number of instances.	○	○

Explanation:

No

Yes

Yes

(PaaS) solution DOES NOT provide full control of operating systems that host applications.

(PaaS) solution provides additional memory to apps by changing pricing tiers.

(PaaS) solution can automatically scale the number of intances.

Question: 57 CertyIQ

Your company has an on-premises network that contains multiple servers.
The company plans to reduce the following administrative responsibilities:
- Backing up application data
- Replacing failed server hardware
- Managing physical server security
- Updating server operating systems
- Managing permissions to shared documents

The company plans to migrate servers to Azure virtual machines.
You need to identify which administrative responsibilities will be eliminated after the planned migration.
Which two responsibilities should you identify? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Replacing failed server hardware
B. Backing up application data
C. Managing physical server security
D. Updating server operating systems
E. Managing permissions to shared documents

Answer: AC

Explanation:
Azure virtual machines run on Hyper-V physical servers. The physical servers are owned and managed by Microsoft. As an Azure customer, you have no access to the physical servers. Microsoft manage the replacement of failed server hardware and the security of the physical servers so you don't need to.
Incorrect Answers:
B: Microsoft have no control over the applications you run on the virtual machines. Therefore, it is your responsibility to ensure that application data is backed up.
D: Microsoft do not manage the operating systems you run on the virtual machines. Therefore, it is your responsibility to ensure that the operating systems are updated.
E: Microsoft have no control over the shared folders you host on the virtual machines. Therefore, it is your responsibility to ensure that folder permissions are configured appropriately.

Question: 58 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Pay-As-You-Go pricing is an example of CapEx.	○	○
Paying electricity for your datacenter is an example of OpEx.	○	○
Deploying your own datacenter is an example of CapEx.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Pay-As-You-Go pricing is an example of CapEx.	○	○
Paying electricity for your datacenter is an example of OpEx.	○	○
Deploying your own datacenter is an example of CapEx.	○	○

Explanation:

One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it).

Box 1: No -

With the pay-as-go model, you pay for services as you use them. This is Opex (Operational Expenditure), not CapEx (Captial Expenditure). CapEx is where you pay for something upfront. For example, buying a new physical server.

Box 2: No -

Paying for electricity for your own datacenter will be classed as CapEx, not OpEx.

Box 3: Yes -

Deploying your own datacenter is an example of CapEx. This is because you need to purchase all the infrastructure upfront before you can use it.

Reference:

https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold

Question: 59 CertyIQ

You plan to provision Infrastructure as a Service (IaaS) resources in Azure.
Which resource is an example of IaaS?

A. an Azure web app
B. an Azure virtual machine
C. an Azure logic app
D. an Azure SQL database

Answer:

B

Explanation:

An Azure virtual machine is an example of Infrastructure as a Service (IaaS).

Azure web app, Azure logic app and Azure SQL database are all examples of Platform as a Service (Paas).

Reference:

https://azure.microsoft.com/en-gb/overview/what-is-iaas/

https://azure.microsoft.com/en-gb/overview/what-is-paas/

Question: 60 CertyIQ

To which cloud models can you deploy physical servers?

A. private cloud and hybrid cloud only

B. private cloud only

C. private cloud, hybrid cloud and public cloud

D. hybrid cloud only

In a public cloud, all physical hardware and servers are owned, deployed, and managed exclusively by the cloud provider (Microsoft). The customer has no ability or authorization to physically provision, install, or rack bare-metal physical servers.

In a private cloud, an organization owns or controls the dedicated physical infrastructure, meaning the organization itself purchases, racks, and deploys physical host servers into the environment.

Answer: A

Explanation:

In a hybrid cloud, the architecture combines public cloud services with an organization's on-premises/private infrastructure. Because the organization manages and maintains the on-premises private footprint of the hybrid architecture, it can deploy physical servers to that portion of the environment

A private cloud is on-premises so you can deploy physical servers.

A hybrid cloud is a mix of on-premise and public cloud resources. You can deploy physical servers on-premises.

Reference:

https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 61 CertyIQ

DRAG DROP -
Match the cloud model to the correct advantage.
Instructions: To answer, drag the appropriate cloud model from the column on the left to its advantage on the right. Each cloud model may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point
Select and Place:

Public Cloud (No required capital expenditure): In a pure public cloud model, organizations do not purchase physical hardware, servers, or datacenter infrastructure. Instead, all compute and storage are rented on a consumption basis (Operational Expenditure / OpEx), completely eliminating mandatory CapEx.

Private Cloud (Provides complete control over security): Because hardware, networking, physical facilities, and hypervisors are dedicated entirely to a single organization, the company retains absolute control over physical security, network perimeter configuration, regulatory compliance, and system hardening.

Cloud model	Work Area	
Hybrid Cloud	Public Cloud	No required capital expenditure.
Private Cloud	Private Cloud	Provides complete control over security.
Public Cloud	Hybrid Cloud	Provides a choice to use on-premises or cloud-based resources.

Hybrid Cloud (Provides a choice to use on-premises or cloud-based resources): A hybrid environment integrates on-premises private infrastructure with public cloud services, offering the flexibility to choose where specific workloads or datasets reside (e.g., highly sensitive legacy databases stay on-premises, while elastic web apps run in the public cloud).

Answer:

Cloud model	Work Area	
Hybrid Cloud	Public Cloud	No required capital expenditure.
Private Cloud	Private Cloud	Provides complete control over security.
Public Cloud	Hybrid Cloud	Provides a choice to use on-premises or cloud-based resources.

Explanation:

Box 1: Public Cloud -

With a public cloud, there is no capital expenditure on server hardware etc. You only pay for cloud resources that you use as you use them.

Box 2: Private Cloud -

A private cloud exists on premises, so you have complete control over security.

Box 3: Hybrid Cloud -

A hybrid cloud is a mix of public cloud resources and on-premises resources. Therefore, you have a choice to use either.

Question: 62

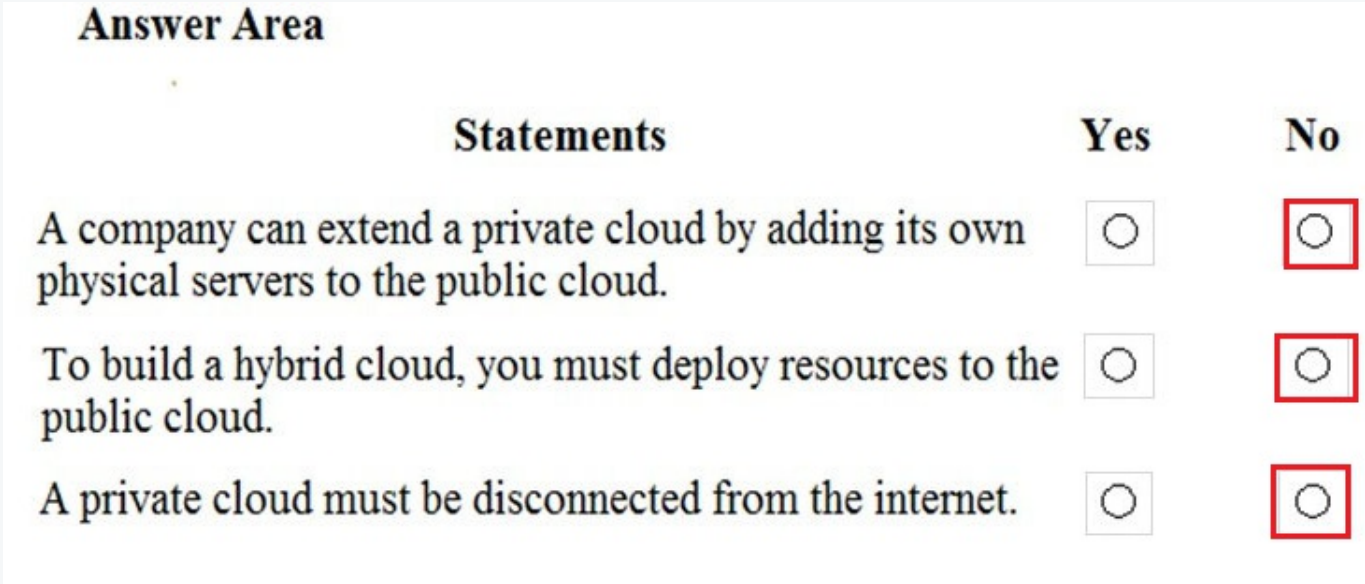
CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A company can extend a private cloud by adding its own physical servers to the public cloud.	○	○
To build a hybrid cloud, you must deploy resources to the public cloud.	○	○
A private cloud must be disconnected from the internet.	○	○

Answer:



Explanation:

Box 1: No .

You cannot add physical servers to the public cloud. You can only deploy virtual servers in the public cloud. You can extend a private cloud by deploying virtual servers in a public cloud. This would create a hybrid cloud.

Box 2: No.

Box 3: No.

It is not true that a private cloud must be disconnected from the Internet. Private clouds can be and most commonly are connected to the Internet. Private cloud means that the physical servers are managed by you. It does not mean that it is disconnected from the Internet.

Question: 63 CertyIQ

You have 50 virtual machines hosted on-premises and 50 virtual machines hosted in Azure. The on-premises virtual machines and the Azure virtual machines connect to each other.
Which type of cloud model is this?

A. hybrid
B. private
C. public

Answer: A

Explanation:

The correct answer is A. hybrid.

A hybrid cloud model combines an organization's internal infrastructure (a private cloud or on-premises data center) with a public cloud provider's infrastructure (such as Microsoft Azure, AWS, or Google Cloud), allowing data and applications to be shared and communicate between them.

References:

https://azure.microsoft.com/en-gb/overview/what-is-hybrid-cloud-computing/

Question: 64 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	○
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be provided with additional memory by changing the pricing tier.	○	○
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be configured to automatically scale the number of instances based on demand.	○	○

Answer:

Answer Area

Statements	Yes	No
A platform as a service (PaaS) solution that hosts web apps in Azure provides full control of the operating systems that host applications.	○	●
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be provided with additional memory by changing the pricing tier.	●	○
A Platform as a Service (PaaS) solution that hosts web apps in Azure can be configured to automatically scale the number of instances based on demand.	●	○

Explanation:
Box 1: No -
A PaaS solution does not provide access to the operating system. The Azure Web Apps service provides an environment for you to host your web applications.
Behind the scenes, the web apps are hosted on virtual machines running IIS. However, you have no direct access to the virtual machine, the operating system or
IIS.

Box 2: Yes -

Box 3: Yes -
A PaaS solution that hosts web apps in Azure does provide the ability to scale the platform automatically. This is known as autoscaling. Behind the scenes, the web apps are hosted on virtual machines running IIS. Autoscaling means adding more load balanced virtual machines to host the web apps.

Reference:
https://azure.microsoft.com/en-gb/overview/what-is-paas/

Question: 65 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not

appear in the review screen.
Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company migration plan.
Solution: You create Azure virtual machines, Azure SQL databases, and Azure Storage accounts.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

Platform as a service (PaaS) is a complete development and deployment environment in the cloud. PaaS includes infrastructure " servers, storage, and networking " but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the complete web application lifecycle: building, testing, deploying, managing, and updating.

However, virtual machines are examples of Infrastructure as a service (IaaS). IaaS is an instant computing infrastructure, provisioned and managed over the internet.

References:

https://azure.microsoft.com/en-us/overview/what-is-paas/

https://azure.microsoft.com/en-us/overview/what-is-iaas/

Question: 66 CertyIQ

Your company plans to deploy several custom applications to Azure. The applications will provide invoicing services to the customers of the company. Each application will have several prerequisite applications and services installed.
You need to recommend a cloud deployment solution for all the applications.
What should you recommend?

A. Software as a Service (SaaS)
B. Platform as a Service (PaaS)
C. Infrastructure as a Service (IaaS)

Answer: C

Explanation:
Infrastructure as a service (IaaS) is an instant computing infrastructure, provisioned and managed over the internet. The IaaS service provider manages the infrastructure, while you purchase, install, configure, and manage your own software
Incorrect Answers:
A: Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring, and office tools. In this scenario, you need to run your own apps, and therefore require an infrastructure.
B:
Platform as a service (PaaS) is a complete development and deployment environment in the cloud. PaaS includes infrastructure"servers, storage, and networking"but also middleware, development tools, business intelligence (BI) services, database management systems, and more. PaaS is designed to support the

complete web application lifecycle: building, testing, deploying, managing, and updating.

Question: 67 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Building a data center infrastructure is an example of operational expenditure (OpEx) costs.	○	○
Monthly salaries for technical personnel are an example of operational expenditure (OpEx) costs.	○	○
Leasing software is an example of operational expenditure (OpEx) costs.	○	○

Answer:

Answer Area

Statements	Yes	No
Building a data center infrastructure is an example of operational expenditure (OpEx) costs.	○	○
Monthly salaries for technical personnel are an example of operational expenditure (OpEx) costs.	○	○
Leasing software is an example of operational expenditure (OpEx) costs.	○	○

Explanation:

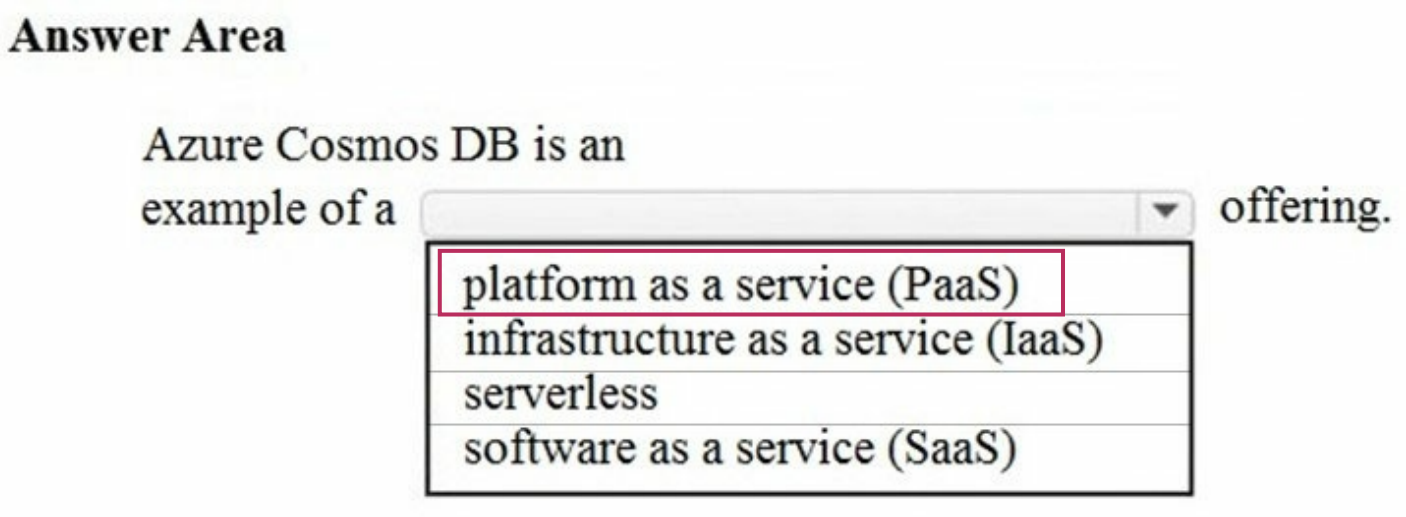
Box 1: No -
Building a data center infrastructure is capital expenditure, not operation expenditure.

Box 2: Yes -
OpEx is ongoing costs (costs of operations) such as staff salaries.

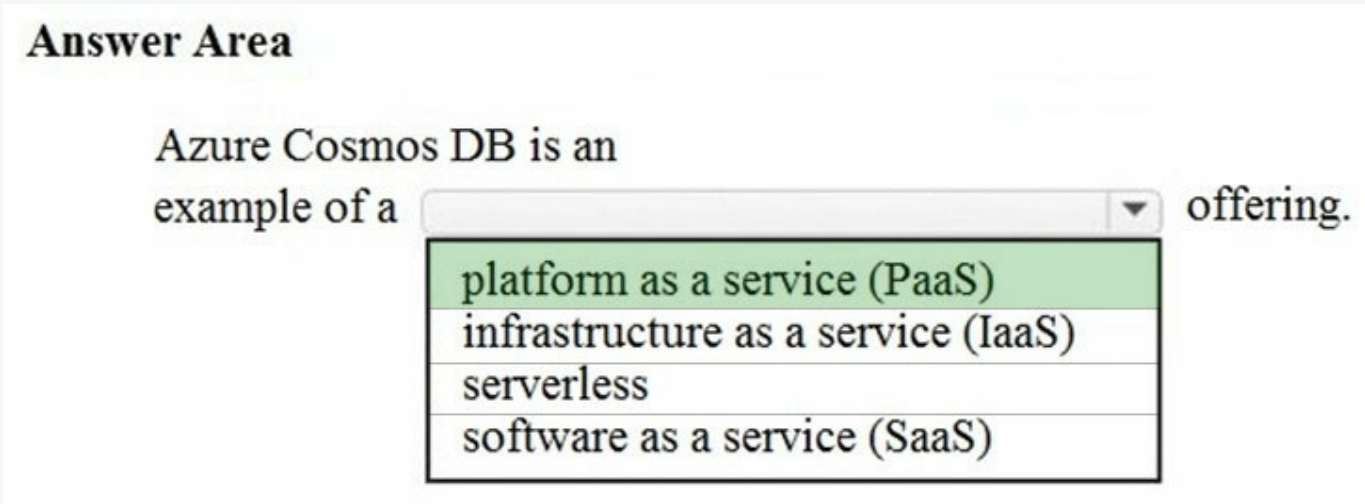
Box 2: Yes -
OpEx is ongoing costs (costs of operations) such as leasing software. If you purchased software as a one-off purchase, that would be CapEx, but leasing software is ongoing so it's OpEx.

Question: 68 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



Explanation:
Azure Cosmos DB is an example of a platform as a service (PaaS) cloud database provider.

Reference:

Answer Area

Statements	Yes	No
With software as a service (SaaS), you must apply software updates.	○	○
With infrastructure as a service (IaaS), you must install the software that you want to use.	○	○
Azure Backup is an example of platform as a service (PaaS).	○	○

Answer:

Answer Area

Statements	Yes	No
With software as a service (SaaS), you must apply software updates.	○	○
With infrastructure as a service (IaaS), you must install the software that you want to use.	○	○
Azure Backup is an example of platform as a service (PaaS).	○	○

Explanation:

Statement 1: With software as a service (SaaS), you must apply software updates.

Answer: No

Explanation: In a SaaS model (like Microsoft 365, Salesforce, or Gmail), the cloud provider manages the entire application stack. This includes hardware, virtualization, operating systems, and the application software itself. The vendor automatically handles all software updates, feature upgrades, and bug patches behind the scenes without any effort or intervention from the end user.

Statement 2: With infrastructure as a service (IaaS), you must install the software that you want to use.

Answer: Yes

Explanation: IaaS provides the rawest form of cloud computing resources — typically virtual machines, storage, and networking. While the cloud provider manages the physical data center hardware and hypervisor, you are given full administrative control over the operating system. This means you are completely responsible for installing, configuring, and maintaining any software, runtimes, middleware, or applications you intend to run.

Statement 3: Azure Backup is an example of platform as a service (PaaS).

Answer: Yes

Explanation: PaaS provides a managed environment where you can deploy applications or consume services

without the complexity of managing the underlying operating systems, VMs, or hardware infrastructure. Azure Backup is a fully managed, serverless backup-as-a-service solution. You do not need to provision storage servers, install backup software, or patch an OS to use it; you simply configure your backup policies and let Azure handle the underlying execution, which classifies it perfectly under the PaaS umbrella.

https://azure.microsoft.com/en-us/overview/what-is-iaas/

https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 70

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can create a resource group inside of another resource group.	○	○
An Azure virtual machine can be in multiple resource groups.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Answer:

Answer Area

Statements	Yes	No
You can create a resource group inside of another resource group.	○	○
An Azure virtual machine can be in multiple resource groups.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Explanation:

Box 1: No -

Box 2: No -

Each resource can exist in only one resource group.

Box 3: Yes -

Resources from multiple different regions can be placed in a resource group. The resource group only contains metadata about the resources it contains.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview
https://www.codeisahighway.com/effective-ways-to-delete-resources-in-a-resource-group-on-azure/

Question: 71 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Answer Area

Statements	Yes	No
Microsoft SQL Server 2019 installed on an Azure virtual machine is an example of platform as a service (PaaS).	○	○
Azure SQL Database is an example of platform as a service (PaaS).	○	○
Azure Cosmos DB is an example of software as a service (SaaS).	○	○

Answer:

Answer Area

Statements	Yes	No
Microsoft SQL Server 2019 installed on an Azure virtual machine is an example of platform as a service (PaaS).	○	○
Azure SQL Database is an example of platform as a service (PaaS).	○	○
Azure Cosmos DB is an example of software as a service (SaaS).	○	○

Explanation:

Statement 1: Microsoft SQL Server 2019 installed on an Azure virtual machine is an example of platform as a service (PaaS).

Answer: No

Explanation: When you deploy an Azure Virtual Machine and install SQL Server on it, you are leveraging Infrastructure as a Service (IaaS). You are responsible for managing the underlying operating system, configuring the SQL Server installation, managing storage disks, and applying both OS patches and database cumulative updates.

Statement 2: Azure SQL Database is an example of platform as a service (PaaS).

Answer: Yes

Explanation: Azure SQL Database is a fully managed relational database engine. Azure handles all core infrastructure management, including hardware provisioning, operating system patching, database software updates, backups, and high availability configurations. You only manage your schemas, data, and access permissions, which fits the definition of PaaS.

Statement 3: Azure Cosmos DB is an example of software as a service (SaaS).

Answer: No

Explanation: Azure Cosmos DB is a fully managed NoSQL and relational database service designed for

modern app development, which classifies it as a Platform as a Service (PaaS). It is a building block for developers to build applications upon. SaaS, by contrast, refers to end-user applications delivered over the web (such as Microsoft 365, Salesforce, or Microsoft Dynamics 365) where the end-user interacts with a complete software interface rather than a database engine.

Reference:

https://docs.microsoft.com/en-us/azure/azure-sql/azure-sql-iaas-vs-paas-what-is-overview https://docs.microsoft.com/en-us/azure/cosmos-db/account-databases-containers-items https://www.red-gate.com/simple-talk/cloud/azure/overview-of-azure-cosmos-db

Question: 72 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:
Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [ ]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Answer:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [ ]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Explanation:

Managed by Azure is the key, so, is a PaaS

Reference:

https://docs.microsoft.com/en-us/azure/azure-sql/azure-sql-iaas-vs-paas-what-is-overview

Question: 73 CertyIQ

Your company plans to migrate all its data and resources to Azure.
The company's migration plan states that only Platform as a Service (PaaS) solutions must be used in Azure.
You need to deploy an Azure environment that meets the company's migration plan.
What should you create?

A. Azure virtual machines, Azure SQL databases, and Azure Storage accounts.
B. an Azure App Service and Azure virtual machines that have Microsoft SQL Server installed.
C. an Azure App Service and Azure SQL databases.
D. Azure storage accounts and web server in Azure virtual machines.

Answer: C

Explanation:
Azure App Service and Azure SQL databases are examples of Azure PaaS solutions. Therefore, this solution does meet the goal.

Question: 74 CertyIQ

What does a customer provide in a software as a service (SaaS) model?

A. application data
B. data storage
C. compute resources
D. application software

Answer: A

Explanation:
SaaS provides a complete software solution which you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization and your users connect to it over the Internet, usually with a web browser. All of the underlying infrastructure, middleware, app software and app data are located in the service provider's data center. The service provider manages the hardware and software and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well.

Reference:
https://azure.microsoft.com/en-in/overview/what-is-saas/

Question: 75 CertyIQ

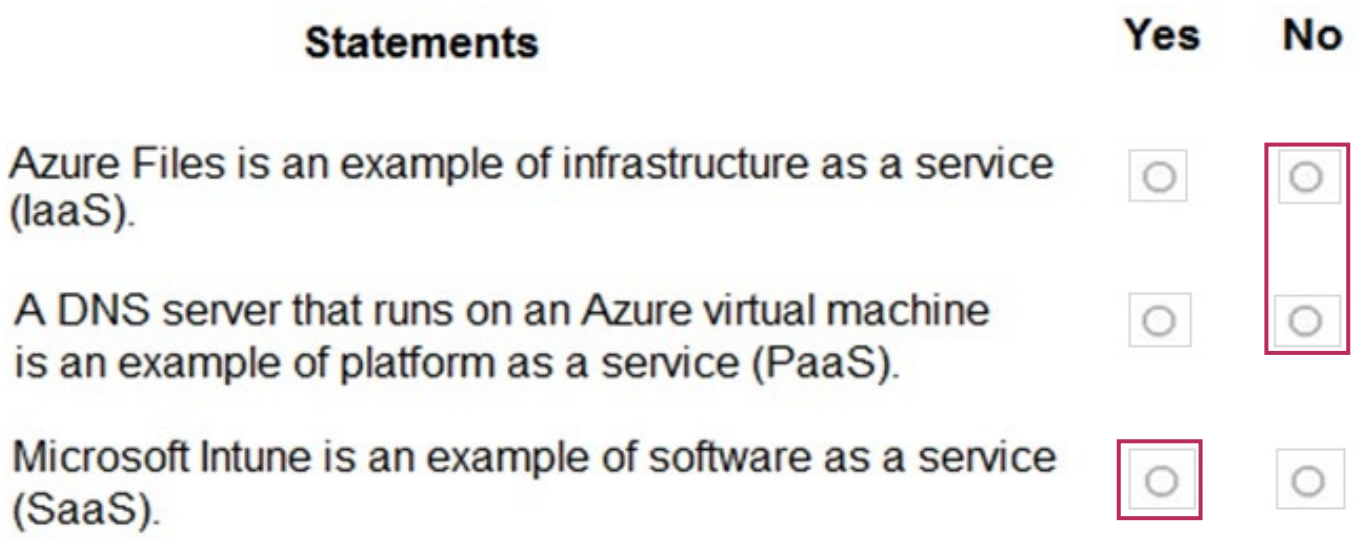
HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (Azure Files = PaaS): Azure Files provides fully managed serverless file shares in the cloud accessible via SMB or NFS protocols. Because Microsoft manages all hardware, server infrastructure, OS, and maintenance without requiring you to manage underlying virtual machines, it falls under Platform as a Service (PaaS).

Statement 2 (DNS on a VM = IaaS): Installing and running services or server roles (such as a DNS server) directly inside an Azure Virtual Machine places the operating system, server software, patching, and configuration under the customer's control, which defines Infrastructure as a Service (IaaS). (Note: Azure DNS, the managed DNS hosting service, is PaaS, but running DNS software on a VM is IaaS).

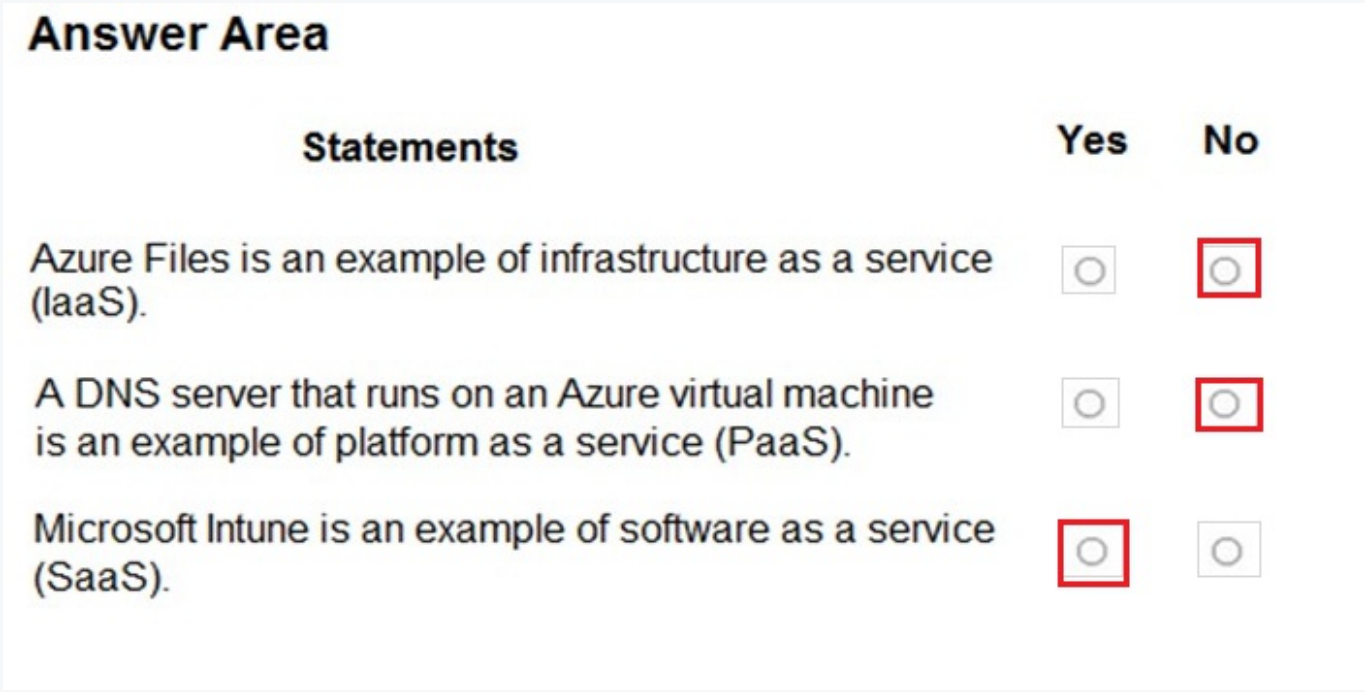
Statement 3 (Microsoft Intune = SaaS): Microsoft Intune is a cloud-based unified endpoint management (UEM) solution that is consumed directly via the web/admin center without the customer managing any servers, runtimes, or underlying application layers, categorizing it as Software as a Service (SaaS).

Answer Area



Answer:

Answer Area



Explanation:

1.) Azure Files is an example of infrastructure as a service (IaaS).

Answer: **No.** Azure Files is actually a managed file storage service, which is considered a part of Platform as a Service (PaaS).

2.) A DNS server that runs on an Azure virtual machine is an example of platform as a service (PaaS).

Answer: **No.** A DNS server running on an Azure virtual machine would be considered Infrastructure as a Service (IaaS) because it involves managing the underlying infrastructure.

3.) Microsoft Intune is an example of software as a service (SaaS).

Answer: **Yes.** Microsoft Intune is indeed a Software as a Service (SaaS) as it provides software over the internet without needing local installation.

Question: 76 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Cloud computing provides elastic scalability.	○	○
Customers can minimize capital expenditure (CapEx) by using a public cloud.	○	○
Cloud computing leverages virtualization to provide services to multiple customers simultaneously.	○	○

Answer:

Answer Area

Statements	Yes	No
Cloud computing provides elastic scalability.	○	○
Customers can minimize capital expenditure (CapEx) by using a public cloud.	○	○
Cloud computing leverages virtualization to provide services to multiple customers simultaneously.	○	○

Explanation:

Cloud computing provides elastic scalability: Yes. "Elasticity" means the system can automatically add or remove resources (like server power or storage) instantly to match your current needs.Customers can minimize capital expenditure (CapEx) by using a public cloud: Yes. Instead of buying expensive hardware upfront (CapEx), you pay for what you use as an ongoing operating expense (OpEx).Cloud computing leverages virtualization to provide services to multiple customers simultaneously: Yes. Virtualization allows a single physical server to be divided into multiple "virtual" environments, enabling providers to serve many customers at once using the same hardware.

Question: 77 CertyIQ

What is the first stage in the Microsoft Cloud Adoption Framework for Azure?

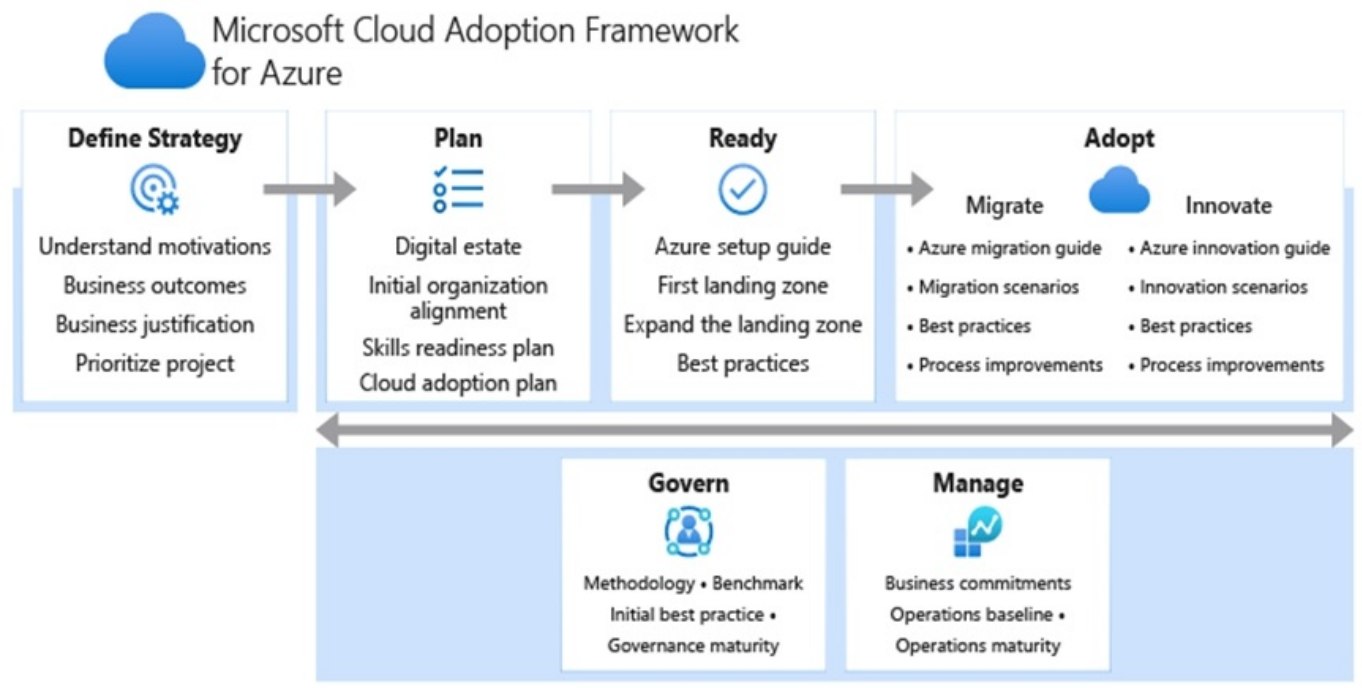
A. Adopt the cloud.
B. Make a plan.

C. Ready your organization.

D. Define your strategy.

Answer: D

Explanation:



Reference:
https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/overview

Question: 78

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A company can extend an internal network by adding its own physical servers to the public cloud.	○	○
A private cloud must be disconnected from the internet.	○	○
Part of a hybrid cloud is the public cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
A company can extend an internal network by adding its own physical servers to the public cloud.	○	●
A private cloud must be disconnected from the internet.	○	●
Part of a hybrid cloud is the public cloud.	●	○

Explanation:
Box 1: No -
You cannot add physical servers to the public cloud. You can only deploy virtual servers in the public cloud.
You can extend a private cloud by deploying virtual servers in a public cloud. This would create a hybrid cloud.

Box 2: No -
A private cloud exists in cyberspace and is accessed via the internet.
Box 3: Yes.

Reference:
https://azure.microsoft.com/en-gb/overview/what-are-private-public-hybrid-clouds/

Question: 79 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You must have physical servers to use cloud computing.	○	●
You must have internet connectivity to use cloud computing.	●	○
The costs to increase cloud computing capacity are less than the costs to increase the computing capacity of an on-premises datacenter.	●	○

Answer:

Answer Area

Statements	Yes	No
You must have physical servers to use cloud computing.	○	○
You must have internet connectivity to use cloud computing.	○	○
The costs to increase cloud computing capacity are less than the costs to increase the computing capacity of an on-premises datacenter.	○	○

Explanation:
Box 1: No -
Virtual Machines works.

Box 2: Yes -
Simply put, cloud computing is the delivery of computing services"including servers, storage, databases, networking, software, analytics, and intelligence"over the Internet (the cloud) to offer faster innovation, flexible resources, and economies of scale.

Box 3: Yes -

Reference:
https://azure.microsoft.com/en-us/overview/what-is-cloud-computing/

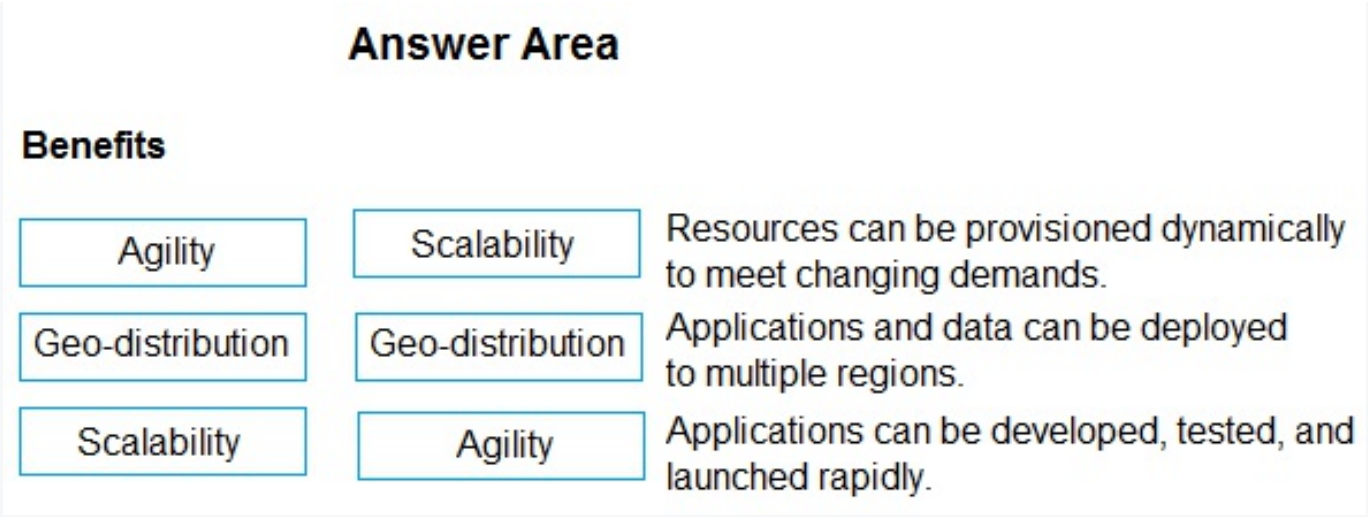
Question: 80 CertyIQ

DRAG DROP -
Match the cloud computing benefits to the correct descriptions.
To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer Area

Benefits		
Agility	Scalability	Resources can be provisioned dynamically to meet changing demands.
Geo-distribution	Geo Distribution	Applications and data can be deployed to multiple regions.
Scalability	Agility	Applications can be developed, tested, and launched rapidly.

Answer:



Explanation:

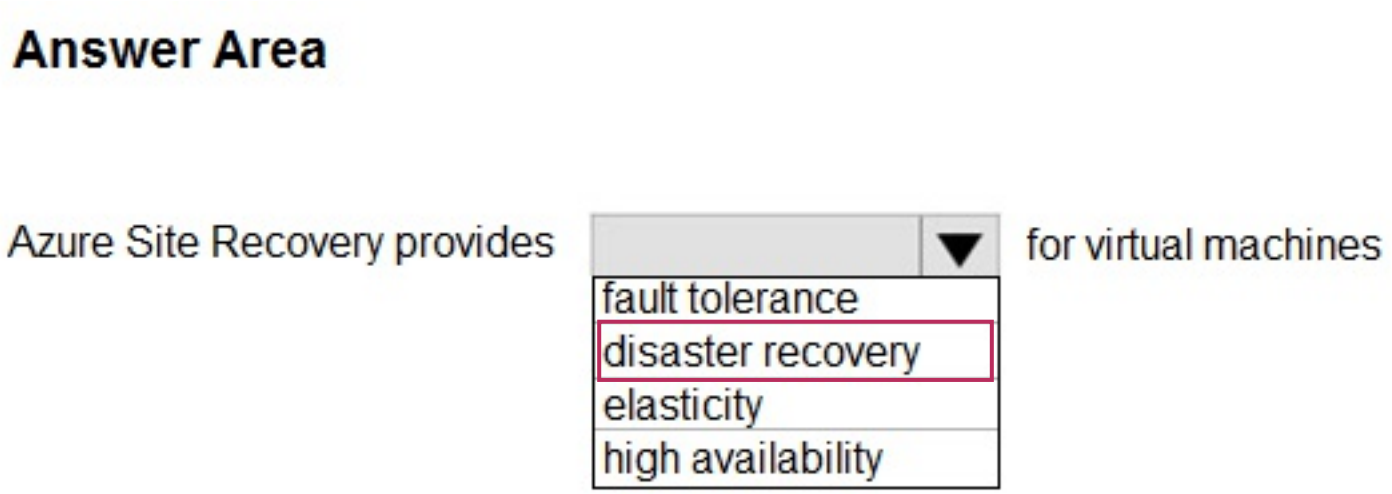
1. Scalability $\rightarrow$ Resources can be provisioned dynamically to meet changing demands. Scalability refers to a system's capacity to handle growing or shrinking workloads by adjusting its resource footprint.Key Context: This can happen horizontally (adding or removing instances, like adding more virtual machines to a cluster) or vertically (upgrading or downgrading an existing instance's power, like increasing memory or CPU). It ensures that your underlying infrastructure matches your operational demands perfectly.

2. Geo-distribution $\rightarrow$ Applications and data can be deployed to multiple regions. Geo-distribution is the practice of running application instances and replicating data stores across distinct physical data center locations globally.Key Context: This provides two major advantages: it ensures regional redundancy (if an entire geographic area suffers an extreme weather event or infrastructure outage, traffic routes to another region), and it drastically reduces network latency for global end-users by serving content from a data center physically closest to them.

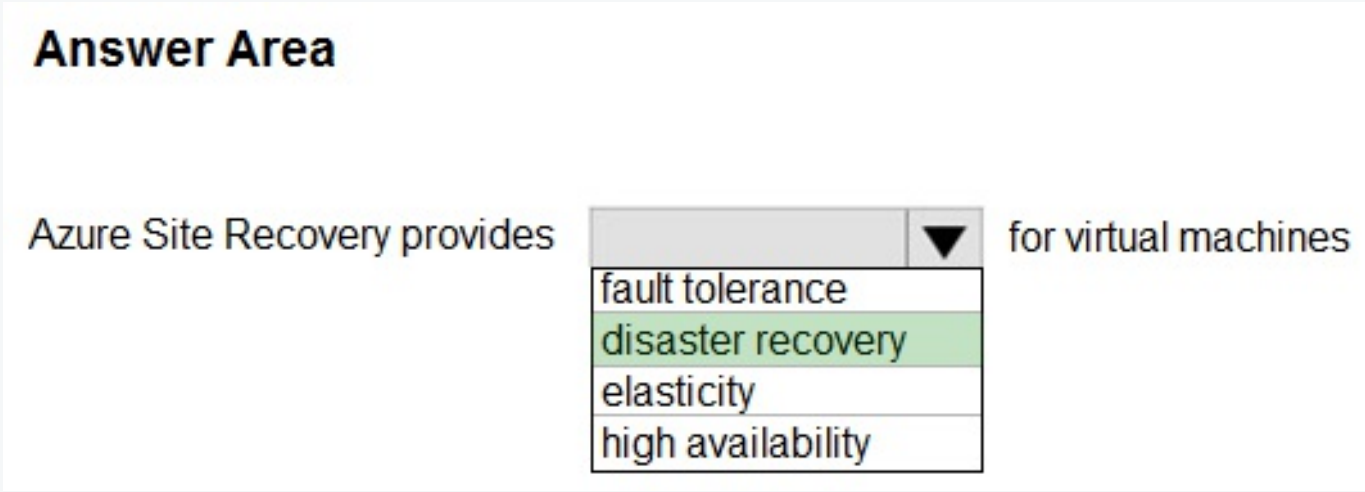
3. Agility $\rightarrow$ Applications can be developed, tested, and launched rapidly. Agility describes the operational speed, organizational flexibility, and reduced time-to-market achieved by shifting workloads to a cloud environment.Key Context: Because developers do not have to wait for procurement teams to order, ship, and rack physical server hardware, they can provision entire dev/test infrastructure environments via code or portal menus in minutes. This drastically accelerates software deployment lifecycles and allows companies to iterate quickly on new features.

Question: 81 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:

You set up disaster recovery for Azure VMs using Azure Site Recovery.

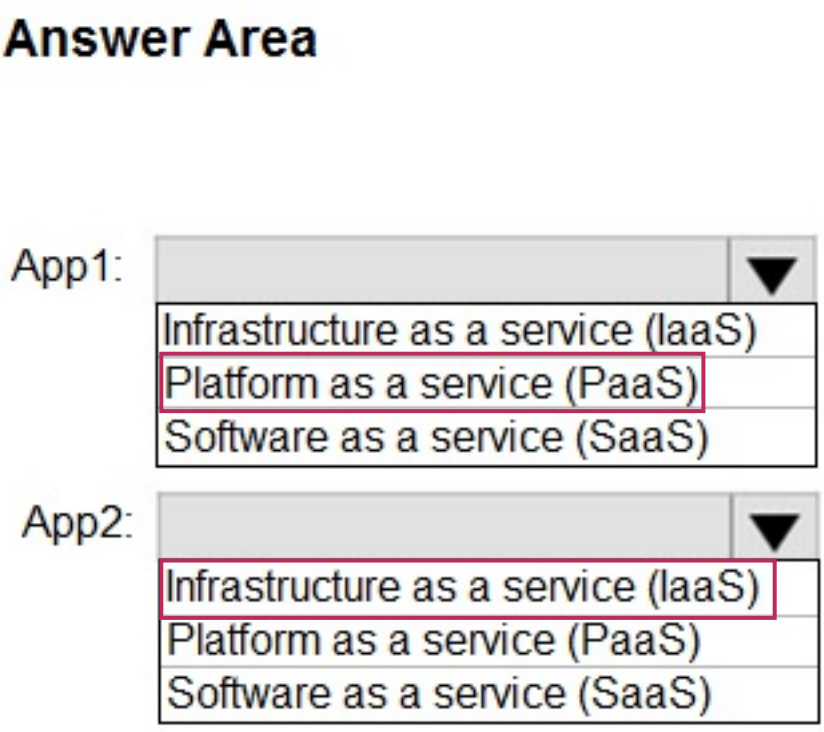
Reference:

https://docs.microsoft.com/en-us/azure/site-recovery/azure-to-azure-tutorial-enable-replication

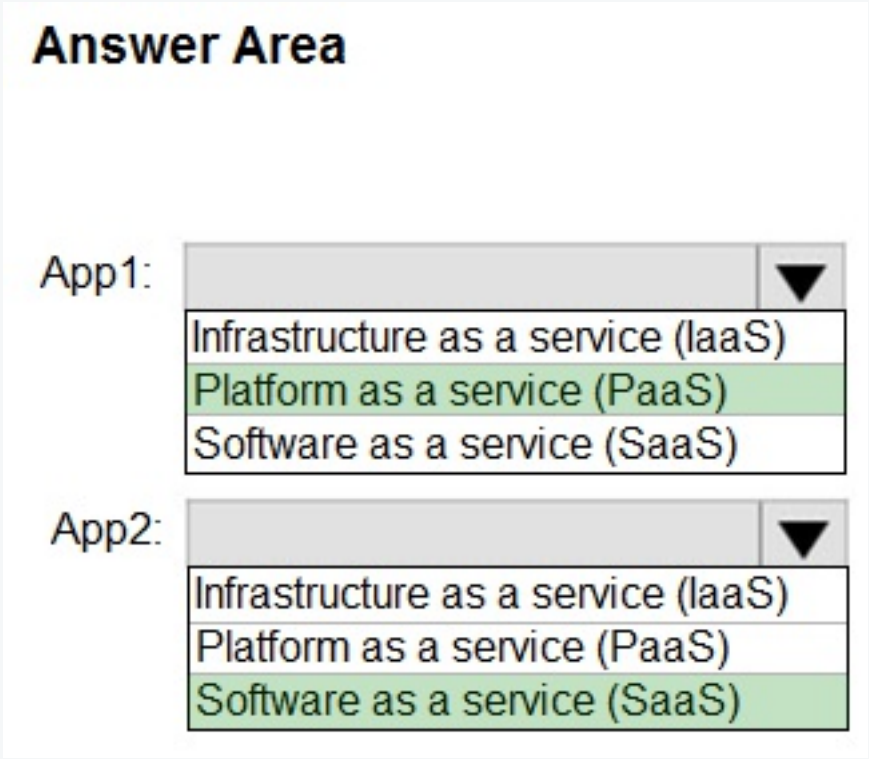
Question: 82 CertyIQ

HOTSPOT -
You plan to use Azure to host two apps named App1 and App2. The apps must meet the following requirements:
- You must be able to modify the code of App1.
- Administrative effort to manage the operating system of App1 must be minimized.
- App2 must run interactively with the operating system of the server.

Which type of cloud service should you use for each app? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:



Answer:

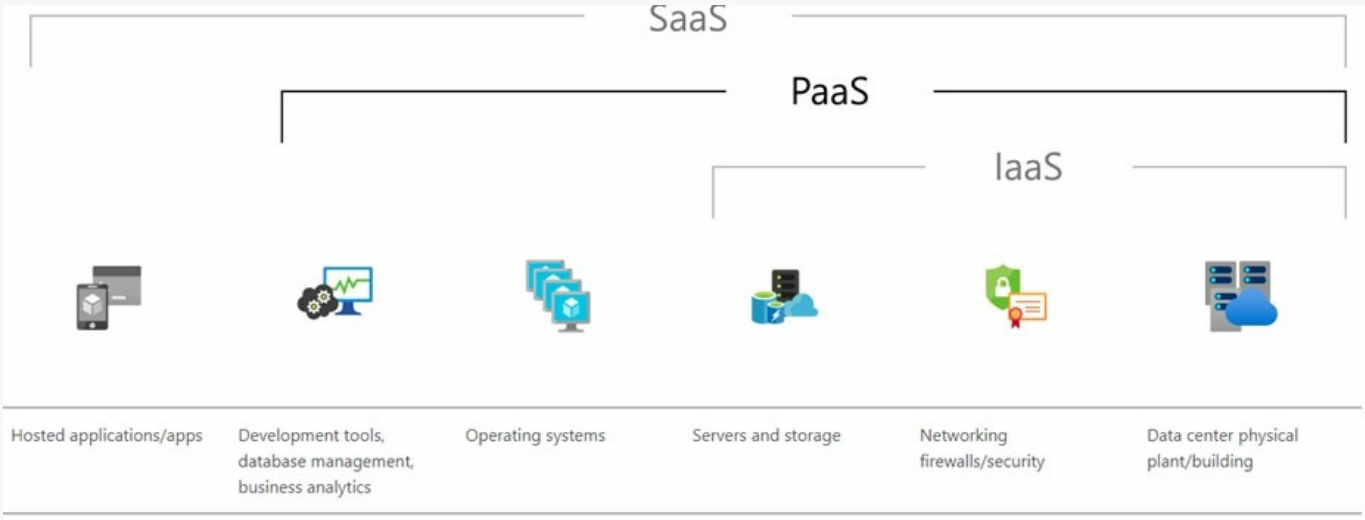


Explanation:

Box 1: Azure Platform as a service (PaaS)

Organizations typically use PaaS for these scenarios:

Development framework. PaaS provides a framework that developers can build upon to develop or customize cloud-based applications. Similar to the way you create an Excel macro, PaaS lets developers create applications using built-in software components. Cloud features such as scalability, high-availability, and multi-tenant capability are included, reducing the amount of coding that developers must do.



Box 2:

Software as a service (SaaS) allows users to connect to and use cloud-based apps over the Internet. Common examples are email, calendaring, and office tools

(such as Microsoft Office 365).

SaaS provides a complete software solution that you purchase on a pay-as-you-go basis from a cloud service provider. You rent the use of an app for your organization, and your users connect to it over the Internet,

usually with a web browser. All of the underlying infrastructure, middleware, app software, and app data are located in the service provider's data center. The service provider manages the hardware and software, and with the appropriate service agreement, will ensure the availability and the security of the app and your data as well. SaaS allows your organization to get quickly up and running with an app at minimal upfront cost.

Reference:

https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 83 CertyIQ

You have an accounting application named App1 that uses a legacy database.
You plan to move App1 to the cloud.
Which service model should you use?

A. platform as a service (PaaS)
B. infrastructure as a service (IaaS)
C. software as a service (SaaS)

IaaS (Infrastructure as a Service) provides virtual machines, networking, and virtual storage with full operating system access and administrative control.

Because legacy software often depends on specific OS versions, deprecated frameworks, local file paths, or custom legacy database engines that are not supported in managed environments, it requires an IaaS deployment (e.g., Azure VMs) to run without significant architectural refactoring.

Answer: B

Explanation:

IaaS as you need to install the legacy software.

Cloud Infrastructure-based Applications " It moves your existing on-premises apps to the Infrastructure as a Service (IaaS) platform or re-hosts them. Lift & Shift is a common term for this type of relocation. The programs will be nearly identical to what they were before, but they will now be able to run on cloud VMs.

Reference:

https://techtaalk.com/microsoft-azure-for-legacy-application-modernization/

Question: 84 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability
- defining scalability rules
- installing the SaaS solution
- configuring the SaaS solution

Answer:

Answer Area

When you are implementing a Software as a Service (SaaS) solution, you are responsible for

- configuring high availability
- defining scalability rules
- installing the SaaS solution
- configuring the SaaS solution

Explanation:
Box: configuring the Saas Solution
Software as a service (or SaaS) is a way of delivering applications over the Internet"as a service. Instead of installing and maintaining software, you simply access it via the Internet, freeing yourself from complex software and hardware management.
SaaS applications are sometimes called Web-based software, on-demand software, or hosted software. Whatever the name, SaaS applications run on a SaaS provider's servers. The provider manages access to the application, including security, availability, and performance.

Reference:
https://www.salesforce.com/in/saas/

Question: 85 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [ ] cloud.

- hybrid
- multi-vendor
- private
- public

Answer:

Answer Area

An Azure web app that queries an on-premises Microsoft SQL server is an example of a [hybrid] cloud.

- hybrid
- multi-vendor
- private
- public

Explanation:
Box: hybrid -
You can deploy hybrid app with on-premises data that scales cross-cloud.

Reference:
https://docs.microsoft.com/en-us/azure/architecture/hybrid/deployments/solution-deployment-guide-cross-

cloud-scaling-onprem-data

Question: 86 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [▼]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Answer:

Answer Area

A Microsoft SQL Server database that is hosted in the cloud and has software updates managed by Azure is an example of [▼]
- disaster recovery as a service (DRaaS).
- infrastructure as a service (IaaS).
- platform as a service (PaaS).
- software as a service (SaaS).

Explanation:
Box: Platform as a service (PaaS)
Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications. You purchase the resources you need from a cloud service provider on a pay- as-you-go basis and access them over a secure Internet connection.
Like IaaS, PaaS includes infrastructure"servers, storage, and networking"but also middleware, development tools, business intelligence (BI) services, database management systems, and more.

Reference:
https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 87 CertyIQ

Which cloud computing model includes on-premises and cloud-based resources?

A. hybrid
B. public
C. private

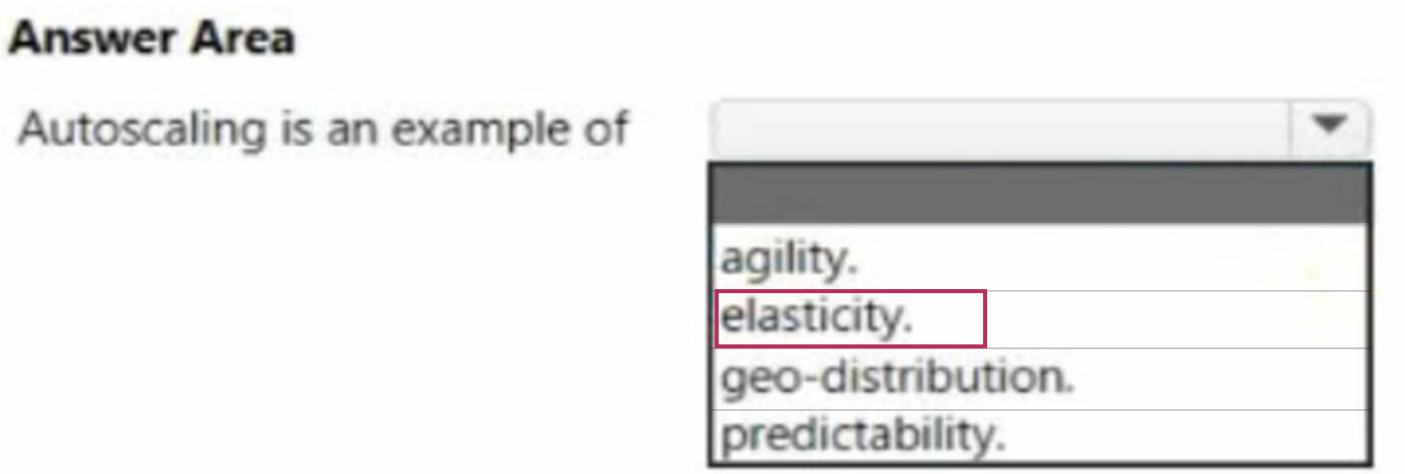
Answer: A

Explanation:
A hybrid cloud " sometimes called a cloud hybrid " is a computing environment that combines an on-premises datacenter (also called a private cloud) with a public cloud, allowing data and applications to be shared between them. Some people define hybrid cloud to include multicloud configurations where an organization uses more than one public cloud in addition to their on-premises datacenter.

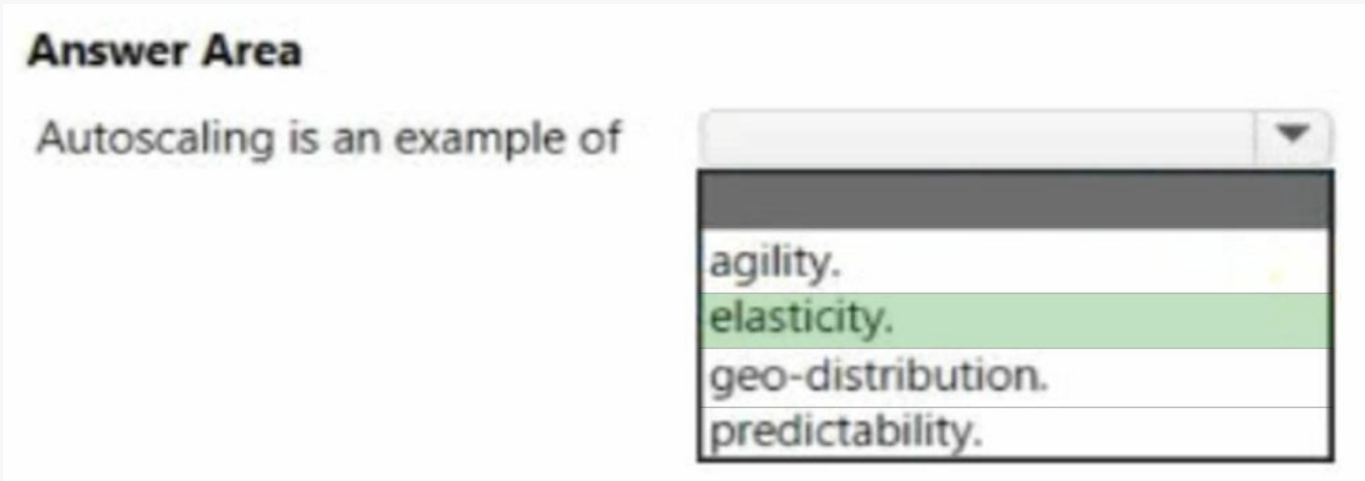
Reference:
https://azure.microsoft.com/en-us/overview/what-is-hybrid-cloud-computing/

Question: 88 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:
An Azure virtual machine scale set can automatically increase or decrease the number of VM instances that run your application. This automated and elastic behavior reduces the management overhead to monitor and optimize the performance of your application.
Also: Azure elasticity as a service is referred to a cloud service that enables in automatically scaling Azure hosted resources in par with the demand and configured parameters. It provides Azure Administrators with the ability to auto scale Azure infrastructure and resources as and when needed.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/virtual-machine-scale-sets-autoscale-overview https://www.netreo.com/cloud-automation/what-is-azure-elasticity-as-a-service/

Question: 89 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Azure Resource Manager (ARM), resource naming scope rules dictate that resources of the same type within the same resource group must have unique names. You cannot create two VNets with the exact same name inside the same resource group.

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Each Azure virtual network in a single resource group must have a unique name.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Answer:

Azure allows you to deploy multiple VNets with identical or overlapping private IP address ranges (e.g., 10.0.0.0/16) in the same subscription. While overlapping address spaces will prevent you from configuring direct VNet peering between those specific networks, the platform does not restrict address space uniqueness at the subscription level.

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Each Azure virtual network in a single resource group must have a unique name.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Explanation:
Box 1: No -
You would need to setup the VNET connections, for example with peering.
Note: You can connect virtual networks to each other with virtual network peering. These virtual networks can be in the same region or different regions (also known as Global VNet peering). Once virtual networks are peered, resources in both virtual networks can communicate with each other.

Box 2: Yes -
All Azure resource types have a scope that defines the level that resource names must be unique. A resource must have a unique name within its scope.
For example, a virtual network has a resource group scope, which means that there can be only one network named vnet-prod-westus-001 in a given resource group.

Box 3: Yes -
As you build your network in Azure, it is important to keep in mind the following universal design principles: Ensure non-overlapping address spaces. Make sure your VNet address space (CIDR block) does not overlap with your organization's other network ranges.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/tutorial-connect-virtual-networks-portal
https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/ready/azure-best-practices/resource-naming

Question: 90 CertyIQ

Which term represents the ability to increase the computing capacity of a virtual machine by adding memory or CPUs?

A. agility
B. vertical scaling
C. horizontal scaling
D. elasticity

Answer: B

Explanation:
Vertical scaling, also known as scale up and scale down, means increasing or decreasing virtual machine (VM) sizes in response to a workload. Compare this behavior with horizontal scaling, also referred to as scale out and scale in, where the number of VMs is altered depending on the workload.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/virtual-machine-scale-sets-vertical-scale-reprovision

Question: 91 CertyIQ

What are two benefits of cloud computing? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. enables the rapid provisioning of resources
B. has increased administrative complexity
C. has the same configuration options as on-premises
D. shifts capital expenditures (CAPEX) to operating expenditures (OPEX)

Answer: AD

Explanation:
Azure allows you to build, deploy, and manage apps more quickly and easily without having to buy and/or maintain the underlying infrastructure.
Azure provides flexibility between CapEx and OpEx
Capital expenditures generate benefits over a long period. These expenditures are generally nonrecurring and result in the acquisition of permanent assets.
Building an application could qualify as a capital expenditure. Example, Azure Reserved Instances (Azure RI) help Azure's most active customers save on long- term VM usage reserving VMs in advance at a discounted price by committing to a one or three-year benefits.
Operating expenditures are ongoing costs of doing business. Consuming cloud services in a pay-as-you-go model could qualify as an operating expenditure.
Example, you pay for a service or product as you use it i.e. pay-as-you-go pricing.

Reference:
https://www.protechtraining.com/blog/post/top-5-benefits-of-microsoft-azure-for-business-934
https://www.azureguru.org/capex-vs-opex/#

Question: 92 CertyIQ

What is a feature of an Azure virtual network?

A. resource cost analysis
B. packet inspection
C. geo-redundancy
D. isolation and segmentation

Isolation and Segmentation: Each VNet is fully isolated from other virtual networks by default. You can further segment the address space into one or more subnets to organize and allocate IP blocks to specific workloads (e.g., separating web tiers, business logic tiers, and database tiers).

Communication: Enabling private communication among Azure resources (like VMs), with on-premises networks (via VPN or ExpressRoute), and the internet.

Answer: D

Explanation:

isolated networking components. Segmented into one or more subnets.

Implement network segmentation patterns on Azure.

A unified enterprise segmentation strategy guides technical teams to consistently segment access using networking, applications, identity, and any other access controls. Create segmentation in your network footprint by defining perimeters.

The main reasons for segmentation are:

The ability to group related assets that are a part of (or support) workload operations.

Isolation of resources.

Governance policies set by the organization.

Reference:

https://docs.microsoft.com/en-us/azure/architecture/framework/security/design-network-segmentation

Question: 93

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

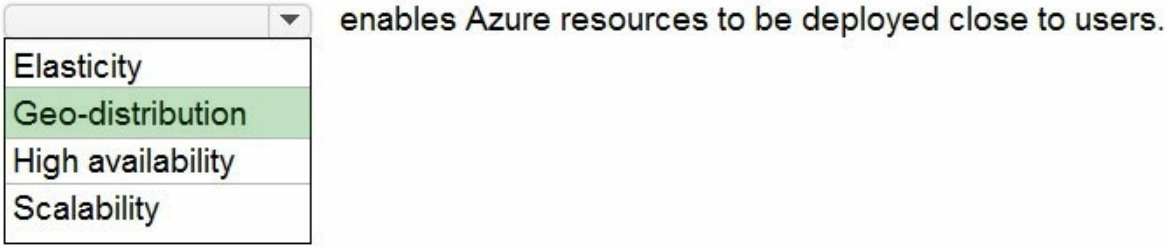
Answer Area

[▼] enables Azure resources to be deployed close to users.

- Elasticity
- Geo-distribution
- High availability
- Scalability

Answer:

Answer Area



Explanation:

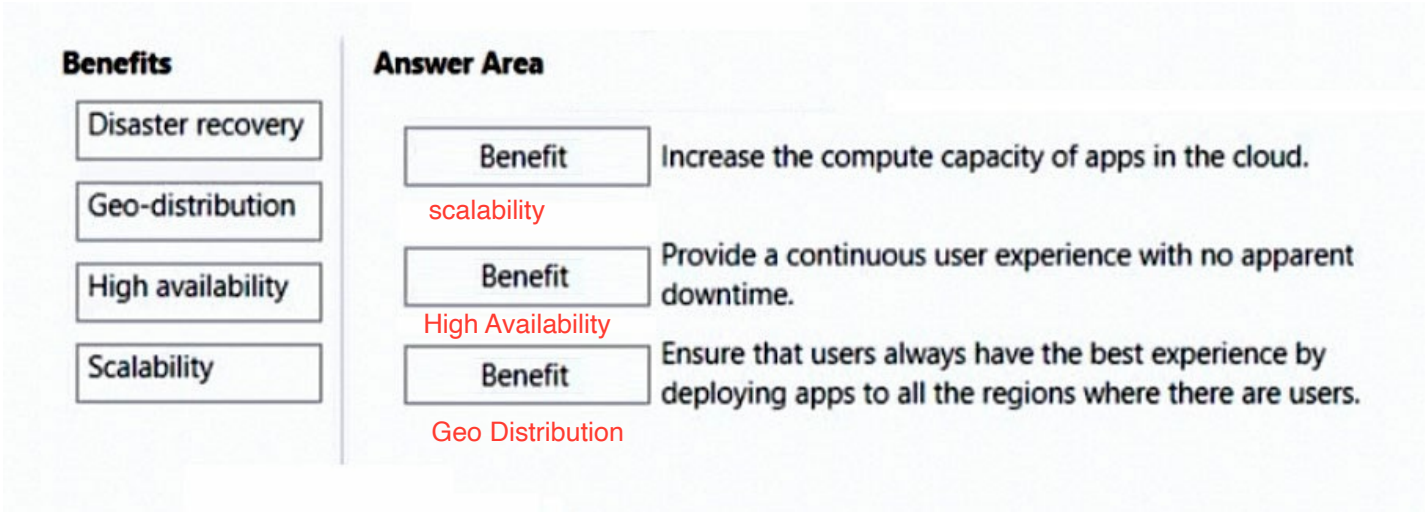
Because of geo-distribution you can deploy apps and data to regional datacenters around the globe, thereby ensuring that your customers always have the best performance in their region.

Reference:

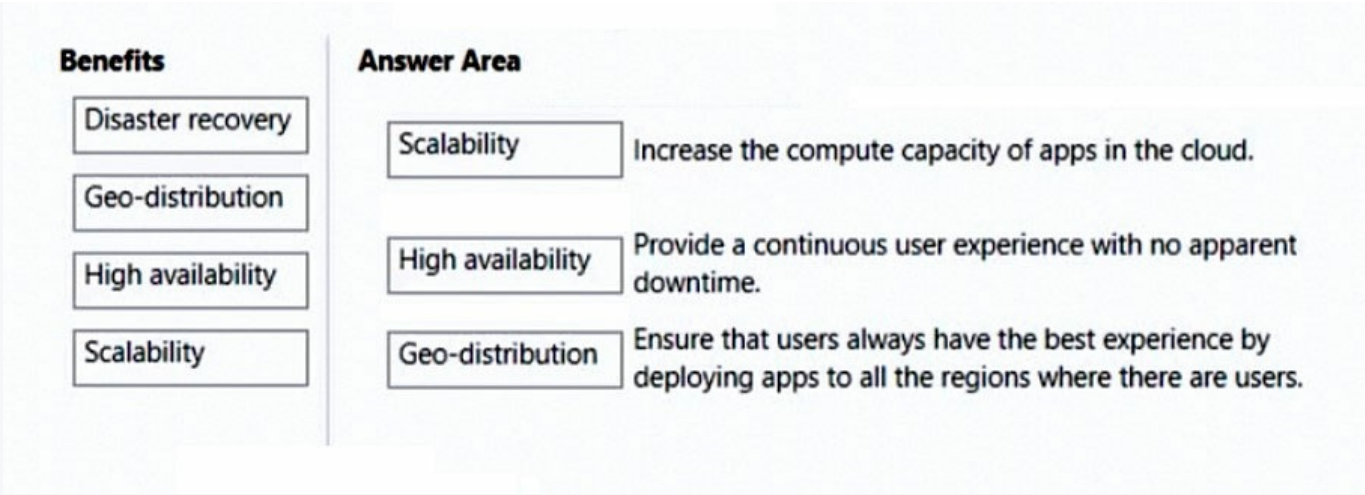
https://docs.microsoft.com/learn/modules/fundamental-azure-concepts/benefits-of-cloud-computing

Question: 94 CertyIQ

DRAG DROP -
Match the cloud computing benefits to the appropriate descriptions.
To answer, drag the appropriate benefit from the column on the left to its description on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Scalability - Increase the compute capacity of apps in the cloud

High Availability: - Provide a continuous user experience with no apparent downtime

Geo-Distribution - Ensures that users always have the best experience by deploying apps to all the regions where there are users

Reference:

https://docs.microsoft.com/learn/modules/fundamental-azure-concepts/benefits-of-cloud-computing

Question: 95 CertyIQ

Which cloud computing benefit provides continuous user access to a cloud-based application with minimal downtime?

A. agility
B. scalability
C. elasticity
D. high availability

Answer: D

Explanation:

high availability is the only answer that has to do with keeping the applications available to the users.

Question: 96 CertyIQ

You need to identify the type of failure for which an Azure Availability Zone can be used to protect access to Azure services.
What should you identify?

A. a physical server failure
B. an Azure region failure
C. a storage failure

An Availability Zone (AZ) is a physically separate location within an Azure region.

Each Availability Zone is made up of one or more datacenters equipped with independent power, cooling, and networking.

If one datacenter or zone goes down due to an outage (e.g., flood, fire, or total power loss), the remaining zones in that region continue to run and service traffic without interruption. Therefore, Availability Zones are specifically designed to provide resiliency against datacenter-level failures within a region.

D. an Azure data center failure

Answer: D

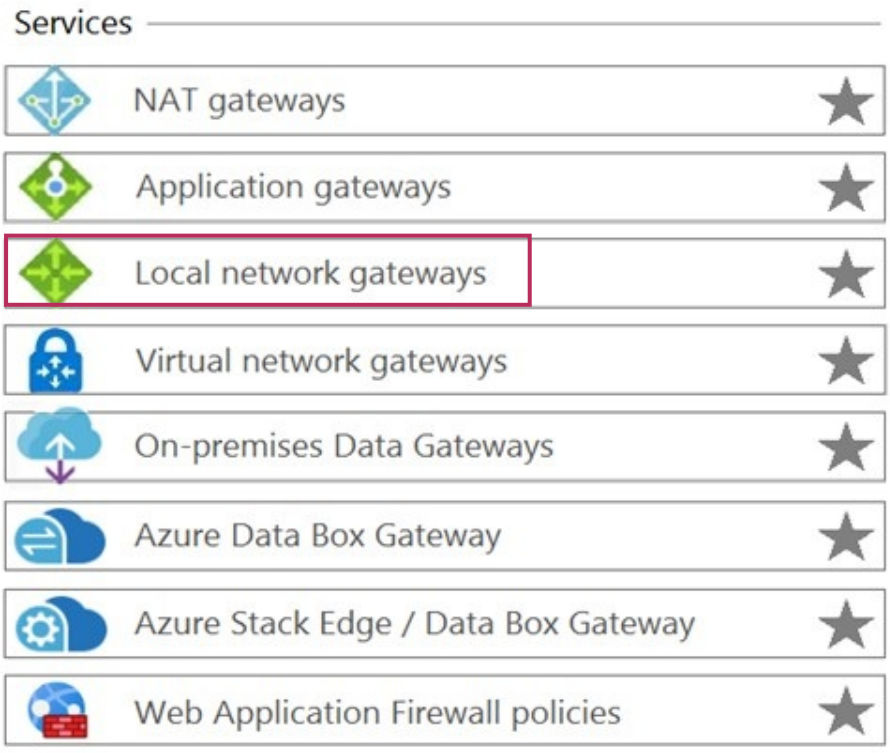
Explanation:
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.
Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/availability

Question: 97 CertyIQ

HOTSPOT -
You plan to extend your company's network to Azure.
The network contains a VPN appliance that uses an IP address of 131.107.200.1.
You need to create an Azure resource that defines the VPN appliance in Azure.
Which Azure resource should you create? To answer, select the appropriate resource in the answer area.
Hot Area:

Answer Area

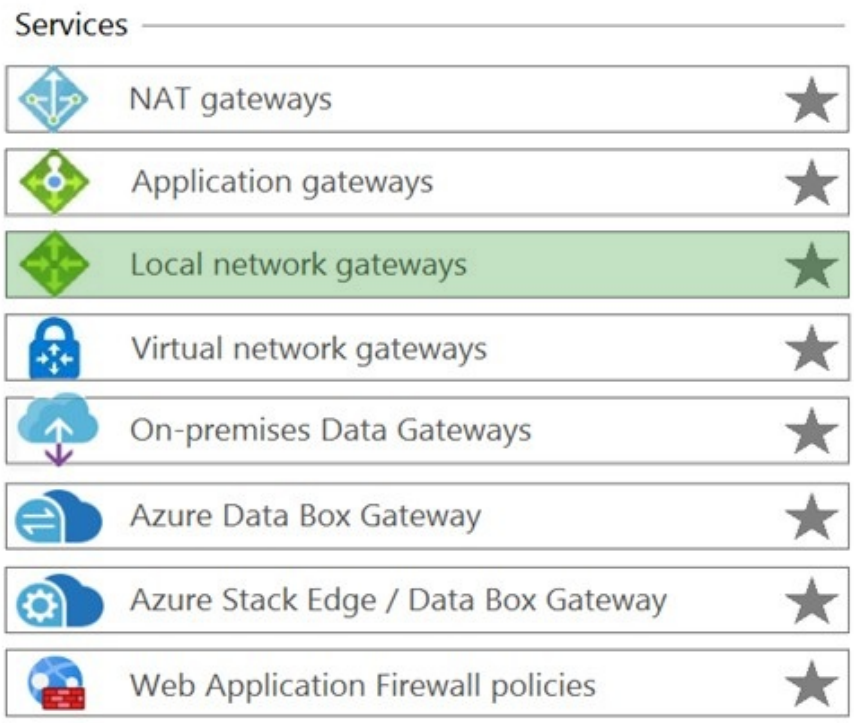


Answer:
The Local Network Gateway is the Azure resource that represents and defines your on-premises edge device (the VPN appliance). It holds the on-premises VPN device's public IP address (such as 131.107.200.1) and the on-premises IP address prefixes that will be routed across the tunnel.

The Virtual Network Gateway (VPN type) represents the software VPN router deployed inside an Azure VNet's dedicated GatewaySubnet.

When configuring the connection, Azure links the Virtual Network Gateway (the Azure end) to the Local Network Gateway (the on-premises appliance end).

Answer Area



Explanation:
A Local Network Gateway is an object in Azure that represents your on-premise VPN device. A Virtual Network Gateway is the VPN object at the Azure end of the
VPN. A 'connection' is what connects the Local Network Gateway and the Virtual Network Gateway to bring up the VPN.
The local network gateway typically refers to your on-premises location. You give the site a name by which Azure can refer to it, then specify the IP address of the on-premises VPN device to which you will create a connection. You also specify the IP address prefixes that will be routed through the VPN gateway to the VPN device. The address prefixes you specify are the prefixes located on your on-premises network. If your on-premises network changes or you need to change the public IP address for the VPN device, you can easily update the values later.

Reference:
https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-howto-site-to-site-resource-manager-portal

Question: 98 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more resource groups.
Does this meet the goal?

A. Yes
B. No

A Resource Group is strictly a logical container used for lifecycle management, billing, role-based access control (RBAC), and organizing Azure resources. It has no physical boundaries and does not influence where the actual hardware or virtual machine hosts are located.

Answer: B

To protect workloads against a single datacenter failure, virtual machines must be distributed across two or more Availability Zones within an Azure region. Each Availability Zone consists of one or more physically separate datacenters with independent power, cooling, and networking infrastructure.

Explanation:

This questions repeated 3 times with different solutions don't get confused here am providing clear cut explaianation :

solution-1: You deploy VM to two or more resource groups (NO)

solution-2: You deploy VM to two or more availability zones(YES)

solution-3: You deploy VM to or more regions (N))

A resource group is a logical container for Azure resources. When you create a resource group, you specify which location to create the resource group in.

However, when you create a virtual machine and place it in the resource group, the virtual machine can still be in a different location (different datacenter).

Therefore, creating multiple resource groups, even if they are in separate datacenters does not ensure that the services running on the virtual machines are available if a single data center fails.

References:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups

Question: 99 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to a scale set.
Does this meet the goal?

A. Yes
B. No

A Virtual Machine Scale Set (VMSS) by default provides elasticity, load balancing, and autoscaling across identical VM instances, but it does not inherently guarantee protection against a datacenter failure unless it is explicitly configured as zone-redundant (spanning multiple Availability Zones).

To protect workloads against a single datacenter failure, virtual machines must be distributed across two or more Availability Zones within an Azure region. Each Availability Zone consists of one or more physically separate datacenters with independent power, cooling, and networking infrastructure.

Answer: B

Explanation:

This answer does not specify that the scale set will be configured across multiple data centers so this solution does not meet the goal.
Azure virtual machine scale sets let you create and manage a group of load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. Scale sets provide high availability to your applications, and allow you to centrally manage, configure, and update many VMs.
Virtual machines in a scale set can be deployed across multiple update domains and fault domains to maximize availability and resilience to outages due to data center outages, and planned or unplanned maintenance events.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/availability

Question: 100 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

In the trust hierarchy between subscriptions and directories, an Azure subscription trusts only one Microsoft Entra ID (Azure AD) tenant at any given time. Conversely, a single directory tenant can trust and manage multiple subscriptions (a 1:N tenant-to-subscription relationship).

Statements	Yes	No
An Azure subscription can be associated to multiple Azure Active Directory (Azure AD) tenants.	○	○
You can change the Azure Active Directory (Azure AD) tenant to which an Azure subscription is associated.	○	○
When an Azure subscription expires, the associated Azure Active Directory (Azure AD) tenant is deleted automatically.	○	○

Answer: Subscriptions and Microsoft Entra ID tenants have separate, independent lifecycles. A tenant is an identity container that can host users, groups, application registrations, and multiple other subscriptions (or Microsoft 365 services). When an individual subscription expires or is canceled, only the resources within that subscription are affected; the directory tenant itself remains intact.

Answer Area

Statements	Yes	No
An Azure subscription can be associated to multiple Azure Active Directory (Azure AD) tenants.	○	○
You can change the Azure Active Directory (Azure AD) tenant to which an Azure subscription is associated.	○	○
When an Azure subscription expires, the associated Azure Active Directory (Azure AD) tenant is deleted automatically.	○	○

Explanation:
Box 1: No -
An Azure AD tenant can have multiple subscriptions but an Azure subscription can only be associated with one Azure AD tenant.

Box 2: Yes -

Box 3: No -
If your subscription expires, you lose access to all the other resources associated with the subscription. However, the Azure AD directory remains in Azure. You can associate and manage the directory using a different Azure subscription.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/fundamentals/active-directory-how-subscriptions-associated-directory

Question: 101 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
Resource groups provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Management groups
C. Azure policies
D. Azure App Service plans

Management Groups are containers positioned above subscriptions to manage access, policy, and compliance across multiple subscriptions efficiently.

Answer:

B

Governance conditions (such as Azure Policy assignments and Azure RBAC roles) applied at the management group level automatically inherit downward to all subscriptions and child resources within that management group hierarchy.

Explanation:

A resource group exists strictly inside a single subscription and cannot span across or govern multiple subscriptions.

"Azure management groups are containers for managing compliances across multiple subscriptions."

Question: 102 CertyIQ

Your company plans to migrate to Azure.
The company has several departments. All the Azure resources used by each department will be managed by a department administrator.
What are two possible techniques to segment Azure for the departments? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. multiple subscriptions
B. multiple Azure Active Directory (Azure AD) directories
C. multiple regions
D. multiple resource groups

Subscriptions (A): An Azure subscription serves as both a billing boundary and an access/administrative boundary. Assigning a dedicated subscription to each department allows the department administrator to have full administrative permissions (such as Owner or Contributor) scoped solely to their department's workloads.

Resource Groups (D): A resource group is a logical container for resources deployed within a subscription. Azure RBAC allows permissions to be assigned directly at the resource group scope, granting department administrators management rights over only their department's resource group without granting access to other groups.

Answer: AD

Explanation:

An Azure subscription is a container for Azure resources. It is also a boundary for permissions to resources and for billing. You are charged monthly for all resources in a subscription. A single Azure tenant (Azure Active Directory) can contain multiple Azure subscriptions.
A resource group is a container that holds related resources for an Azure solution. The resource group can include all the resources for the solution, or only those resources that you want to manage as a group.
To enable each department administrator to manage the Azure resources used by that department, you will need to create a separate subscription per department. You can then assign each department administrator as an administrator for the subscription to enable them to manage all resources in that subscription.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/create-subscription
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/add-change-subscription-administrator

Question: 103 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A single Microsoft account can be used to manage multiple Azure subscriptions.	○	○
Two Azure subscriptions can be merged into a single subscription.	○	○
A company can use resources from multiple subscriptions.	○	○

An identity (whether a personal Microsoft Account [MSA] or a Microsoft Entra ID organizational work/school account) can be granted administrative or RBAC roles (such as Owner, Contributor, or Reader) across multiple independent Azure subscriptions. When signing in to the Azure Portal, that user account can switch between and manage all associated subscriptions

In Azure, subscriptions are distinct billing, identity boundary, and quota containers. You cannot merge or combine two Azure subscriptions into one. While you can move resources individually or in bulk from one subscription to another, the subscriptions themselves remain separate entities and cannot be merged.

Answer: An enterprise organization typically deploys a multi-subscription topology (e.g., separating Production, Development, Testing, or different departments) structured under Management Groups. Workloads and users within the company routinely utilize and interact with resources residing across multiple subscriptions (for example, peering virtual networks across subscriptions or consuming shared services)

Answer Area

Statements	Yes	No
A single Microsoft account can be used to manage multiple Azure subscriptions.	○	○
Two Azure subscriptions can be merged into a single subscription.	○	○
A company can use resources from multiple subscriptions.	○	○

Explanation:
Box 1: Yes -
You can use the same account to manage multiple subscriptions. You can create an additional subscription for your account in the Azure portal. You may want an additional subscription to avoid hitting subscription limits, to create separate environments for security, or to isolate data for compliance reasons.

Box 2: No -
You cannot merge two subscriptions into a single subscription. However, you can move some Azure resources from one subscription to another. You can also transfer ownership of a subscription and change the billing type for a subscription.

Box 3: Yes -
A company can have multiple subscriptions and store resources in the different subscriptions. However, a resource instance can exist in only one subscription.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/create-subscription

Question: 104 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Under Azure Resource Manager (ARM), resources can be moved between resource groups and across different subscriptions within the same Microsoft Entra ID tenant (or even transferred across tenants) using the Azure portal, Azure CLI (az resource move), PowerShell, or REST API.

Virtual machines, their attached managed disks, virtual network interfaces (NICs), and associated virtual network resources are fully supported for cross-subscription movement without needing to rebuild or redeploy them.

Answer Area

You have several virtual machines in an Azure subscription.
You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2016.

Answer:

Answer Area

You have several virtual machines in an Azure subscription.
You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2016.

Explanation:
You can move a VM and its associated resources to a different subscription by using the Azure portal. Moving between subscriptions can be handy if you originally created a VM in a personal subscription and now want to move it to your company's subscription to continue your work. You do not need to start the VM in order to move it and it should continue to run during the move.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/move-vm

Question: 105 CertyIQ

You have an Azure environment that contains multiple Azure virtual machines.
You plan to implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines.
You need to recommend which Azure resources must be created for the planned solution.
Which two Azure resources should you include in the recommendation? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. a virtual network gateway
B. a load balancer
C. an application gateway
D. a virtual network

Virtual Network Gateway (A): The VPN Gateway itself must be deployed into that GatewaySubnet to route encrypted traffic between Azure and the on-premises environment.

E. a gateway subnet

Gateway Subnet (E): The existing virtual network hosting the VMs must contain a dedicated subnet named specifically GatewaySubnet. This subnet is reserved exclusively for the gateway's internal VMs and routing services.

Answer: AE

Explanation:

If you already have Azure VMs, this implies you have a VNet already. Thus the answer should be Gateway Subnet and VNet Gateway

To implement a solution that enables the client computers on your on-premises network to communicate to the Azure virtual machines, you need to configure a

VPN (Virtual Private Network) to connect the on-premises network to the Azure virtual network.

The Azure VPN device is known as a Virtual Network Gateway. The virtual network gateway needs to be located in a dedicated subnet in the Azure virtual network. This dedicated subnet is known as a gateway subnet and must be named 'GatewaySubnet'.

Note: a virtual network (answer D) is also required. However, as we already have virtual machines deployed in a Azure, we can assume that the virtual network is already in place.

References:

https://docs.microsoft.com/en-us/office365/enterprise/connect-an-on-premises-network-to-a-microsoft-azure-virtual-network

Question: 106

CertyIQ

You attempt to create several managed Microsoft SQL Server instances in an Azure environment and receive a message that you must increase your Azure subscription limits.
What should you do to increase the limits?

A. Create a service health alert
B. Upgrade your support plan
C. Modify an Azure policy
D. Create a new support request

Azure subscriptions have default usage limits and quotas on resources (such as vCPU cores, managed instances, and storage accounts) to prevent unintended over-provisioning and manage capacity across datacenters.

To request an increase above the default quota limit, an administrator must open a Service and subscription limit (quota) support request in the Azure portal under

Help + support -> New support request.

Answer: D

Quota increase requests are processed by Microsoft support at no additional charge, even on free/basic subscription tiers.

Explanation:

Many Azure resource have quote limits. The purpose of the quota limits is to help you control your Azure costs. However, it is common to require an increase to the default quota.
You can request a quota limit increase by opening a support request. In the support request, select 'Service and subscription limits (quotas)' for the Issue type, select your subscription and the service you want to increase the quota for. For this question, you would select 'SQL Database Managed Instance' as the quote type.

Reference:
https://docs.microsoft.com/en-us/azure/sql-database/sql-database-managed-instance-resource-limits#obtaining-a-larger-quota-for-sql-managed-instance

Question: 107 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Each Azure subscription can contain multiple account administrators.	○	○
Each Azure subscription can be managed by using a Microsoft account only.	○	○
An Azure resource group contains multiple Azure subscriptions.	○	○

Answer: Azure subscriptions can be managed by both personal Microsoft accounts (MSA) (e.g., @outlook.com, @live.com) and enterprise organizational/work accounts backed by Microsoft Entra ID (formerly Azure AD). Management is not restricted to personal Microsoft accounts only.

Answer Area

Statements	Yes	No
Each Azure subscription can contain multiple account administrators.	○	○
Each Azure subscription can be managed by using a Microsoft account only.	○	○
An Azure resource group contains multiple Azure subscriptions.	○	○

Explanation:

Box 1: No -

You can assign service administrators and co-administrators in the Azure Portal but there can only be one account administrator.

Box 2: No -

You need an Azure Active Directory account to manage a subscription, not a Microsoft account.

An account is created in the Azure Active Directory when you create the subscription. Further accounts can be created in the Azure Active Directory to manage the subscription.

Box 3: No -

Resource groups are logical containers for Azure resources. However, resource groups do not contain subscriptions. Subscriptions contain resource groups.

Reference:

https://docs.microsoft.com/en-us/office365/enterprise/subscriptions-licenses-accounts-and-tenants-for-microsoft-cloud-offerings

Question: 108 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Availability zones can be implemented in all Azure regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Answer: Availability Zones exist within a single Azure region. They provide resiliency and redundancy against data center failures inside that specific region. Replicating data and workloads across multiple regions is handled by cross-region services, Azure Region Pairs, or Geo-redundant storage (GRS), not by Availability Zones.

Answer Area

Statements	Yes	No
Availability zones can be implemented in all Azure regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Explanation:
Box 1: No -
Not all Azure regions support availability zones.

Box 2: No -
Availability zones can be used with many Azure services, not just VMs.

Box 3: No -
Availability Zones are unique physical locations within a single Azure region.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-region#azure-regions-with-availability-zones

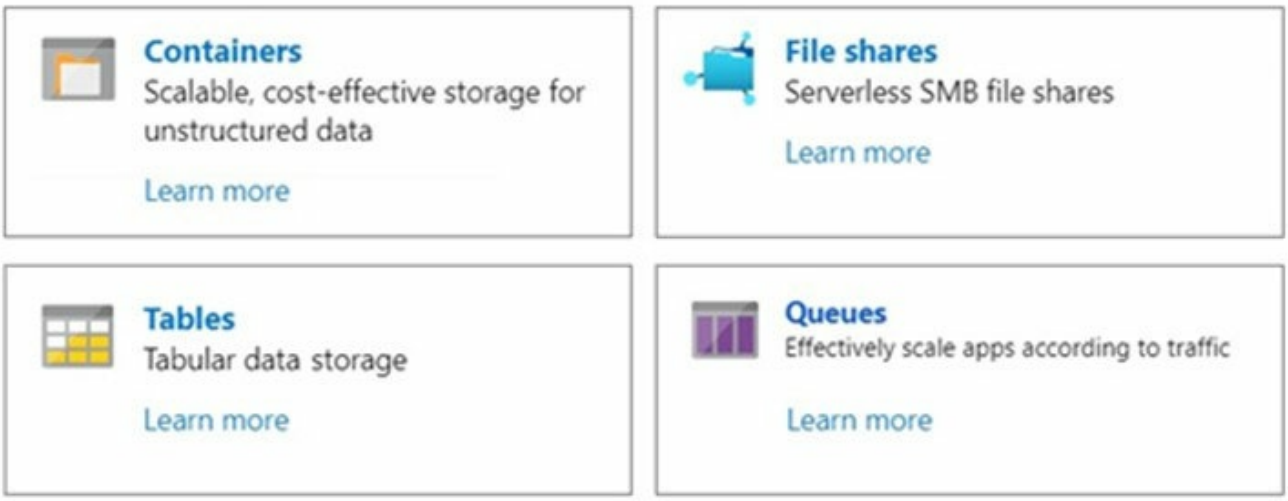
Question: 109 CertyIQ

HOTSPOT -
You plan to create an Azure virtual machine.
You need to identify which storage service must be used to store the unmanaged data disks of the virtual machine.
What should you identify? To answer, select the appropriate service in the answer area.
Hot Area:

Unmanaged disks in Azure are stored as Page Blobs (.vhd files) inside a user-managed Azure Storage Account container.

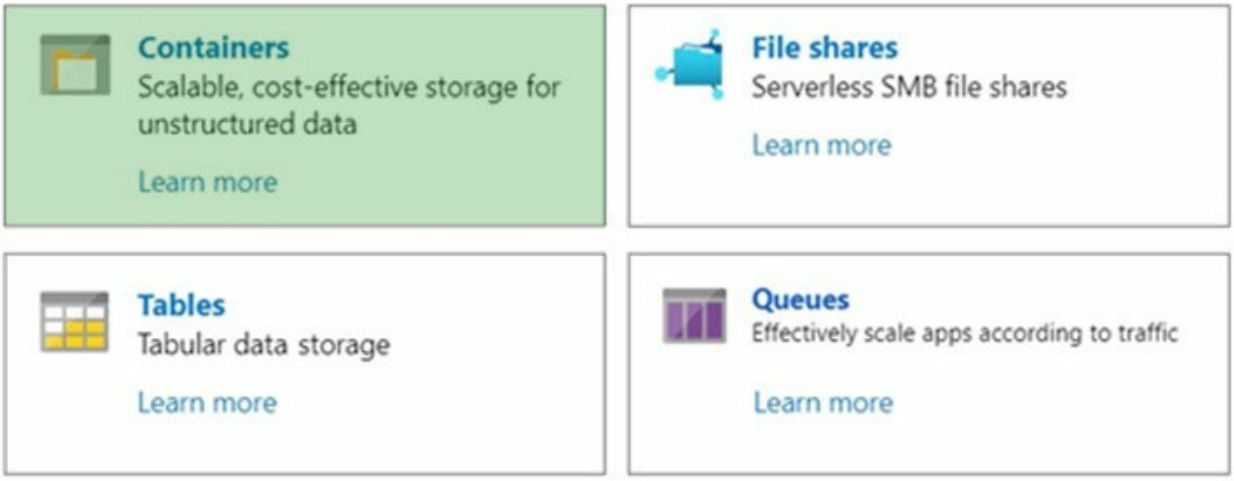
Answer Area

While modern architectures strongly recommend Managed Disks (where Azure automatically provisions and manages the underlying storage account), unmanaged disks require the customer to create an Azure Storage Account and store the VHD files inside a Blob Container



Answer:

Answer Area



Explanation:

Azure containers are the backbone of the virtual disks platform for Azure IaaS. Both Azure OS and data disks are implemented as virtual disks where data is durably persisted in the Azure Storage platform and then delivered to the virtual machines for maximum performance. Azure Disks are persisted in Hyper-V VHD format and stored as a page blob in Azure Storage.

Reference:
https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-pageblob-overview

Question: 110 CertyIQ

Your company plans to move several servers to Azure.
The company's compliance policy states that a server named FinServer must be on a separate network segment.
You are evaluating which Azure services can be used to meet the compliance policy requirements.
Which Azure solution should you recommend?

A. a resource group for FinServer and another resource group for all the other servers
B. a virtual network for FinServer and another virtual network for all the other servers
C. a VPN for FinServer and a virtual network gateway for each other server

D. one resource group for all the servers and a resource lock for FinServer

Answer: B

Explanation:
Networks in Azure are known as virtual networks. A virtual network can have multiple IP address spaces and multiple subnets. Azure automatically routes traffic between different subnets within a virtual network.
The question states that FinServer must be on a separate network segment. The only way to separate FinServer from the other servers in networking terms is to place the server in a different virtual network to the other servers.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/virtual-network-vnet-plan-design-arm

Question: 111 CertyIQ

You plan to map a network drive from several computers that run Windows 10 to Azure Storage.
You need to create a storage solution in Azure for the planned mapped drive.
What should you create?

A. an Azure SQL database
B. a virtual machine data disk
C. a File service in a storage account
D. a Blob service in a storage account

Azure Files (File service in a storage account) offers fully managed cloud file shares accessible via the industry-standard Server Message Block (SMB) and Network File System (NFS) protocols.

Windows client operating systems (like Windows 10) can mount and map an Azure Files share directly as a local network drive (e.g., drive letter Z:) over SMB (port 445), allowing concurrent access across multiple machines simultaneously

Answer: C

Explanation:
Azure Files is Microsoft's easy-to-use cloud file system. Azure file shares can be seamlessly used in Windows and Windows Server.
To use an Azure file share with Windows, you must either mount it, which means assigning it a drive letter or mount point path, or access it via its UNC path.
Unlike other SMB shares you may have interacted with, such as those hosted on a Windows Server, Linux Samba server, or NAS device, Azure file shares do not currently support Kerberos authentication with your Active Directory (AD) or Azure Active Directory (AAD) identity, although this is a feature we are working on.
Instead, you must access your Azure file share with the storage account key for the storage account containing your Azure file share. A storage account key is an administrator key for a storage account, including administrator permissions to all files and folders within the file share you're accessing, and for all file shares and other storage resources (blobs, queues, tables, etc) contained within your storage account.

Reference:
https://docs.microsoft.com/en-us/azure/storage/files/storage-how-to-use-files-windows

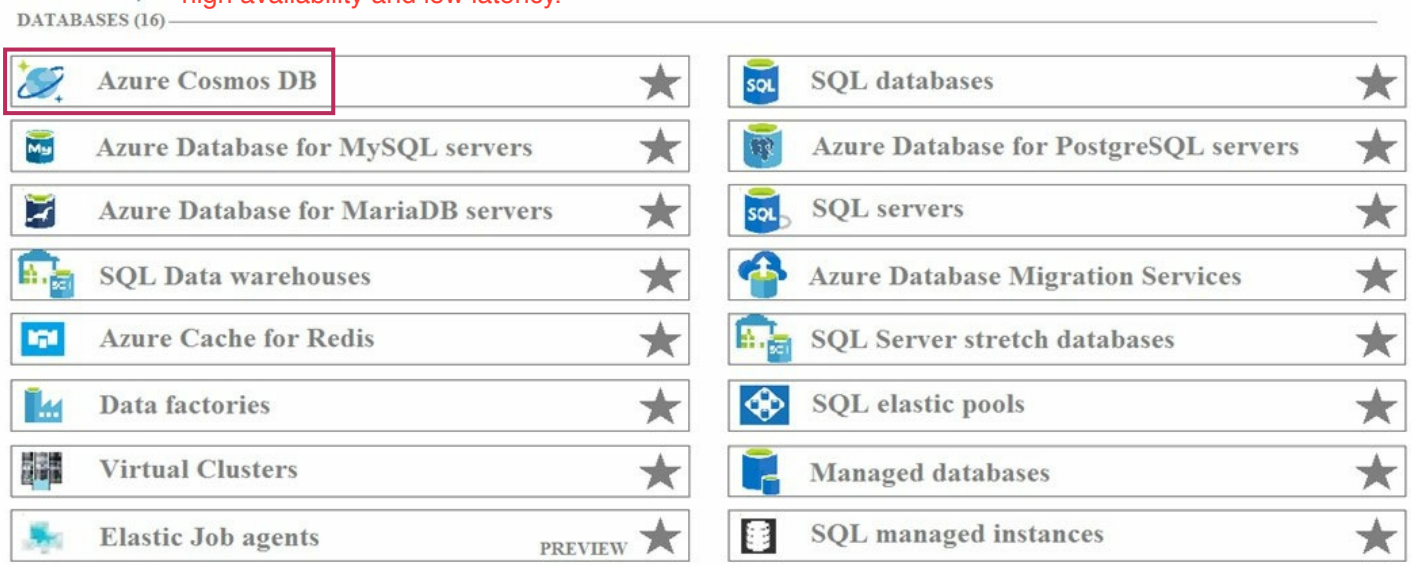
Question: 112 CertyIQ

HOTSPOT -
You plan to implement an Azure database solution.
You need to implement a database solution that meets the following requirements:
- Can add data concurrently from multiple regions
- Can store JSON documents

Which database service should you deploy? To answer, select the appropriate service in the answer area.

Hot Area:

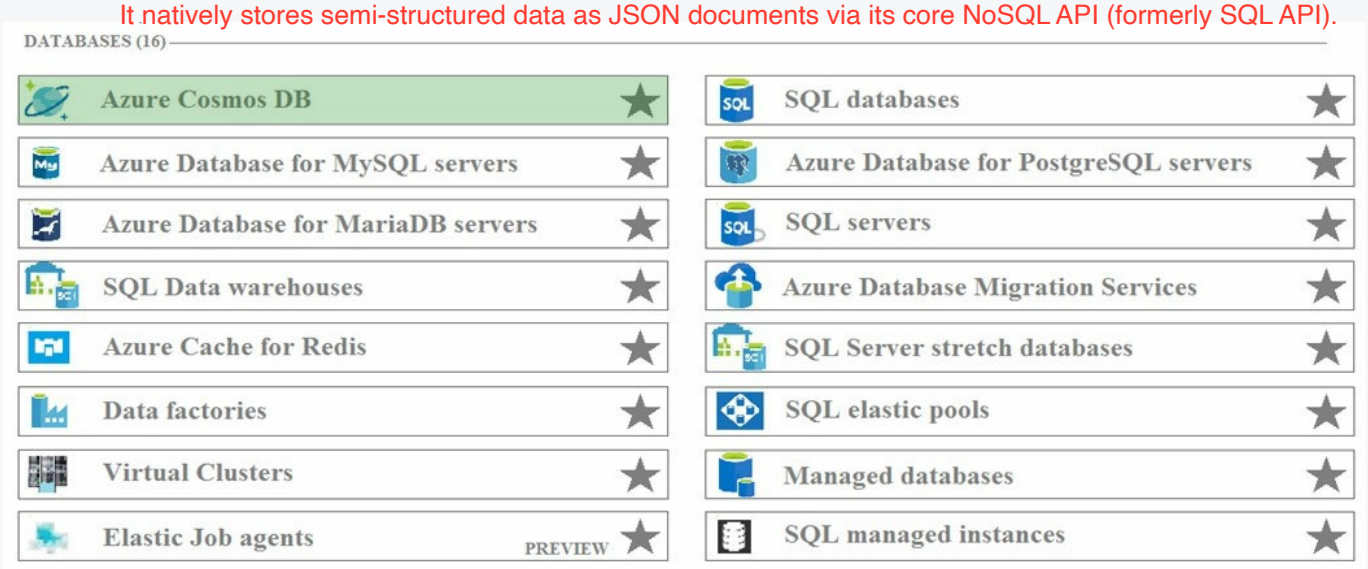
Azure Cosmos DB is Microsoft's globally distributed, multi-model NoSQL database service designed for high availability and low latency.



It natively supports multi-region writes (allowing applications to write and add data concurrently across multiple Azure regions with automatic conflict resolution).

Answer:

It natively stores semi-structured data as JSON documents via its core NoSQL API (formerly SQL API).



Explanation:

Azure Cosmos DB is Microsoft's globally distributed, multi-model database service. With a click of a button, Cosmos DB enables you to elastically and independently scale throughput and storage across any number of Azure regions worldwide.

Azure Cosmos DB is a great way to store unstructured and JSON data. Combined with Azure Functions, Cosmos DB makes storing data quick and easy with much less code than required for storing data in a relational database.

Reference:

https://docs.microsoft.com/en-us/azure/cosmos-db/introduction https://docs.microsoft.com/en-us/azure/azure-functions/functions-integrate-store-unstructured-data-cosmosdb?tabs=csharp

Question: 113

CertyIQ

Your company plans to start using Azure and will migrate all its network resources to Azure.
You need to start the planning process by exploring Azure.
What should you create first?

A. a subscription

B. a resource group

An Azure Subscription provides authenticated and authorized access to Azure cloud products and services. It serves as the primary billing boundary and the foundational container required before provisioning any cloud assets. You cannot create a resource group, deploy a virtual network, or organize subscriptions under management groups without first establishing an active Azure subscription tied to an account and payment model.

C. a virtual network

D. a management group

Answer: A

Explanation:
The first thing you create in Azure is a subscription. You can think of an Azure subscription as an 'Azure account'. You get billed per subscription.
A subscription is an agreement with Microsoft to use one or more Microsoft cloud platforms or services, for which charges accrue based on either a per-user license fee or on cloud-based resource consumption.
✑ Microsoft's Software as a Service (SaaS)-based cloud offerings (Office 365, Intune/EMS, and Dynamics 365) charge per-user license fees.
✑ Microsoft's Platform as a Service (PaaS) and Infrastructure as a Service (IaaS) cloud offerings (Azure) charge based on cloud resource consumption.
You can also use a trial subscription, but the subscription expires after a specific amount of time or consumption charges. You can convert a trial subscription to a paid subscription.
Organizations can have multiple subscriptions for Microsoft's cloud offerings.

Reference:
https://docs.microsoft.com/en-us/office365/enterprise/subscriptions-licenses-accounts-and-tenants-for-microsoft-cloud-offerings

Question: 114 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

A resource group has its own location to store its metadata, but the resources placed inside it do not need to be in the same region as the resource group or each other. You can deploy a virtual machine in East US and a storage account in West Europe into the exact same resource group.

Statements	Yes	No
All the Azure resources deployed to a resource group must use the same Azure region.	○	○
If you assign a tag to a resource group, all the Azure resources in that resource group are assigned to the same tag.	○	○

When you assign a user permissions at the resource group level (e.g., Contributor or Owner), those permissions are automatically inherited by all child resources contained within that resource group.

If you assign permissions for a user to manage a resource group, the user can manage all the Azure resources in that resource group.	○	○

Answer:

Answer Area

Statements	Yes	No
All the Azure resources deployed to a resource group must use the same Azure region.	○	●
If you assign a tag to a resource group, all the Azure resources in that resource group are assigned to the same tag.	○	●
If you assign permissions for a user to manage a resource group, the user can manage all the Azure resources in that resource group.	●	○

Explanation:

Box 1: No -

Azure resources deployed to a single resource group can be located in different regions. The resource group only contains metadata about the resources it contains.

When creating a resource group, you need to provide a location for that resource group. You may be wondering, "Why does a resource group need a location?

And, if the resources can have different locations than the resource group, why does the resource group location matter at all?" The resource group stores metadata about the resources. When you specify a location for the resource group, you're specifying where that metadata is stored. For compliance reasons, you may need to ensure that your data is stored in a particular region.

Box 2: No -

Tags for Resources are not inherited by default from their Resource Group

Box 3: Yes -

A resource group can be used to scope access control for administrative actions. By default, permissions set at the resource level are inherited by the resources in the resource group.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview

Question: 115 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Azure Blob Storage provides online tiers (Hot and Cool) and an offline tier (Archive).

Answer Area

The Archive access tier is an offline storage tier optimized for data that is rarely accessed and can tolerate retrieval latency of several hours.

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Answer:

While a blob is in the Archive tier, it is offline and cannot be directly read, downloaded, or modified. To read or access the data, you must first change the tier to an online tier (Hot or Cool) or copy it to an online tier—a process officially defined in Azure as blob rehydration.

Answer Area

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Explanation:
Azure storage offers different access tiers: hot, cool and archive.
The archive access tier has the lowest storage cost. But it has higher data retrieval costs compared to the hot and cool tiers. Data in the archive tier can take several hours to retrieve.
While a blob is in archive storage, the blob data is offline and can't be read, overwritten, or modified. To read or download a blob in archive, you must first rehydrate it to an online tier.
Example usage scenarios for the archive access tier include:
- Long-term backup, secondary backup, and archival datasets
- Original (raw) data that must be preserved, even after it has been processed into final usable form.
- Compliance and archival data that needs to be stored for a long time and is hardly ever accessed.

Reference:
https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers?tabs=azure-portal#archive-access-tier

Question: 116 CertyIQ

HOTSPOT -
You plan to deploy a critical line-of-business application to Azure.
The application will run on an Azure virtual machine.
You need to recommend a deployment solution for the application. The solution must provide a guaranteed availability of 99.99 percent.

What is the minimum number of virtual machines and the minimum number of availability zones you should recommend for the deployment? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

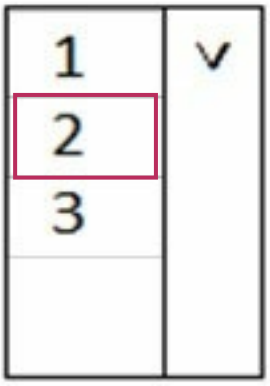
Answer Area

Minimum number of virtual machines:

99.9% / 99.5%: Applies to a single VM using Premium SSD / Ultra Disk storage.

Therefore, to reach the 99.99% threshold with the minimum footprint, you need at least 2 virtual machines distributed across at least 2 availability zones (1 VM per zone).

Minimum number of availability zones:

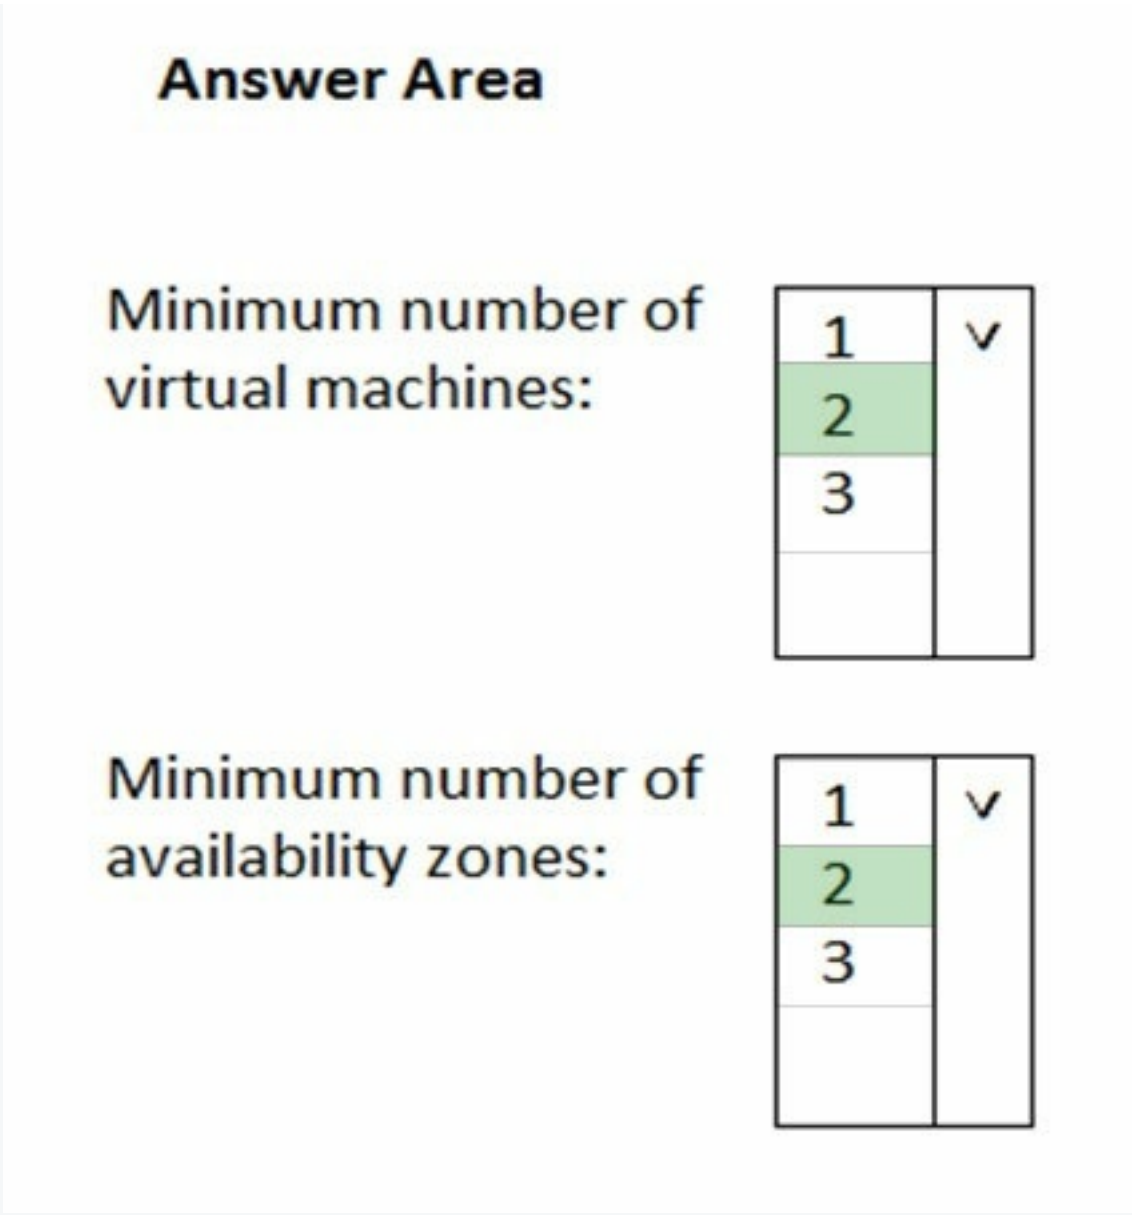


According to the official Microsoft Service Level Agreements (SLA) for Virtual Machines:

99.99% (Four Nines): Requires at least two or more instances deployed across two or more Availability Zones in the same Azure region.

99.95%: Requires two or more instances deployed across separate Fault and Update Domains within the same Availability Set.

Answer:



Explanation:
You need a minimum of two virtual machines with each one located in a different availability zone. Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there's a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures. Zone-redundant services replicate your applications and data across Availability Zones to protect from single-points-of-failure. With Availability Zones, Azure offers industry best 99.99% VM uptime SLA.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 117 CertyIQ

Which Azure service should you use to collect events from multiple resources into a centralized repository?

A. Azure Event Hubs
B. Azure Analysis Services
C. Azure Monitor
D. Azure Stream Analytics

Azure Event Hubs is a fully managed, real-time data ingestion service (event streaming platform) capable of receiving and processing millions of events per second from distributed sources and resources. It acts as a centralized repository and front door for streaming architectures, allowing incoming event telemetry to be stored, buffered, and forwarded to downstream analytics or processing services.

Answer: A

Explanation:

keyword is "event" and not just any telemetry data.

"Azure Event Hubs — A big data streaming platform and event ingestion service"

https://docs.microsoft.com/en-us/azure/event-hubs/event-hubs-about

Question: 118 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

An Availability Zone in Azure has physically separate locations [▼]

- across two continents.
- within a single Azure region.
- within multiple Azure regions.
- within a single Azure datacenter.

An Availability Zone is a high-availability offering that protects applications and data from datacenter failures.
Availability Zones are unique, physically separate locations within a single Azure region.
Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking infrastructure, connected to each other through a dedicated high-speed, low-latency private fiber network.

Answer:

Answer Area

An Availability Zone in Azure has physically separate locations [▼]

- across two continents.
- within a single Azure region.
- within multiple Azure regions.
- within a single Azure datacenter.

Explanation:
Availability Zones is a high-availability offering that protects your applications and data from datacenter failures. Availability Zones are unique physical locations within an Azure region.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 119 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Cross-datacenter redundancy is not automatic for all configurations. Under LRS, all three copies remain entirely within the same physical data center. To replicate data across separate facilities, the customer must intentionally configure Zone-Redundant Storage (ZRS) (spanning three availability zones/datacenters within the region) or Geo-Redundant Storage (GRS) (replicating to a paired secondary region).

Answer Area

Statements	Yes	No
Data that is stored in an Azure Storage account automatically has at least three copies.	○	○
All data that is copied to an Azure Storage account is backed up automatically to another Azure data center.	○	○
An Azure Storage account can contain up to 2 TB of data and up to one million files.	○	○

Answer: Standard Azure general-purpose v2 storage accounts have a maximum capacity of 5 PiB (petabytes), and there is no artificial ceiling of one million files. The 2 TB limit is an obsolete restriction from legacy services (such as early StorSimple or very early cloud backup volumes) and does not apply to Azure Storage accounts.

Answer Area

Statements	Yes	No
Data that is stored in an Azure Storage account automatically has at least three copies.	○	○
All data that is copied to an Azure Storage account is backed up automatically to another Azure data center.	○	○
An Azure Storage account can contain up to 2 TB of data and up to one million files.	○	○

Explanation:

Box 1: Yes -

There are different replication options available with a storage account. The 'minimum' replication option is Locally Redundant Storage (LRS). With LRS, data is replicated synchronously three times within the primary region.

Box 2: No -

Data is not backed up automatically to another Azure Data Center although it can be depending on the replication option configured for the account. Locally

Redundant Storage (LRS) is the default which maintains three copies of the data in the data center.

Geo-redundant storage (GRS) has cross-regional replication to protect against regional outages. Data is replicated synchronously three times in the primary region, then replicated asynchronously to the secondary region.

Box 3: No -

The limits are much higher than that. The current storage limit is 2 PB for US and Europe, and 500 TB for all other regions (including the UK) with no limit on the number of files.

Reference:

https://docs.microsoft.com/en-us/azure/storage/common/storage-account-overview

Question: 120 CertyIQ

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Not all Azure regions support Availability Zones. While Microsoft features availability zones across major standard geographies, certain legacy, specialized, satellite, or sovereign cloud regions do not have multiple isolated physical datacenter zones. Deploying resources across every region does not change regional physical architecture or make zones universally available.

Answer Area

Statements	Yes	No
If you have Azure resources deployed to every region, you can implement availability zones in all the regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Answer: Availability Zones are designed for intra-region resiliency, providing isolation across datacenters within a single Azure region. Replication of data and applications across multiple regions is achieved through cross-region mechanisms, such as Azure Region Pairs, Geo-Redundant Storage (GRS), or global load balancing (e.g., Azure Front Door, Azure Traffic Manager).

Answer Area

Statements	Yes	No
If you have Azure resources deployed to every region, you can implement availability zones in all the regions.	○	○
Only virtual machines that run Windows Server can be created in availability zones.	○	○
Availability zones are used to replicate data and applications to multiple regions.	○	○

Explanation:

Box 1: No -

Not all Azure regions support availability zones.

Box 2: No -

Regions that support availability zones support Linux virtual machines.

Box 3: No

Availability zones are used to replicate data and applications in the same region.

Question: 121 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

North America contains numerous Azure regions across the United States, Canada, and Mexico (e.g., East US, East US 2, West US, Central US, Canada Central, Mexico Central). A geography like North America is never represented by just a single region.

By definition, an Azure region is a geographical perimeter containing at least one datacenter, but not necessarily multiple physical datacenters. While regions with Availability Zones contain multiple datacenters, certain smaller, legacy, or specialized regions may comprise a single datacenter facility.

Answer Area

Statements	Yes	No
North America is represented by a single Azure region.	○	○
Every Azure region has multiple datacenters.	○	○
Data transfers between Azure services located in different Azure regions are always free.	○	○

Inbound data transfers to Azure datacenters are generally free, but outbound data transfers (egress) and cross-region data transfers (such as traffic traversing global VNet peering or inter-region replication) incur bandwidth and data egress charges. They are not free.

Answer:

Answer Area

Statements	Yes	No
North America is represented by a single Azure region.	○	○
Every Azure region has multiple datacenters.	○	○
Data transfers between Azure services located in different Azure regions are always free.	○	○

Explanation:

Box 1: No -

North America has several Azure regions, including West US, Central US, South Central US, East Us, and Canada East.

Box 2: No

A region is a geographical area on the planet that contains at least one, but potentially multiple datacenters that are nearby and networked together with a low-latency network. Azure intelligently assigns and controls the resources within each region to ensure workloads are appropriately balanced.

Box 3: No -

Outbound data transfer is charged at the normal rate and inbound data transfer is free.

Reference:

https://www.pragimtech.com/blog/azure/azure-regions-and-paired-regions/

Question: 122 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct

solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more scale sets.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

An availability set is a logical grouping of VMs within a datacenter. You will have to use availability zones. Hence B answer.

This answer does not specify that the scale set will be configured across multiple data centers so this solution does not meet the goal.

Azure virtual machine scale sets let you create and manage a group of load balanced VMs. The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. Scale sets provide high availability to your applications, and allow you to centrally manage, configure, and update many VMs.

Virtual machines in a scale set can be deployed across multiple update domains and fault domains to maximize availability and resilience to outages due to data center outages, and planned or unplanned maintenance events.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/availability

Question: 123 CertyIQ

You need to be notified when Microsoft plans to perform maintenance that can affect the resources deployed to an Azure subscription.
What should you use?

A. Azure Monitor
B. Azure Service Health
C. Azure Advisor
D. Microsoft Trust Center

Azure Service Health provides personalized guidance and support when Azure service issues, outages, planned maintenance events, or health advisories affect your specific Azure subscriptions and deployed resources.

It includes:
Azure Status: Global view of the health of Azure services across all regions.

Service Health: Personalized dashboard tracking issues affecting your specific services and subscriptions.

Resource Health: Detailed diagnostics on the health of individual resource instances (e.g., a specific VM instance).

Planned Maintenance: Advanced warnings and scheduling for maintenance windows that Microsoft performs on underlying hardware and infrastructure.

Answer: B

Explanation:

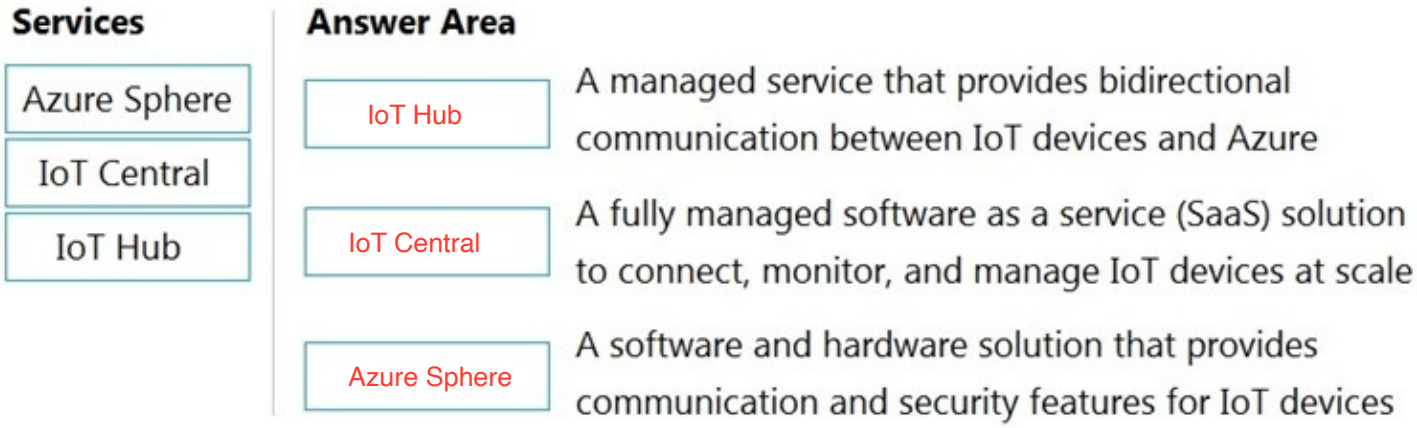
Azure Service Health provides a personalized view of the health of the Azure services and regions you're using. This is the best place to look for service impacting communications about outages, planned maintenance activities, and other health advisories because the authenticated Service Health experience knows which services and resources you currently use.

Reference:

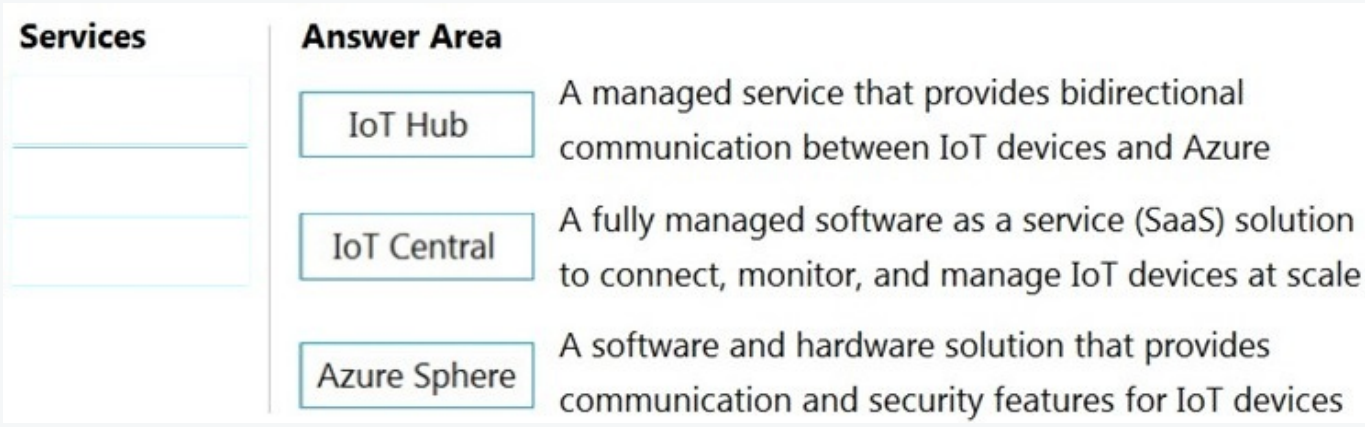
https://docs.microsoft.com/en-us/azure/service-health/overview

Question: 124 CertyIQ

DRAG DROP -
Match the Azure Services service to the correct description.
Instructions: To answer, drag the appropriate service from the column on the left to its description on the right.
Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:



Answer:



Explanation:

1. IoT Hub $\rightarrow$ A managed service that provides bidirectional communication between IoT devices and Azure Azure IoT Hub is a core Platform as a Service (PaaS) offering that acts as a central message hub for secure, bi-directional communication between millions of IoT devices and a cloud backend.Key Context: It supports data ingestion from devices to the cloud (telemetry) as well as command-and-control messaging from the cloud back down to specific devices. It serves as the underlying engineering foundation for more complex IoT architectures.

2. IoT Central $\rightarrow$ A fully managed software as a service (SaaS) solution to connect, monitor, and manage IoT devices at scale : Azure IoT Central simplifies the deployment process by offering an out-of-the-box, web-based SaaS dashboard interface.Key Context: Unlike IoT Hub (which requires you to write custom code and connect separate data stream services manually), IoT Central provides built-in industry templates, ready-made monitoring dashboards, and rules engines. It is designed for organizations that want to connect and manage devices at scale without needing deep cloud architecture or backend development expertise.

3. Azure Sphere $\rightarrow$ A software and hardware solution that provides communication and security

features for IoT devices Azure Sphere is an end-to-end, high-security ecosystem specifically engineered to protect internet-connected microcontrollers (MCUs) from digital and physical threats.Key Context: It is unique because it spans three distinct components:Hardware: Certified hardware chips (secure MCUs) built by silicon partners.Software: A custom, highly secured, defense-in-depth Linux-based operating system designed by Microsoft.Cloud Service: The Azure Sphere Security Service, which continuously monitors connected devices for emerging threats, handles secure certificate-based authentication, and deploys verified software updates.

Reference:

https://docs.microsoft.com/en-us/azure-sphere/product-overview/what-is-azure-sphere https://docs.microsoft.com/en-us/azure/iot-central/core/overview-iot-central https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub

Question: 125 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Session hosts in Azure Virtual Desktop (formerly Windows Virtual Desktop) are not restricted to Windows 10. They support multiple operating systems, including Windows 11 Enterprise multi-session, Windows 10 Enterprise multi-session, Windows Server (2012 R2, 2016, 2019, 2022), and single-session Windows client images.

Statements	Yes	No
A Windows Virtual Desktop session host can run Windows 10 only.	○	○
A Windows Virtual Desktop host pool that includes 20 session hosts supports a maximum of 20 simultaneous user connections.	○	○
Windows Virtual Desktop supports desktop and app virtualization.	○	○

Answer:

Azure Virtual Desktop supports Windows 10/11 Enterprise multi-session, which allows multiple concurrent users to sign in and run workloads on a single virtual machine host simultaneously. A host pool with 20 session hosts using multi-session configurations can easily support hundreds of concurrent user sessions, depending on VM compute sizing and workload limits.

Answer Area

Azure Virtual Desktop: It can deliver full desktop experiences (personal or pooled desktops) as well as publish individual virtualized applications (RemoteApp) to end-user devices.

Statements	Yes	No
A Windows Virtual Desktop session host can run Windows 10 only.	○	○
A Windows Virtual Desktop host pool that includes 20 session hosts supports a maximum of 20 simultaneous user connections.	○	○
Windows Virtual Desktop supports desktop and app virtualization.	○	○

Explanation:

1. NO - Supported O/Ses are Windows 10 Enterprise multi-session or Windows 10 Enterprise, Windows 7 Enterprise, Windows Server 2012 R2, 2016, 2019. See https://docs.microsoft.com/en-us/azure/virtual-desktop/overview#requirements

2. NO - For Max session limit, enter the maximum number of users you want load-balanced to a single session host. See https://docs.microsoft.com/en-us/azure/virtual-desktop/create-host-pools-azure-

marketplace#begin-the-host-pool-setup-process and https://docs.microsoft.com/en-us/windows-server/remote/remote-desktop-services/virtual-machine-recs?context=/azure/virtual-desktop/context/context#recommended-vm-sizes-for-standard-or-larger-environments

3. YES- Via RemoteApps See https://docs.microsoft.com/en-us/azure/virtual-desktop/manage-app-groups

Reference:

https://docs.microsoft.com/en-us/azure/virtual-desktop/overview

Question: 126 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Question: 127 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

An Availability Zone is physically separated into one or more distinct datacenters with independent power, cooling, and networking within an Azure region. Deploying virtual machines across multiple Availability Zones ensures that if an entire datacenter facility fails, virtual machine instances running in another zone continue to operate.

Statements	Yes	No
You can use Availability Zones in Azure to protect Azure virtual machines from a datacenter failure.	○	○
You can use Availability Zones in Azure to protect Azure virtual machines from a region failure.	○	○
You can use Availability Zones in Azure to protect Azure managed disks from a datacenter failure.	○	○

Answer:

Azure Managed Disks offer Zone-Redundant Storage (ZRS) options. A ZRS managed disk synchronously replicates data across three separate Availability Zones within the primary region. Even for standard locally zoned disks attached to zonal VMs, spreading managed disks across availability zones shields the underlying storage and data workloads from the physical failure of an individual datacenter.

Answer Area

Statements	Yes	No
You can use Availability Zones in Azure to protect Azure virtual machines from a datacenter failure.	○	○
You can use Availability Zones in Azure to protect Azure virtual machines from a region failure.	○	○
You can use Availability Zones in Azure to protect Azure managed disks from a datacenter failure.	○	○

Explanation:

Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. Availability Zones are unique physical locations within an Azure region. Each zone is made up of one or more datacenters equipped with independent power, cooling, and networking. To ensure resiliency, there are a minimum of three separate zones in all enabled regions. The physical separation of Availability Zones within a region protects applications and data from datacenter failures.

With Availability Zones, Azure offers industry best 99.99% VM uptime SLA. By architecting your solutions to use replicated VMs in zones, you can protect your applications and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

https://docs.microsoft.com/en-us/azure/virtual-machines/windows/manage-availability

Question: 128 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
An Azure subscription can have multiple account administrators	○	○
An Azure subscription can be managed by using a Microsoft account only	○	○
An Azure resource group can contain multiple Azure subscriptions	○	○

Answer:

Answer Area

Statements	Yes	No
An Azure subscription can have multiple account administrators	○	○
An Azure subscription can be managed by using a Microsoft account only	○	○
An Azure resource group can contain multiple Azure subscriptions	○	○

Explanation:

Box 1 : No

You can assign service administrators and co-administrators in the Azure Portal but there can only be one account administrator.

Box2:No

Azure subscriptions can be managed using both:

Microsoft accounts (e.g., personal accounts like Outlook/Hotmail).

Azure Active Directory (AAD) accounts, which are organizational accounts.

Limiting management to only Microsoft accounts is incorrect.

Box 3 : No

A resource group in Azure is a logical container that organizes resources within a single subscription.

You cannot have resources from multiple subscriptions within the same resource group.

Question: 129 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

An Azure region

- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Answer:

Answer Area

An Azure region

- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Explanation:
A region is a set of data centres deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network.
Microsoft Azure currently has 55 regions worldwide.
Regions are divided into Availability Zones. Availability Zones are physically separate locations within an Azure region. Each Availability Zone is made up of one or more datacenters equipped with independent power, cooling, and networking.

Reference:
https://azure.microsoft.com/en-gb/global-infrastructure/regions/

Question: 130 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Answer Area

Statements	Yes	No
To use Azure Active Directory (Azure AD) credentials to sign in to a computer that runs Windows 10, the computer must be joined to Azure AD.	○	○
Users in Azure Active Directory (Azure AD) are organized by using resource groups.	○	○
Azure Active Directory (Azure AD) groups support dynamic membership rules.	○	○

Answer:

Answer Area

Statements	Yes	No
To use Azure Active Directory (Azure AD) credentials to sign in to a computer that runs Windows 10, the computer must be joined to Azure AD.	○	○
Users in Azure Active Directory (Azure AD) are organized by using resource groups.	○	○
Azure Active Directory (Azure AD) groups support dynamic membership rules.	○	○

Explanation:

Statement 1: To use Azure Active Directory (Azure AD) credentials to sign in to a computer that runs Windows 10, the computer must be joined to Azure AD.

Answer: Yes

Explanation: For a local client operating system (like Windows 10 or Windows 11) to natively trust, evaluate, and accept cloud-based identity credentials at the login screen, the device itself must establish a formal trust relationship with the identity directory. This is achieved by performing an Azure AD Join (or Hybrid Azure AD Join), which registers the hardware object into the tenant and allows users to log into the desktop using their corporate organizational cloud credentials.

Statement 2: Users in Azure Active Directory (Azure AD) are organized by using resource groups.

Answer: No

Explanation: This statement mixes up two completely separate Azure architectural boundaries:

Resource Groups are strictly logical deployment containers used to organize, manage, secure, and lifecycle physical infrastructure components (like virtual machines, virtual networks, and databases) within an Azure Subscription.

Azure AD (Microsoft Entra ID) identity objects are organized hierarchically using Administrative Units (AUs), security groups, or nested organizational configurations. Resource groups have no role in structuring directory users.

Statement 3: Azure Active Directory (Azure AD) groups support dynamic membership rules.

Answer: Yes

Explanation: Azure AD supports Dynamic Groups, which automate group membership management based on user attributes. Instead of manually adding or removing members, administrators write a conditional query rule (e.g., user.department -eq "Sales" or user.jobTitle -contains "Manager"). The identity system continuously evaluates user accounts against this expression and automatically provisions or de-provisions users from the group as their corporate profile details change.

Reference:

https://docs.microsoft.com/en-us/azure/active-directory/enterprise-users/groups-dynamic-membership
https://petri.com/understanding-hybrid-azure-active-directory-join

Question: 131 CertyIQ

You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines remain available if a single data center fails.
What are two possible solutions? Each correct answer presents a complete solution.

A. Deploy the virtual machines to two or more availability zones.
B. Deploy the virtual machines to two or more resource groups.
C. Deploy the virtual machines to a scale set.
D. Deploy the virtual machines to two or more regions.

Answer: AD

Explanation:

A. Deploy the virtual machines to two or more availability zones (Correct): An Azure Availability Zone is a unique physical location within an Azure region. Each zone is made up of one or more data centers equipped with independent power, cooling, and networking infrastructure. By distributing your VMs across multiple availability zones (e.g., Zone 1, Zone 2), if one data center or an entire zone goes down due to a power outage or infrastructure failure, your VMs running in the other zone(s) continue to remain available.

D. Deploy the virtual machines to two or more regions (Correct):

An Azure Region is a set of data centers deployed within a latency-defined perimeter and connected through a dedicated regional low-latency network. By deploying virtual machines to separate regions (e.g., East US and West US), you are separating your infrastructure by hundreds of miles. If an entire region suffers a catastrophic data center failure, power grid failure, or natural disaster, the workloads running in the secondary region will keep your services available.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/overview https://docs.microsoft.com/en-us/azure/virtual-machines/windows/regions

Question: 132 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

be deployed to a separate virtual network.
run a different operating system than the other virtual machines.
be deployed to a separate resource group.
have two network interfaces.

Answer:

Answer Area

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

be deployed to a separate virtual network.
run a different operating system than the other virtual machines.
be deployed to a separate resource group.
have two network interfaces.

Explanation:
Azure automatically routes traffic between subnets in a virtual network. Therefore, all virtual machines in a virtual network can connect to the other virtual machines in the same virtual network. Even if the virtual machines are on separate subnets within the virtual network, they can still communicate with each other. To ensure that a virtual machine cannot connect to the other virtual machines, the virtual machine must be deployed to a separate virtual network.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-udr-overview

Question: 133 CertyIQ

DRAG DROP -
Match the Azure service to the appropriate description.
To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Services	Answer Area	
Azure Cosmos DB	Azure Synapse Analytics	A fully managed data warehouse that has integral security at every level of scale at no extra cost.
Azure HDInsight	Azure Cosmos DB	A globally distributed database that supports NoSQL.
Azure Synapse Analytics	Azure HDInsight	Managed Apache Hadoop clusters in the cloud that enable you to process massive amounts of data.

Answer:

Services	Answer Area	
	Azure Synapse Analytics	A fully managed data warehouse that has integral security at every level of scale at no extra cost.
	Azure Cosmos DB	A globally distributed database that supports NoSQL.
	Azure HDInsight	Managed Apache Hadoop clusters in the cloud that enable you to process massive amounts of data.

Explanation:

azure synapse analytics = Warehouse

Azure cosmos = even larger than the globe (global) : cosmos

Azure HDInsight = HaDoop

Azure synapse analytics used to be called Azure SQL Data Warehouse

https://azure.microsoft.com/en-us/blog/azure-sql-data-warehouse-is-now-azure-synapse-analytics/

Azure cosmos is the only database that supports NoSQL.

https://www.sqlshack.com/learn-nosql-in-azure-an-overview-of-azure-cosmos-db/

Azure HDInsight :

https://docs.microsoft.com/en-us/azure/hdinsight/hdinsight-hadoop-provision-linux-clusters

Question: 134

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The Archive access tier is set at the storage account level.	○	○
The Hot access tier is recommended for data that is accessed and modified frequently.	○	○
The Cool access tier is recommended for long term backups.	○	○

Answer:

Statement 1 (No): Default access tiers set at the storage account level can only be configured as Hot or Cool (and in newer accounts, Cold). The Archive tier cannot be set as the default access tier for an entire storage account; it is strictly an offline tier set at the individual blob level (or managed via Blob Lifecycle Management rules).

Statement 2 (Yes): The Hot access tier is optimized for data that is actively in use, frequently read, and frequently modified. It features the lowest access and transaction costs, balanced against higher storage capacity costs compared to cooler tiers.

Statement 3 (No): The Archive access tier is the recommended tier for long-term backups, secondary archival, and compliance records that are rarely accessed and can tolerate hours of retrieval latency. The Cool tier is intended for short-term backup or infrequently accessed data that is retained for at least 30 days, whereas long-term/permanent archival belongs in the Archive tier.

Answer Area

Statements	Yes	No
The Archive access tier is set at the storage account level.	○	●
The Hot access tier is recommended for data that is accessed and modified frequently.	●	○
The Cool access tier is recommended for long term backups.	○	●

Explanation:

Box 1: NO.

from Azure document: "Only the hot and cool access tiers can be set at the account level. The archive access tier can only be set at the blob level."

Please see: https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers

Box 2: Yes -

Usage scenarios for the hot access tier include:

- Data that is in active use or is expected to be read from and written to frequently
- Data that is staged for processing and eventual migration to the cool access tier

Box 3: No -

Usage scenarios for the cool access tier include:

- Short-term backup and disaster recovery
- Older data not used frequently but expected to be available immediately when accessed

Large data sets that need to be stored cost effectively, while more data is being gathered for future processing

Reference:

https://docs.microsoft.com/en-us/azure/storage/blobs/storage-blob-storage-tiers

Question: 135 CertyIQ

What is the most severe failure from which an Azure Availability Zone can be used to protect access to Azure service?

A. a physical server failure
B. an Azure region failure
C. a storage failure
D. an Azure data center failure

Answer: D

Explanation:
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.
Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/availability

Question: 136 CertyIQ

You need to purchase a third-party virtual security appliance that you will deploy to an Azure subscription.
What should you use?

A. Azure subscriptions
B. Azure Security Center
C. Azure Marketplace
D. Microsoft Store

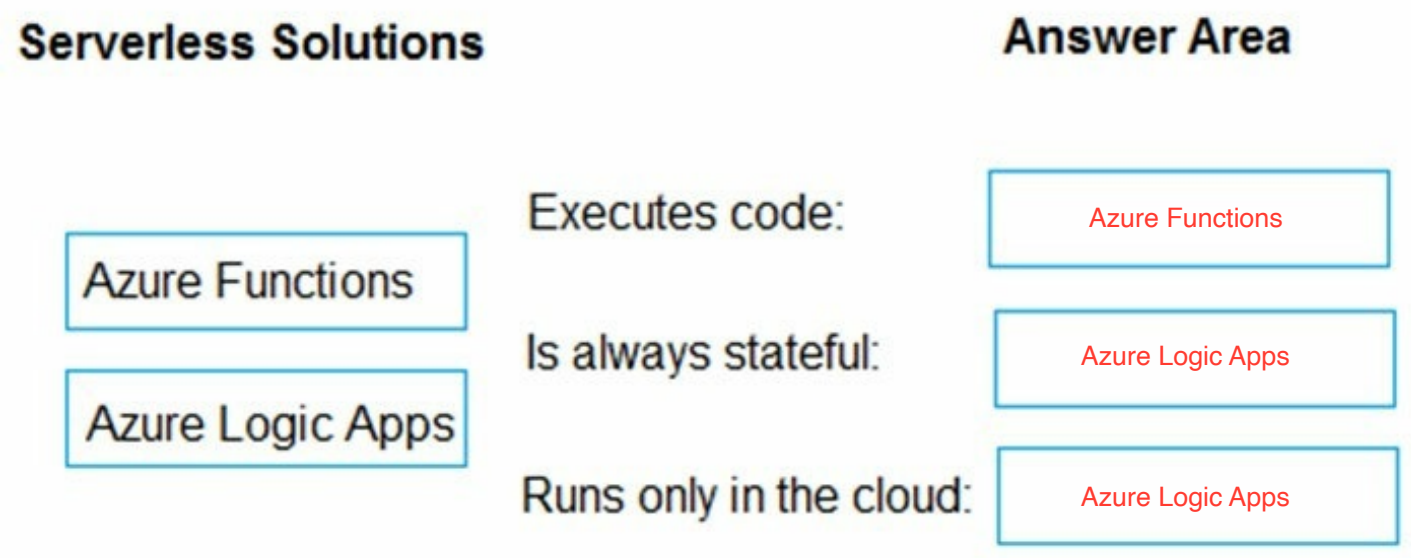
Answer: C

Explanation:

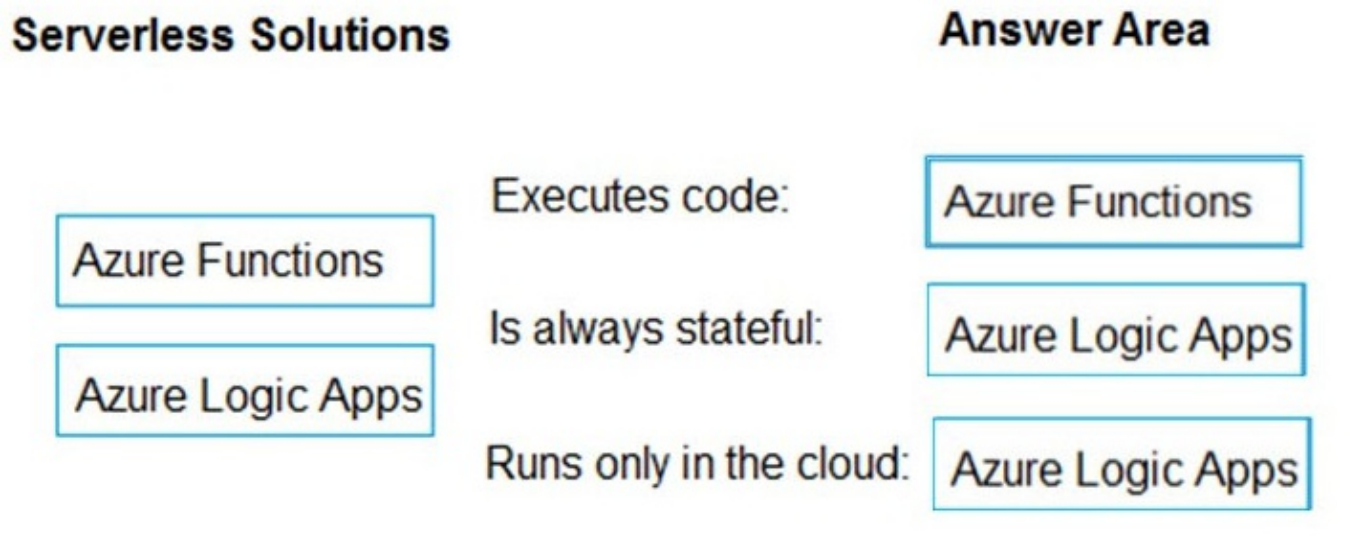
Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/ea-azure-marketplace

Question: 137 CertyIQ

DRAG DROP -
Match the serverless solution to the correct characteristic.
To answer, drag the appropriate serverless solution from the column on the left to its characteristic on the right.
Each serverless solution may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Box 1: Azure Functions .

Azure Functions allows you to implement your system's logic into readily available blocks of code called "functions". Different functions can run anytime you need to respond to critical events.

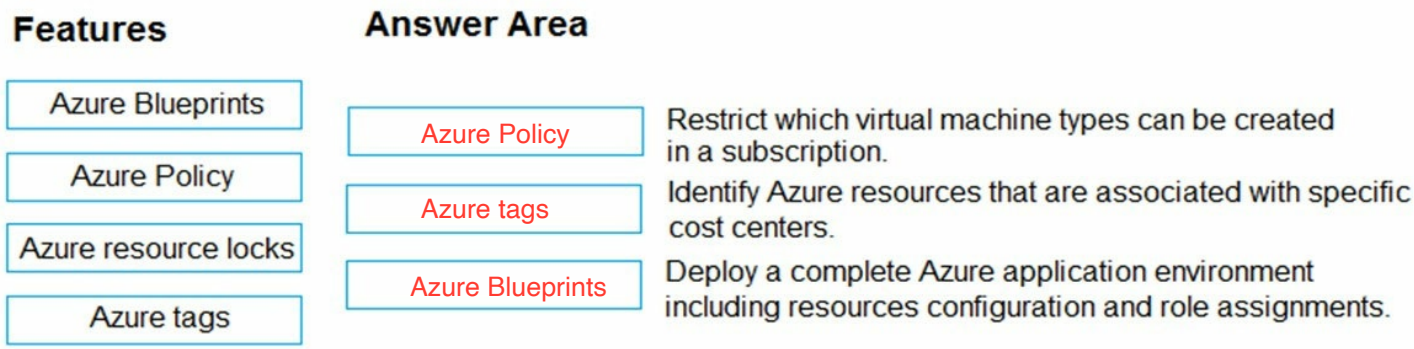
Box 2: Azure Logic Apps.

Box 3: Azure Logic Apps -

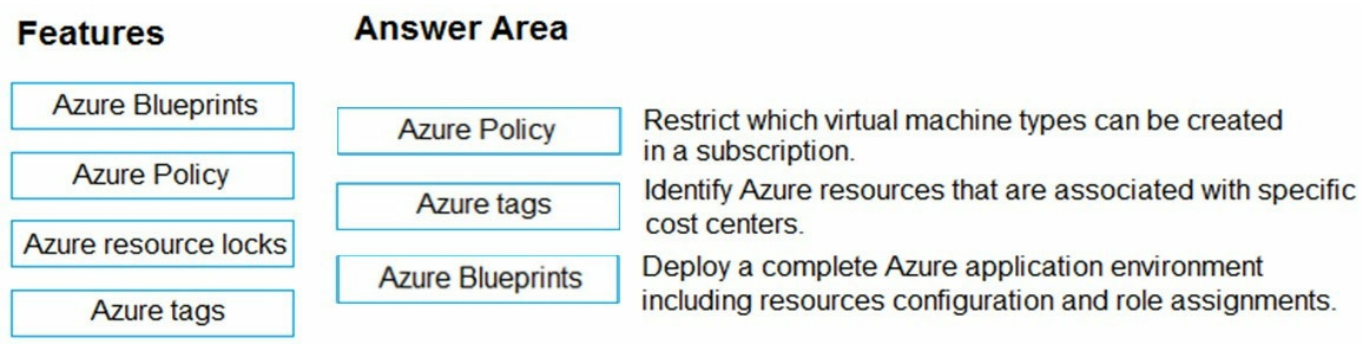
Azure Logic Apps is a cloud-based platform for creating and running automated workflows that integrate your apps, data, services, and systems.

Question: 138 CertyIQ

DRAG DROP -
Match the Azure governance feature to the correct description.
Instructions: To answer, drag the appropriate feature from the column on the left to its description on the right.
Each feature may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

1. Azure Policy $\rightarrow$ Restrict which virtual machine types can be created in a subscription.Explanation: Azure Policy is a governance tool used to create, assign, and manage policies that enforce rules over your corporate resources.Key Context: It dynamically evaluates your resource properties during a deployment against specified compliance rules. A classic, standard use case is assigning an internal policy that restricts or blocks the deployment of expensive or massive virtual machine stock keeping units (SKUs) (e.g., allowing only "D-series" VMs) to tightly control cost baselines within a specific development subscription.2. Azure tags $\rightarrow$ Identify Azure resources that are associated with specific cost centers.Explanation: Azure tags are simple metadata elements applied directly to your cloud resources consisting of a user-defined key-value pair (for example, Key: CostCenter and Value: Finance-01).Key Context: Tags allow you to categorize and organize your resources logically outside of the strict, structural subscription or resource group hierarchy. They are crucial for complex corporate cost allocation, chargeback mechanisms, and billing aggregation inside Microsoft Cost Management.3. Azure Blueprints $\rightarrow$ Deploy a complete Azure application environment including resources configuration and role assignments.Explanation: Azure Blueprints allows cloud architects to define a repeatable, orchestratable set of Azure artifacts that comply with an organization's standards, patterns, and requirements.Key Context: While infrastructure-as-code tools (like ARM templates) focus purely on deploying specific resources, a blueprint packages multiple foundational components together in a single package. It can orchestrate the simultaneous deployment of:Role Assignments (RBAC settings for teams)Policy Assignments (governance constraints)ARM Templates (the physical compute, network, or storage resources)Resource Groups (the foundational containers)

Reference:

https://docs.microsoft.com/en-us/azure/governance/blueprints/overview https://docs.microsoft.com/en-us/azure/governance/policy/overview https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources?tabs=json https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/lock-resources?tabs=json

Question: 139 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Availability Zone in Azure has physically separate locations

- across two continents
- within a single Azure region
- within multiple Azure regions
- within a single Azure datacenter

Answer:

Answer Area

An Availability Zone in Azure has physically separate locations

- across two continents
- within a single Azure region
- within multiple Azure regions
- within a single Azure datacenter

Explanation:

Box: within a single Azure region

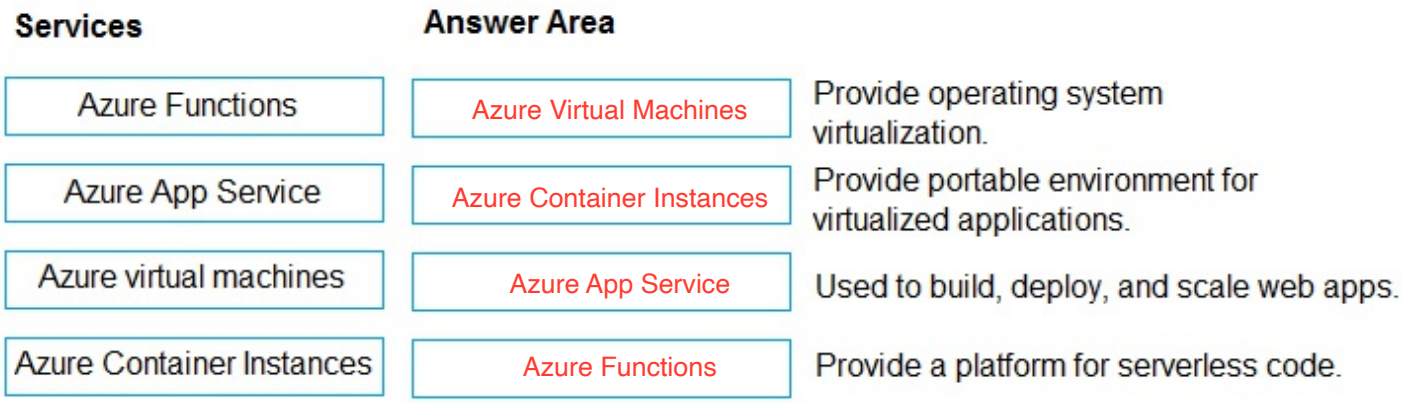
Azure availability zones are physically separate locations within each Azure region that are tolerant to local failures.

Reference:

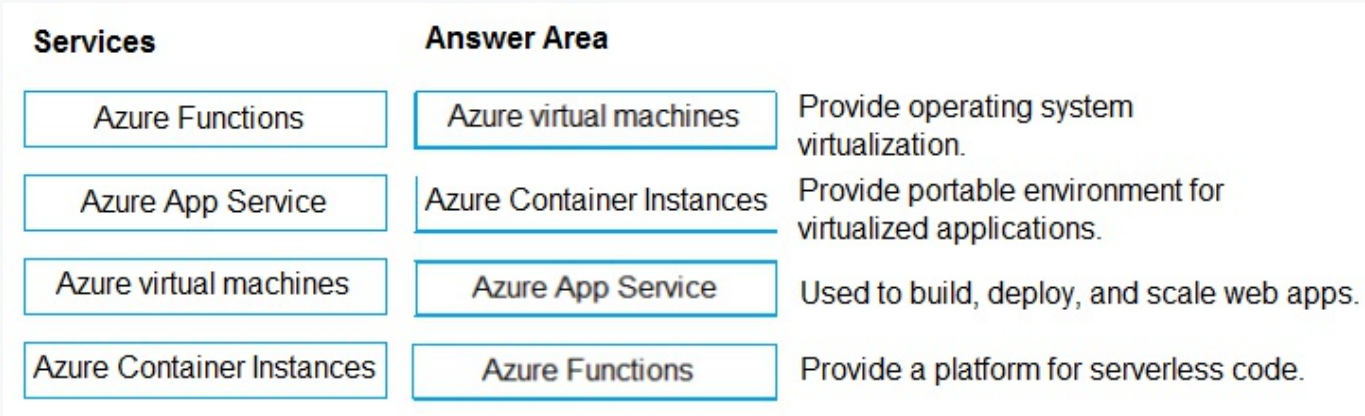
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 140 CertyIQ

DRAG DROP -
Match the Azure services to the correct descriptions.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:
Box 1: Azure virtual machines -
Box 2: Azure Container instances
Azure Container Instances (ACI) is a managed service that allows you to run containers directly on the Microsoft Azure public cloud, without requiring the use of virtual machines (VMs).
Develop apps fast without managing virtual machines or having to learn new tools"it's just your application, in a container, running in the cloud.

Box 3: Azure App Service -
Azure App Service is a fully managed platform for building web applications.
Applications run and scale with ease on both Windows and Linux-based environments.

Box 4: Azure Functions -
Azure Functions (from Microsoft Azure) is a cloud-based serverless service that allows running event-triggered code in a scalable way without providing or managing infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/container-instances
https://azure.microsoft.com/en-us/services/app-service/

https://revdebug.com/blog/what-are-azure-functions

Question: 141 CertyIQ

HOTSPOT -
To answer, select the appropriate option in the answer area.
Hot Area:

Answer Area

You have several virtual machines in an Azure subscription. You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2019.

Answer:

Answer Area

You have several virtual machines in an Azure subscription. You create a new subscription.

The virtual machines cannot be moved to the new subscription.
The virtual machines can be moved to the new subscription.
The virtual machines can be moved to the new subscription only if they are all in the same resource group.
The virtual machines can be moved to the new subscription only if they run Windows Server 2019.

Explanation:
Box: The virtual machines can be moved to the new subscription.
You can move a VM and its associated resources to a different subscription by using the Azure portal.
Note: Repeat the process below for each Resource Group containing the VMs.
1. Go to the Azure portal to manage the resource group containing the VM to move. Search for and select Resource groups.
2. Choose the resource group containing the VM that you would like to move.
3. At the top of the page for the resource group, select Move and then select Move to another subscription. The Move resources page opens.
4. Select each of the resources to move. In most cases, you should move all of the related resources that are listed.
5. Select the Subscription where you want the VM to be moved.
6. Select an existing Resource group, or enter a name to have a new resource group created.
7. When you are done, select that you understand that new resource IDs will be created and that the new IDs will need to be used with the VM after it is moved, and then select OK.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/move-vm

Question: 142 CertyIQ

You need to purchase a third-party virtual security appliance that you will deploy to an Azure subscription. What should you use?

A. Azure subscriptions
B. Microsoft Defender for Cloud
C. Azure Marketplace
D. Microsoft Store

Answer: C

Explanation:
You can access these enhanced network security features by using an Azure partner solution. You can find the most current Azure partner network security solutions by visiting the Azure Marketplace, and searching for "security" and "network security."
Some third-party reseller services available on Azure Marketplace now consume your Enterprise Agreement (EA) Azure Prepayment balance.

Reference:
https://docs.microsoft.com/en-us/azure/security/fundamentals/network-overview
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/ea-azure-marketplace

Question: 143 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure Sphere is an end-to-end security solution designed specifically for connected Internet of Things (IoT) devices. It is uniquely composed of three tightly coupled components:

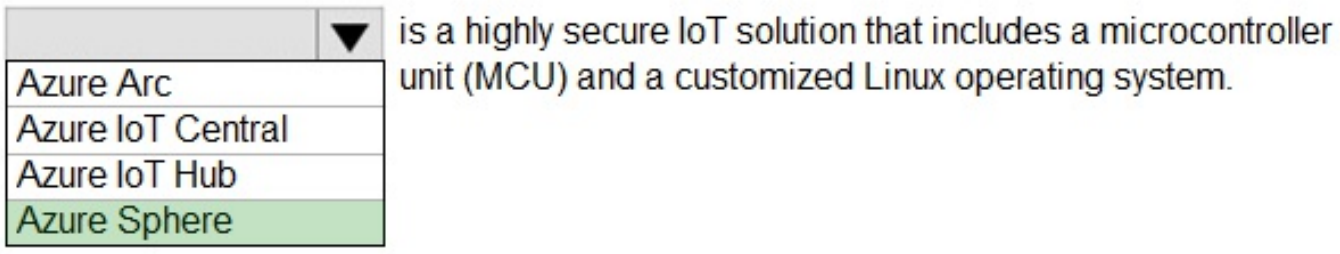
Secured silicon: Certified, cross-over microcontroller units (MCUs) with built-in Microsoft Pluton security subsystems.

Answer:

Secured operating system: A purpose-built, highly tuned custom Linux-based OS (Azure Sphere OS) with layered defense-in-depth architecture.

Answer Area

Cloud security service: The Azure Sphere Security Service (AS3), which brokers trust, validates device integrity via certificate authentication, and delivers automated, secure OS/application updates for over a decade.



Explanation:

Microsoft's Azure Sphere hardware and service designed to better secure Internet of Things (IoT) devices. Azure Sphere consists of Microsoft-certified microcontrollers " single-chip computers with processors, storage, memory and IoT capabilities " plus the Azure
Sphere Linux-based OS and the Azure Sphere cloud security service.

Reference:
https://www.zdnet.com/article/microsofts-azure-sphere-its-linux-based-microcontroller-plus-cloud-service-hits-general-availability/

Question: 144 CertyIQ

You plan to deploy a service to Azure virtual machines.
You need to ensure that the service will be available if a datacenter fails.
What should you use as part of the virtual machine deployment?

A. availability sets
B. proximity placement groups
C. host groups
D. availability zones

Answer: D

Explanation:
Azure availability zones are physically separate locations within each Azure region that are tolerant to local failures. Failures can range from software and hardware failures to events such as earthquakes, floods, and fires. Tolerance to failures is achieved because of redundancy and logical isolation of Azure services. To ensure resiliency, a minimum of three separate availability zones are present in all availability zone-enabled regions.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 145 CertyIQ

Your company has an Azure subscription that contains resources in several regions.
You need to ensure that administrators can only create resources in those regions.
What should you use?

A. a read-only lock
B. an Azure policy
C. a management group
D. a reservation

Answer:

B

Explanation:

Policy is correct.

reference:

https://learn.microsoft.com/en-us/azure/governance/management-groups/overview

"For example, you can apply policies to a management group that limits the regions available for virtual machine (VM) creation. This policy would be applied to all nested management groups, subscriptions, and resources, and allow VM creation only in authorized regions.

Question: 146 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Azure region
- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Answer:

Answer Area

An Azure region
- contains one or more data centers that are connected by using a low-latency network.
- is found in each country where Microsoft has a subsidiary office.
- can be found in every country in Europe and the Americas only.
- contains one or more data centers that are connected by using a high-latency network.

Explanation:
Box: contains one or more data centers that are connected by using a low-latency network.
Each Azure region features datacenters deployed within a latency-defined perimeter. They're connected through a dedicated regional low-latency network. This design ensures that Azure services within any region offer the best possible performance and security.

Reference:
https://docs.microsoft.com/en-us/azure/availability-zones/az-overview

Question: 147 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can use the Azure File Sync agent to sync on-premises data to an Azure

- blob container.
- Data Lake Storage container.
- file share.
- queue.

Azure File Sync allows organizations to centralize file shares in Azure Files (an Azure file share) while preserving the local compatibility, access latency, and caching benefits of an on-premises Windows Server.

The Azure File Sync agent is installed directly on an on-premises Windows Server to establish a sync relationship between a local folder (Server Endpoint) and an Azure file share (Cloud Endpoint).

Answer:

It also provides cloud tiering, automatically keeping frequently accessed files cached locally while tiering infrequently accessed files to the Azure file share in the cloud.

Answer Area

You can use the Azure File Sync agent to sync on-premises data to an Azure

- blob container.
- Data Lake Storage container.
- file share.
- queue.

Explanation:

The Azure File Sync agent enables data on a Windows Server to be synchronized with an Azure File share.

Reference:

https://www.microsoft.com/en-us/download/details.aspx?id=57159

Question: 148

CertyIQ

What is the function of a Site-to-Site VPN?

A. provides a secure connection between a computer on a public network and the corporate network

B. provides a dedicated private connection to Azure that does NOT travel over the internet

C. provides a connection from an on-premises VPN device to an Azure VPN gateway

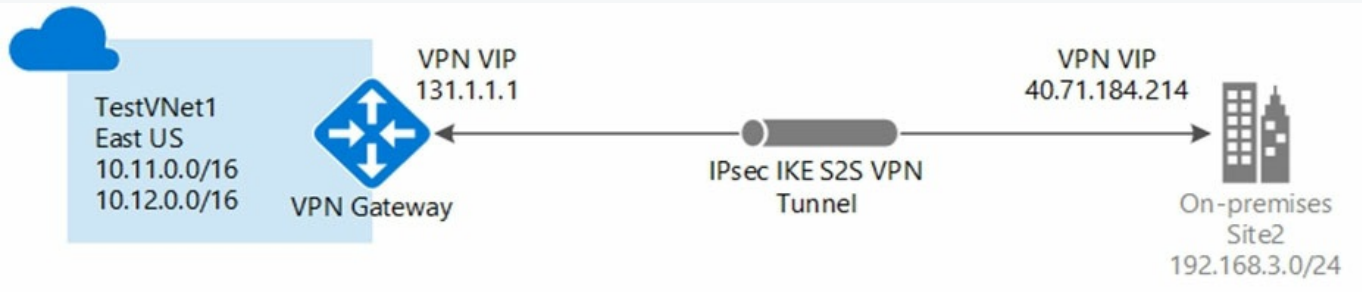
Answer: C

Explanation:

A Site-to-Site VPN gateway connection is used to connect your on-premises network to an Azure virtual network over an IPsec/IKE (IKEv1 or IKEv2) VPN tunnel.

This type of connection requires a VPN device located on-premises that has an externally facing public IP address assigned to it.

Example:

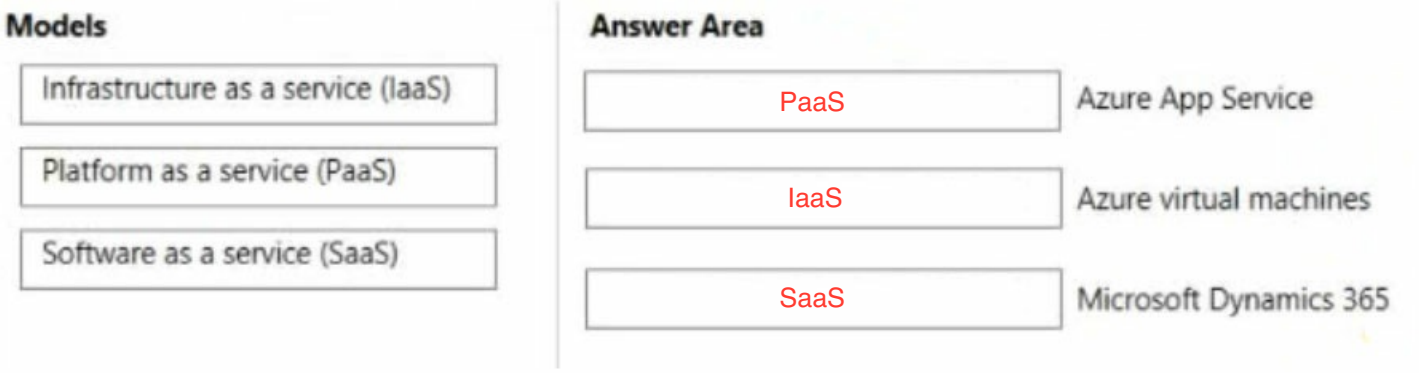


Reference:

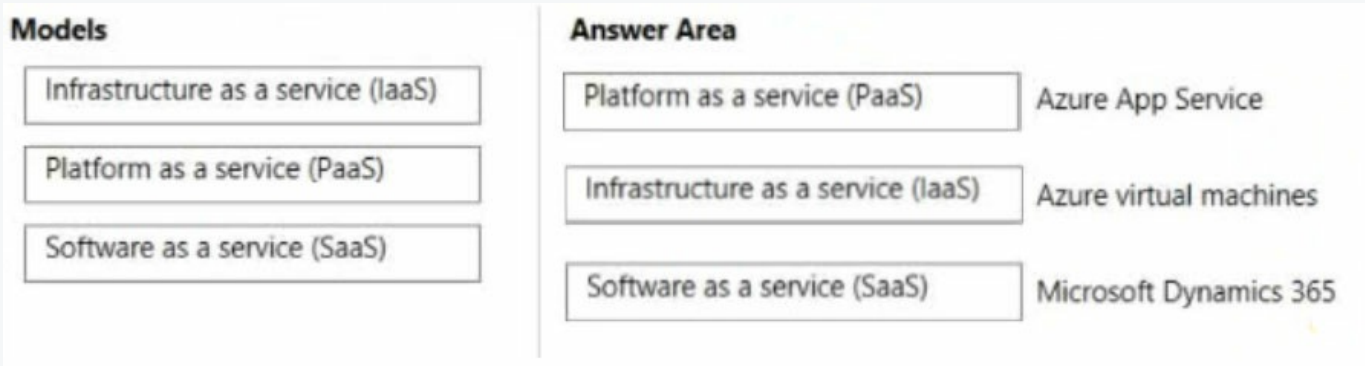
https://docs.microsoft.com/en-us/azure/vpn-gateway/vpn-gateway-howto-site-to-site-classic-portal

Question: 149 CertyIQ

DRAG DROP -
Match the cloud service models to the appropriate offerings.
To answer, drag the appropriate model from the column on the left to its offering on the right. Each model may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



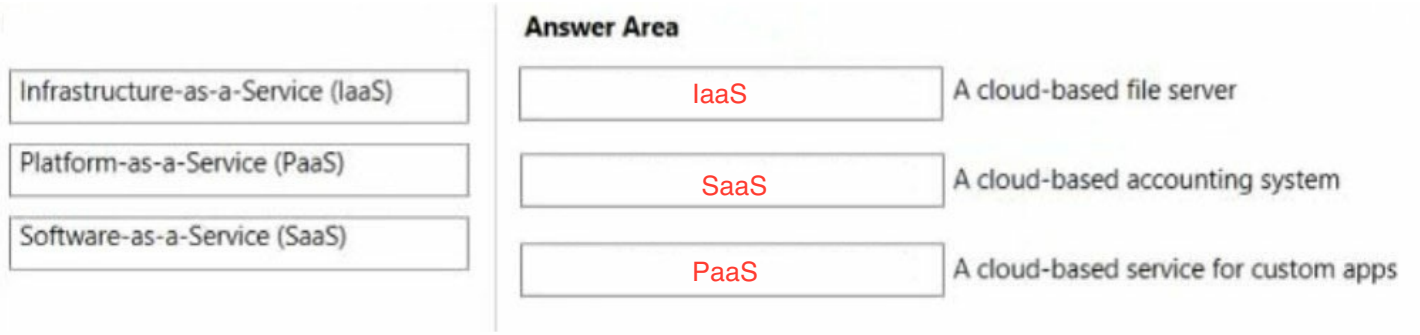
Explanation:
Box 1: Platform as a service (PaaS)
Azure App Service is a fully managed platform for building web applications.
Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications.
Box 2: Infrastructure as a service (IaaS)
Windows Azure Virtual Machines, an Infrastructure-as-a-Service (IaaS) offering in Windows Azure, was released back in 2012.
Box 3: Software as a service (SaaS)
Dynamics 365 is a set of interconnected, modular Software-as-a-Service (SaaS) applications and services designed to both transform and enable your core customers, employees, and business activities.

Reference:
https://azure.microsoft.com/en-us/overview/what-is-paas/
https://azure.microsoft.com/en-us/blog/infrastructure-as-a-service-series-virtual-machines-and-windows/
https://pipol.com/what-is-microsoft-dynamics-365

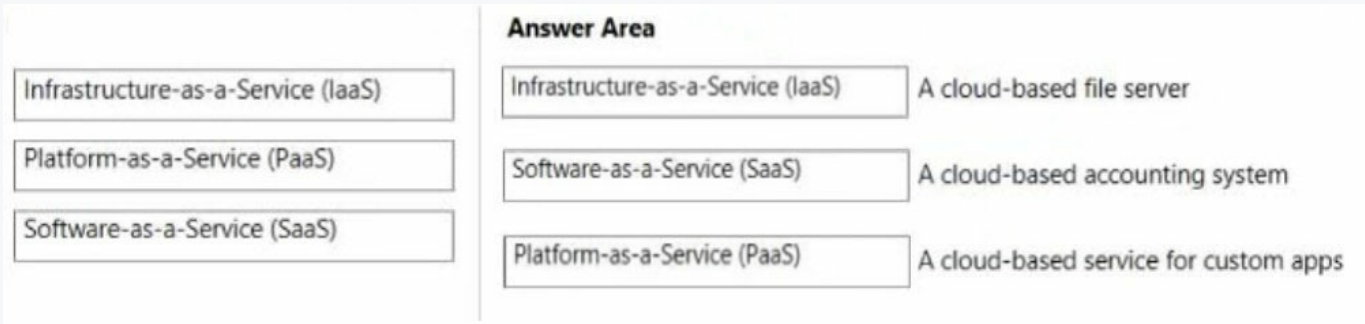
Question: 150 CertyIQ

DRAG DROP -

Match the cloud service models to the appropriate solutions.
To answer, drag the appropriate cloud service model from the column on the left to its solution on the right Each cloud service model may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:
Box 1: Infrastructure as a service (IaaS)
Azure Files is a simple, secure, and serverless enterprise-grade cloud file shares.
Infrastructure as a service (IaaS) is a type of cloud computing service that offers essential compute, storage, and networking resources on demand, on a pay-as- you-go basis.
Box 2: Software as a service (SaaS)
Dynamics 365 is a set of interconnected, modular Software-as-a-Service (SaaS) applications and services designed to both transform and enable your core customers, employees, and business activities. It includes Dynamics 365 Finance: use the guided, rules-based chart of accounts and no-code configuration service to simplify regulatory reporting, electronic invoicing, and global payments.
Box 3: Platform as a service (PaaS)
Platform as a service (PaaS) is a complete development and deployment environment in the cloud, with resources that enable you to deliver everything from simple cloud-based apps to sophisticated, cloud-enabled enterprise applications.

Reference:
https://azure.microsoft.com/en-us/overview/what-is-iaas
https://azure.microsoft.com/en-us/overview/what-is-paas/

Question: 151 CertyIQ

You need to manage containers.
Which two services can you use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Azure Virtual Desktop
B. Azure virtual machines
C. Azure Functions
D. Azure Container Instances

E. Azure Kubernetes Service (AKS)

Answer: DE

Explanation:
Run Docker containers on-demand in a managed, serverless Azure environment. Azure Container Instances is a solution for any scenario that can operate in isolated containers, without orchestration. Run event-driven applications, quickly deploy from your container development pipelines, and run data processing and build jobs.
You can manage containers at scale with a fully managed Kubernetes container management and orchestration service that integrates with Azure Active
Directory.
Azure Kubernetes Service is a robust and cost-effective container orchestration service that helps you to deploy and manage containerized applications in seconds where additional resources are assigned automatically without the headache of managing additional servers.

Reference:
https://docs.microsoft.com/en-us/azure/container-instances/
https://cloudacademy.com/blog/azure-kubernetes-service-aks-what-is-it-and-why-do-we-use-it

Question: 152 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines [ ]

- to the same Azure region.
- by using the same Azure Resource Manager template.
- to the same resource group.
- to the same availability zone.

Answer:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines [ ]

- to the same Azure region.
- by using the same Azure Resource Manager template.
- to the same resource group.
- to the same availability zone.

Explanation:
A resource group is a logical container for Azure resources. Resource groups make the management of Azure resources easier.
With a resource group, you can allow a user to manage all resources in the resource group, such as virtual machines, websites, and subnets. The permissions you apply to the resource group apply to all resources

contained in the resource group.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups
https://docs.microsoft.com/en-us/azure/role-based-access-control/overview

Question: 153 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more availability zones.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
Availability zones expand the level of control you have to maintain the availability of the applications and data on your VMs. An Availability Zone is a physically separate zone, within an Azure region. There are three Availability Zones per supported Azure region.
Each Availability Zone has a distinct power source, network, and cooling. By architecting your solutions to use replicated VMs in zones, you can protect your apps and data from the loss of a datacenter. If one zone is compromised, then replicated apps and data are instantly available in another zone.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machine-scale-sets/availability

Question: 154 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
One of the benefits of Azure SQL Data Warehouse is that high availability is built into the platform.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. automatic scaling
C. data compression
D. versioning

As a fully managed Platform as a Service (PaaS) offering, Azure SQL Data Warehouse (Azure Synapse Analytics dedicated SQL pool) includes built-in high availability by default without requiring user configuration or extra infrastructure deployment.

The underlying Massively Parallel Processing (MPP) architecture separates compute from storage:
The storage layer is backed by transparent, highly available Azure Storage (LRS/geo-redundant with at least 3 automatic replicas).
The compute tier (Control and Compute nodes) is continuously monitored by the Azure service fabric and platform health agents; if a compute node fails, it is automatically recycled and replaced without manual administrator intervention.

Answer: A

Explanation:
Azure Data Warehouse (now known as Azure Synapse Analytics) is a PaaS offering from Microsoft. As with all PaaS services from Microsoft, SQL Data
Warehouse offers an availability SLA of 99.9%. Microsoft can offer 99.9% availability because it has high

availability features built into the platform.

Reference:
https://docs.microsoft.com/en-us/azure/sql-data-warehouse/sql-data-warehouse-overview-faq

Question: 155 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You plan to deploy several Azure virtual machines.
You need to ensure that the services running on the virtual machines are available if a single data center fails.
Solution: You deploy the virtual machines to two or more regions.
Does this meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

By deploying the virtual machines to two or more regions, you are deploying the virtual machines to multiple datacenters. This will ensure that the services running on the virtual machines are available if a single data center fails.

Azure operates in multiple datacenters around the world. These datacenters are grouped in to geographic regions, giving you flexibility in choosing where to build your applications.

You create Azure resources in defined geographic regions like 'West US', 'North Europe', or 'Southeast Asia'. You can review the list of regions and their locations.

Within each region, multiple datacenters exist to provide for redundancy and availability.

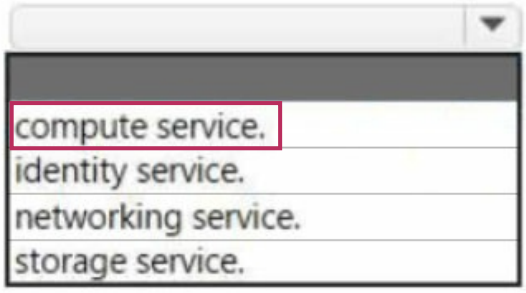
Reference:

https://docs.microsoft.com/en-us/azure/virtual-machines/windows/regions

Question: 156 CertyIQ

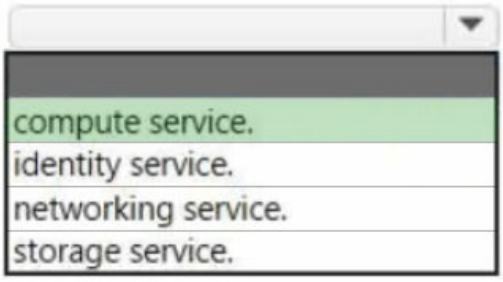
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

An Azure container instance is an example of an Azure



Answer:

An Azure container instance is an example of an Azure



Explanation:

The term compute refers to the hosting model for the computing resources that your application runs on. For Azure this include:

Azure Container Instances. The fastest and simplest way to run a container in Azure, without having to provision any virtual machines and without having to adopt a higher-level service.

Note, and also the following:

Azure App Service. A managed service for hosting web apps, mobile app back ends, RESTful APIs, or automated business processes.

Azure Spring Cloud. A managed service designed and optimized for hosting Spring Boot apps.

Azure Kubernetes Service (AKS). A managed Kubernetes service for running containerized applications.

Azure Batch. A managed service for running large-scale parallel and high-performance computing (HPC) applications

Azure Functions. A managed FaaS service.

Azure Service Fabric. A distributed systems platform that can run in many environments, including Azure or on premises.

Azure Virtual machines. Deploy and manage VMs inside an Azure virtual network.

Azure Container Apps. Deploy and manage VMs inside an Azure virtual network.

Reference:

https://docs.microsoft.com/en-us/azure/architecture/guide/technology-choices/compute-decision-tree

Question: 157

CertyIQ

At which OSI layer does ExpressRoute operate?

A. Layer 2
B. Layer 3
C. Layer 5
D. Layer 7

Azure ExpressRoute allows organizations to extend their on-premises networks into the Microsoft cloud over a private connection facilitated by a connectivity provider.

ExpressRoute relies on Layer 3 (Network layer) IP routing using industry-standard dynamic routing protocols (eBGP — External Border Gateway Protocol) to exchange routes between customer on-premises routers, provider edge devices, and Microsoft Enterprise Edge (MSEE) routers.

In Microsoft's official networking documentation and fundamental exam taxonomies, ExpressRoute is classified as providing dedicated, private Layer 3 connectivity.

Answer: B

Explanation:

Layer 3

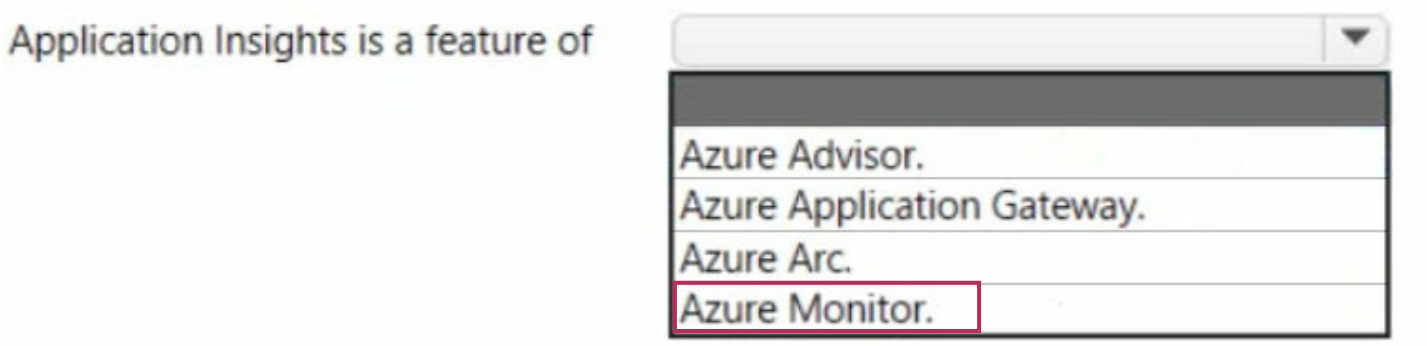
https://learn.microsoft.com/en-us/azure/expressroute/expressroute-introduction#key-benefits

Layer 3 connectivity between your on-premises network and the Microsoft Cloud through a connectivity provider. Connectivity can be from an any-to-any (IPVPN) network, a point-to-point Ethernet connection, or through a virtual cross-connection via an Ethernet exchange.

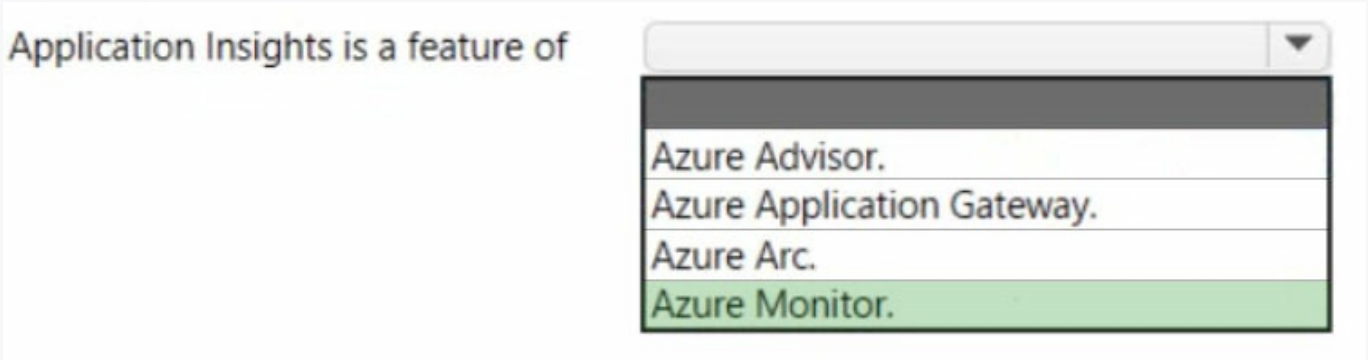
Question: 158

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:
Application Insights is a feature of Azure Monitor that provides extensible application performance management (APM) and monitoring for live web apps.

Reference:
https://docs.microsoft.com/en-us/azure/azure-monitor/app/app-insights-overview

Question: 159 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

A Resource Group is strictly a logical management and lifecycle container, not a network boundary, security isolation perimeter, or communication barrier. Resources in one resource group can freely communicate with and access resources located in other resource groups or subscriptions, provided network connectivity (e.g., VNet routing, peering, public endpoints) and appropriate access permissions allow it.

Statements	Yes	No
Azure resources can only access other resources in the same resource group.	○	○
If you delete a resource group, all the resources in the resource group will be deleted.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Resource groups define the lifecycle boundary for the assets they hold. Deleting a resource group issues a cascade deletion call through Azure Resource Manager (ARM), which permanently deletes every resource contained inside that resource group.

Answer:

Answer Area

Statements	Yes	No
Azure resources can only access other resources in the same resource group.	○	○
If you delete a resource group, all the resources in the resource group will be deleted.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Explanation:
Box 1: No -
A resource can interact with resources in other resource groups.

Box 2: Yes -
Deleting the resource group will remove the resource group as well as all the resources in that resource group. This can be useful for the management of resources. For example, a virtual machine has several components (the VM itself, virtual disks, network adapter etc.). By placing the VM in its own resource group, you can delete the VM along with all its associated components by deleting the resource group.
Another example is when creating a test environment. You could place the entire test environment (Network components, virtual machines etc.) in one resource group. You can then delete the entire test environment by deleting the resource group.

Box 3: Yes -
Resources from multiple different regions can be placed in a resource group. The resource group only contains metadata about the resources it contains.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview
https://www.codeisahighway.com/effective-ways-to-delete-resources-in-a-resource-group-on-azure/

Question: 160 CertyIQ

You plan to store 20 TB of data in Azure. The data will be accessed infrequently and visualized by using Microsoft Power BI.
You need to recommend a storage solution for the data.

Which two solutions should you recommend? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Azure Data Lake
B. Azure Cosmos DB
C. Azure SQL Data Warehouse
D. Azure SQL Database
E. Azure Database for PostgreSQL

Azure Data Lake (ADLS Gen2): Designed specifically for big data analytics, petabyte-scale storage, and cost-effective cold/infrequent access patterns. It provides native connectors directly into Microsoft Power BI (via the Azure Data Lake Storage connector or DirectQuery/Import), allowing large-scale reporting and reporting datasets without requiring full transactional database overhead.

Azure SQL Data Warehouse (Azure Synapse Analytics): Built on a Massively Parallel Processing (MPP) engine designed for large analytical workloads typically ranging from several terabytes to petabytes. It integrates seamlessly with Power BI and allows compute pausing/scaling when access is infrequent, significantly minimizing costs while retaining the 20 TB data volume.

Answer: AC

Explanation:

Azure SQL Data Warehouse is now Azure Synapse Analytics

You can use Power BI to analyze and visualize data stored in Azure Data Lake and Azure SQL Data Warehouse.

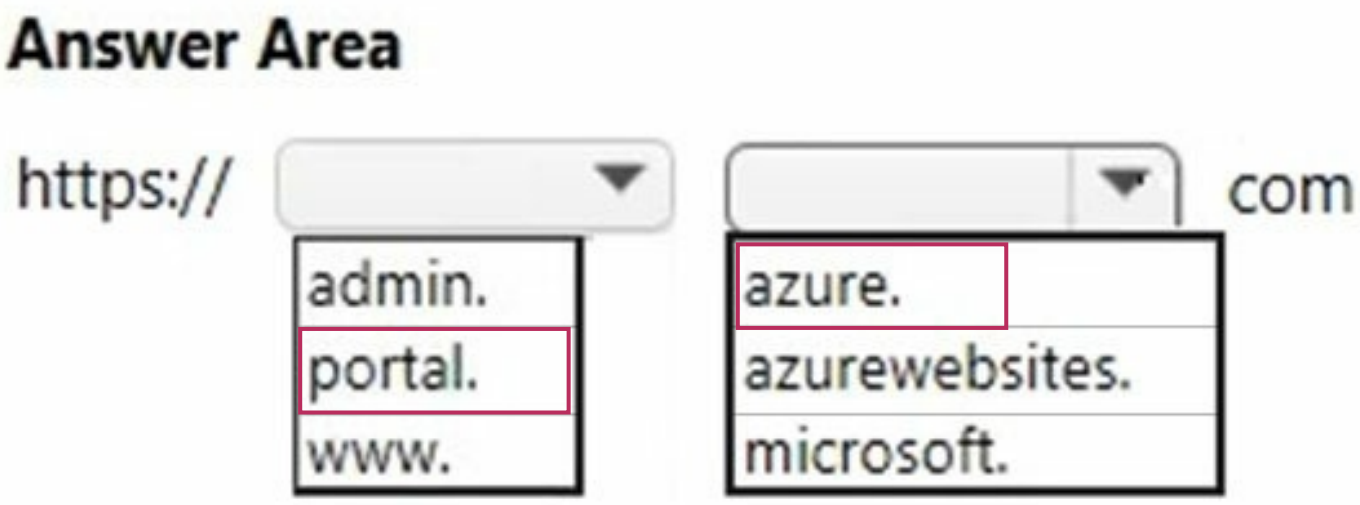
Azure Data Lake includes all of the capabilities required to make it easy for developers, data scientists and analysts to store data of any size and shape and at any speed, and do all types of processing and analytics across platforms and languages. It removes the complexities of ingesting and storing all your data while making it faster to get up and running with batch, streaming and interactive analytics. It also integrates seamlessly with operational stores and data warehouses so that you can extend current data applications.

References:

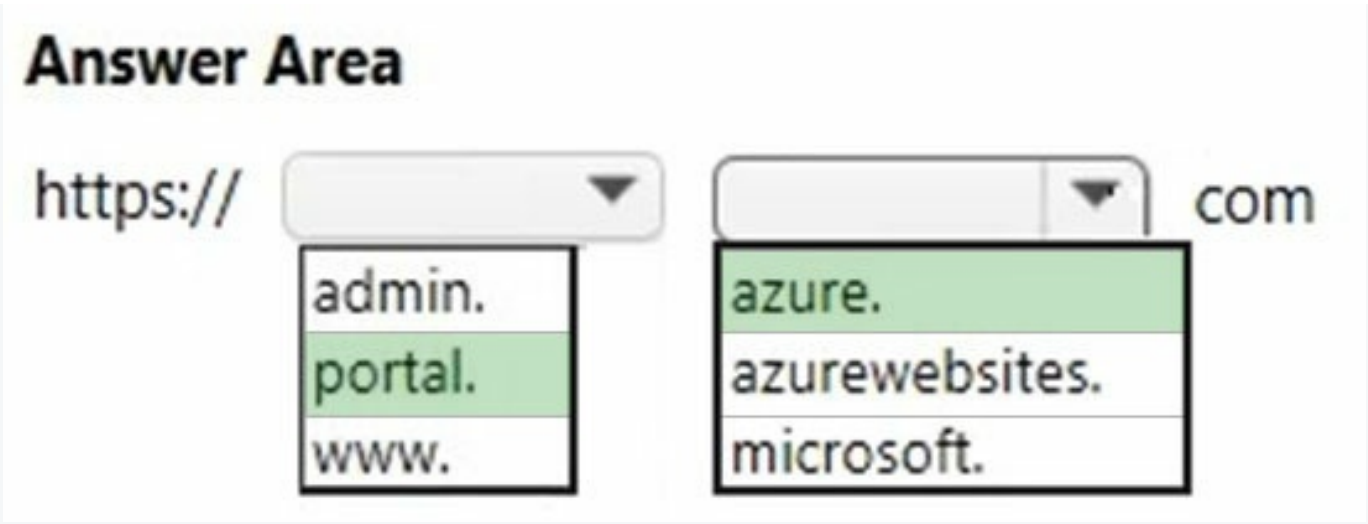
https://docs.microsoft.com/en-us/azure/data-lake-store/data-lake-store-power-bi
https://azure.microsoft.com/en-gb/solutions/data-lake/ https://docs.microsoft.com/en-us/azure/data-lake-store/data-lake-store-power-bi

Question: 161 CertyIQ

HOTSPOT -
You have an Azure environment that contains 10 web apps. To which URL should you connect to manage all the Azure resources? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:



Answer:



Explanation:

The Azure portal is a web-based management interface where you can view and manage all your Azure resources in one unified hub, including web apps, databases, virtual machines, virtual networks, storage and Visual Studio team projects.

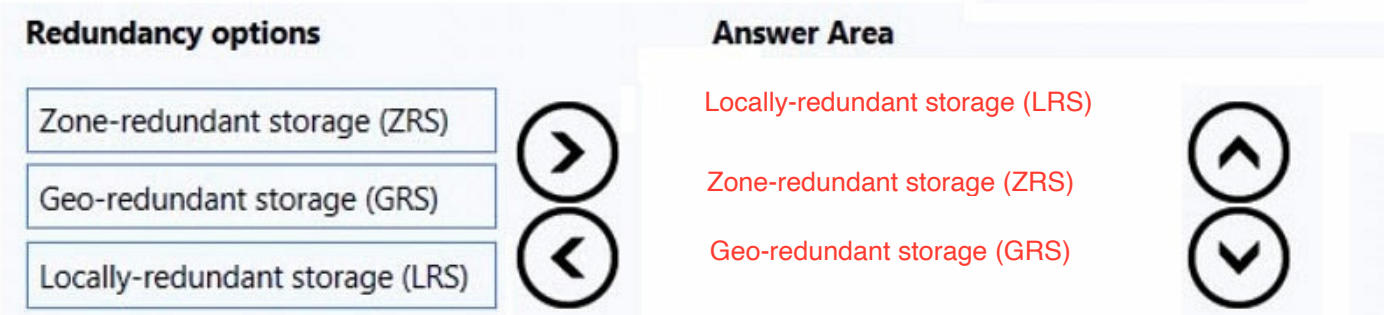
The URL of the Azure portal is https://portal.azure.com.

References:

https://azure.microsoft.com/en-gb/features/azure-portal/

Question: 162 CertyIQ

DRAG DROP -
Arrange the storage account redundancy options from the least redundant to the most redundant. To answer, move all options from the list of options to the answer area and arrange them in the correct order.
Select and Place:

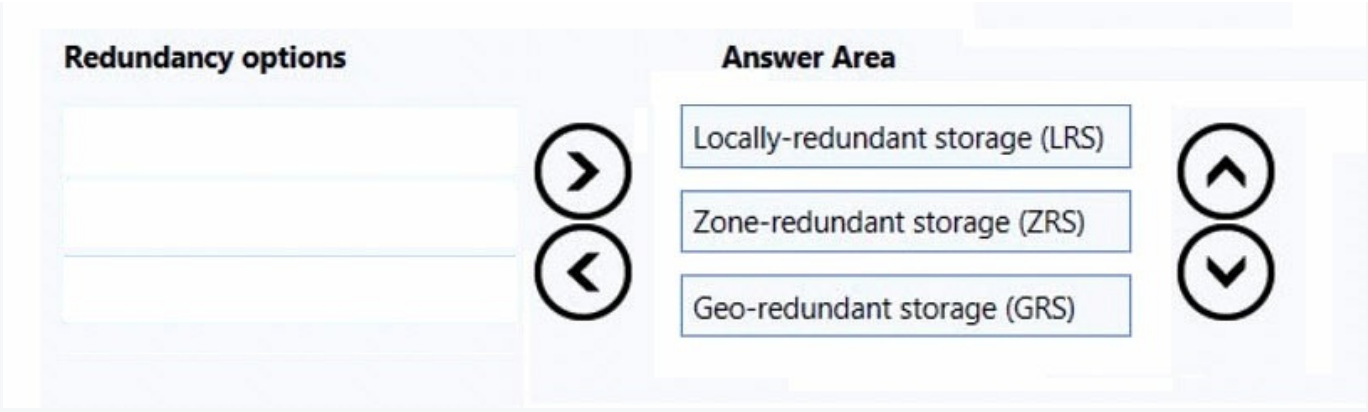


Answer:

Locally-redundant storage (LRS): Replicates data three times synchronously within a single physical datacenter in the primary region. It protects against standard hardware and disk drive failures, but a physical facility-wide catastrophe (fire, flooding, power outage) can result in data unavailability or loss. This is the baseline, least redundant option ($11 \text{ nines / } 99.999999999\%$ durability).

Zone-redundant storage (ZRS): Replicates data synchronously across three distinct Azure availability zones within the primary region. Each zone consists of one or more separate physical datacenters equipped with independent power, cooling, and networking. It withstands entire datacenter outages within the region ($12 \text{ nines / } 99.9999999999\%$ durability).

Geo-redundant storage (GRS): Protects against regional-scale disasters by combining primary region replication with cross-region replication. It synchronously copies data three times using LRS in the primary region, and then asynchronously replicates data to a secondary, paired region hundreds of miles away (where it is stored three times via LRS again, for a total of 6 copies). It provides cross-regional disaster recovery ($16 \text{ nines / } 99.99999999999999\%$ durability).



Explanation:

Locally-redundant storage (LRS)

Zone-redundant storage (ZRS)

Geo-redundant storage (GRS)

Question: 163 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure Blob Storage is a

- data store for queuing and reliably delivering messages between applications.
- file share that can be mapped as a network drive.
- key/attribute store for non-relational, structured data.
- storage service optimized for very large objects, such as video files and bitmaps.

Answer:

Answer Area

Azure Blob Storage is a

- data store for queuing and reliably delivering messages between applications.
- file share that can be mapped as a network drive.
- key/attribute store for non-relational, structured data.
- storage service optimized for very large objects, such as video files and bitmaps.

Explanation:

Azure Blob storage is mainly used for unstructured large files such as audio, video, images, backup files, etc

Question: 164 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs Linux and has the Azure CLI tools installed.
Does this meet the goal?

A. Yes
B. No

PowerShell scripts (.ps1) require the PowerShell runtime (PowerShell 7 / Core for cross-platform support) and the Azure PowerShell module (Az), not the Azure CLI (az).

While both PowerShell and Azure CLI can run on Linux, macOS, and Windows, Azure CLI commands are structured as bash-friendly commands (az group create ...), whereas Azure PowerShell uses cmdlet syntax (New-AzResourceGroup).

Answer: B

Explanation:

Having only Azure CLI installed on a Linux host does not satisfy the requirement to execute a script written in PowerShell.

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.
PowerShell can now be installed on Linux. However, the question states that the computer has Azure CLI tools, not PowerShell installed. Therefore, this solution does not meet the goal.

Reference:
https://docs.microsoft.com/en-us/powershell/scripting/components/ise/how-to-write-and-run-scripts-in-the-windows-powershell-ise?view=powershell-6

Question: 165 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs Chrome OS and uses Azure Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources.

Because Cloud Shell runs entirely in a web browser (e.g., Google Chrome), it is platform-agnostic and fully functional on Chrome OS, Windows, macOS, or Linux without requiring local tooling installation.

Answer: A

Explanation:

Azure Cloud Shell provides a choice between Bash and PowerShell. The PowerShell experience comes pre-installed with the latest Azure PowerShell (Az) module, git, and command-line utilities, allowing users to upload and execute PowerShell scripts directly against their Azure subscription.

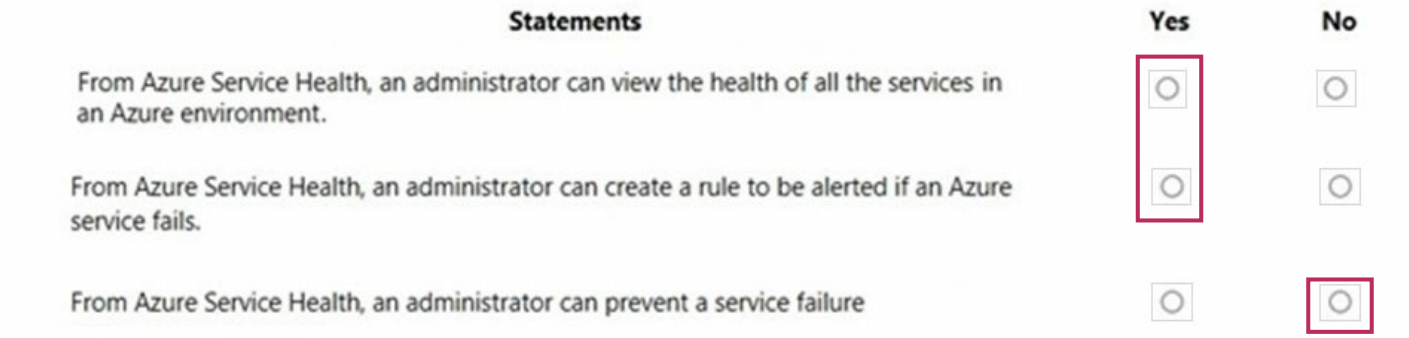
A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.
With the Azure Cloud Shell, you can run PowerShell cmdlets and scripts in a Web browser. You log in to the Azure Portal and select the Azure Cloud Shell option.
This will open a PowerShell session in the Web browser. The Azure Cloud Shell has the necessary Azure PowerShell module installed.
Note: to run a PowerShell script in the Azure Cloud Shell, you need to change to the directory where the PowerShell script is stored.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-shell/quickstart-powershell

Question: 166 CertyIQ

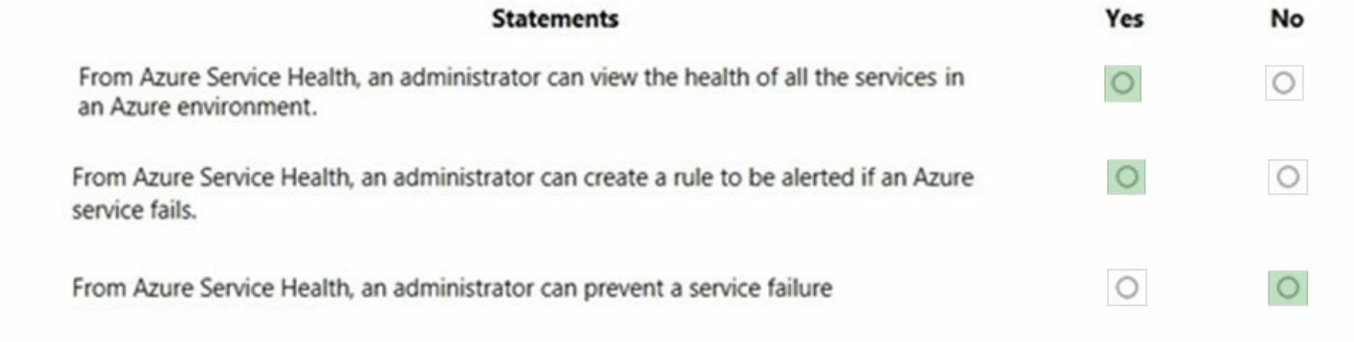
HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:
Box 1: Yes -
Azure Service Health consists of three components: Azure Status, Azure Service Heath and Azure Resource Health.
Azure service health provides a personalized view of the health of the Azure services and regions you're using. This is the best place to look for service impacting communications about outages, planned maintenance activities, and other health advisories because the authenticated Azure Service Health experience knows which services and resources you currently use.
To view the health of all other services available in Azure, you would use the Azure Status component of Azure Service Health. Azure status informs you of service outages in Azure on the Azure Status page. The page is a global view of the health of all Azure services across all Azure regions.

Box 2: Yes -
The best way to use Service Health is to set up Service Health alerts to notify you via your preferred communication channels when service issues, planned maintenance, or other changes may affect the Azure services and regions you use.

Box 3: No -

You can use Resource Health to view the health of a virtual machine. However, you cannot use Resource Health to prevent a service failure affecting the virtual machine.
Azure resource health provides information about the health of your individual cloud resources such as a specific virtual machine instance.

Reference:
https://docs.microsoft.com/en-us/azure/service-health/overview

Question: 167 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs macOS and has PowerShell Core 6.0 installed.
Does this meet the goal?

A. Yes
B. No

What Is Actually Required
PowerShell Engine (The Shell / Runtime):
Either Windows PowerShell 5.1 (built into Windows) or PowerShell Core (PowerShell 7+) on Windows, macOS, or Linux.

The Azure PowerShell Module (Az):
PowerShell out of the box only understands base operating system cmdlets (like Get-Process, Set-Item).

Answer: B

Explanation: It does not know what an Azure resource group or VM is until you install the Az module, which provides the Azure-specific cmdlets (Connect-AzAccount, New-AzResourceGroup, New-AzVM):
The computer has PowerShell Core 6.0, but it doesn't have the Azure CLI installed. There is no mention of that in the question. You need Azure PowerShell module in addition to PowerShell to run Azure commands, such as New-AzVM.

Therefore, the answer = B, No.

PowerShell Core 6.0 will not bring Azure Powershell module in default. Therefore you have to install azure PowerShell module after installing PowerShell Core 6.0 into Mac. This means you need PowerShell Core 6.0 on your Mac to run the cmdlets of Azure PowerShell module.

Mac has Bash and does not come with PowerShell which is for Windows Machines.

To install PowerShell for Mac

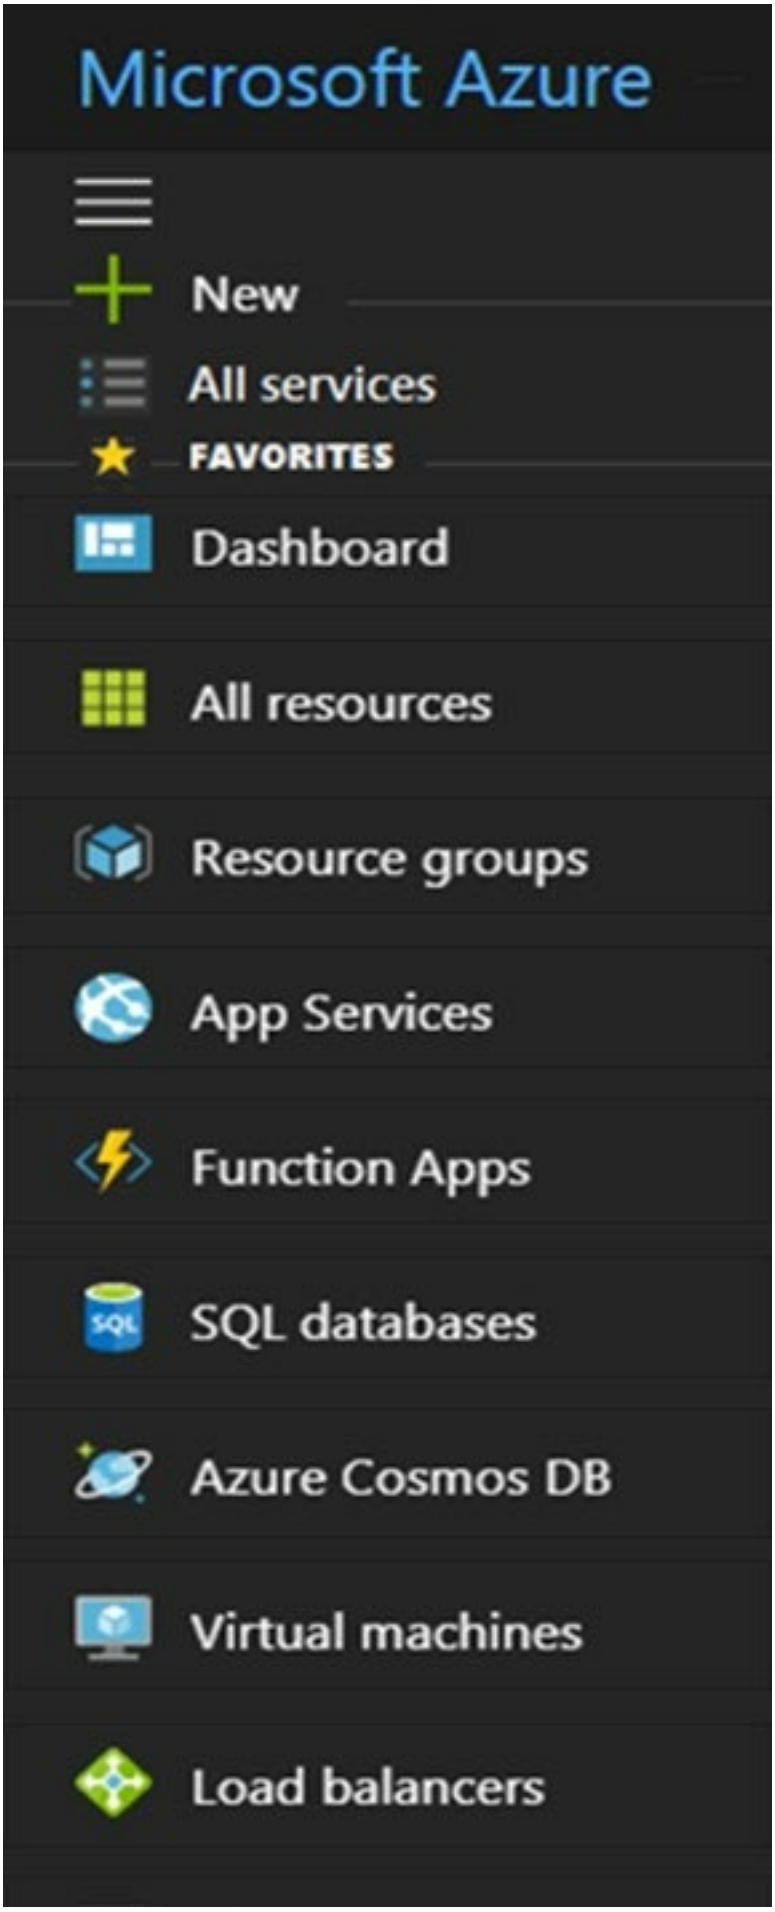
https://www.google.com/search?client=safari&rls=en&q=Install+Powershell+for+Mac&ie=UTF-8&oe=UTF-8

To install the Azure Az PowerShell module

https://learn.microsoft.com/en-us/powershell/azure/install-az-ps?view=azps-9.1.0

Question: 168 CertyIQ

HOTSPOT -
You need to view a list of planned maintenance events that can affect the availability of an Azure subscription.
Which blade should you use from the Azure portal? To answer, select the appropriate blade in the answer area.
Hot Area:

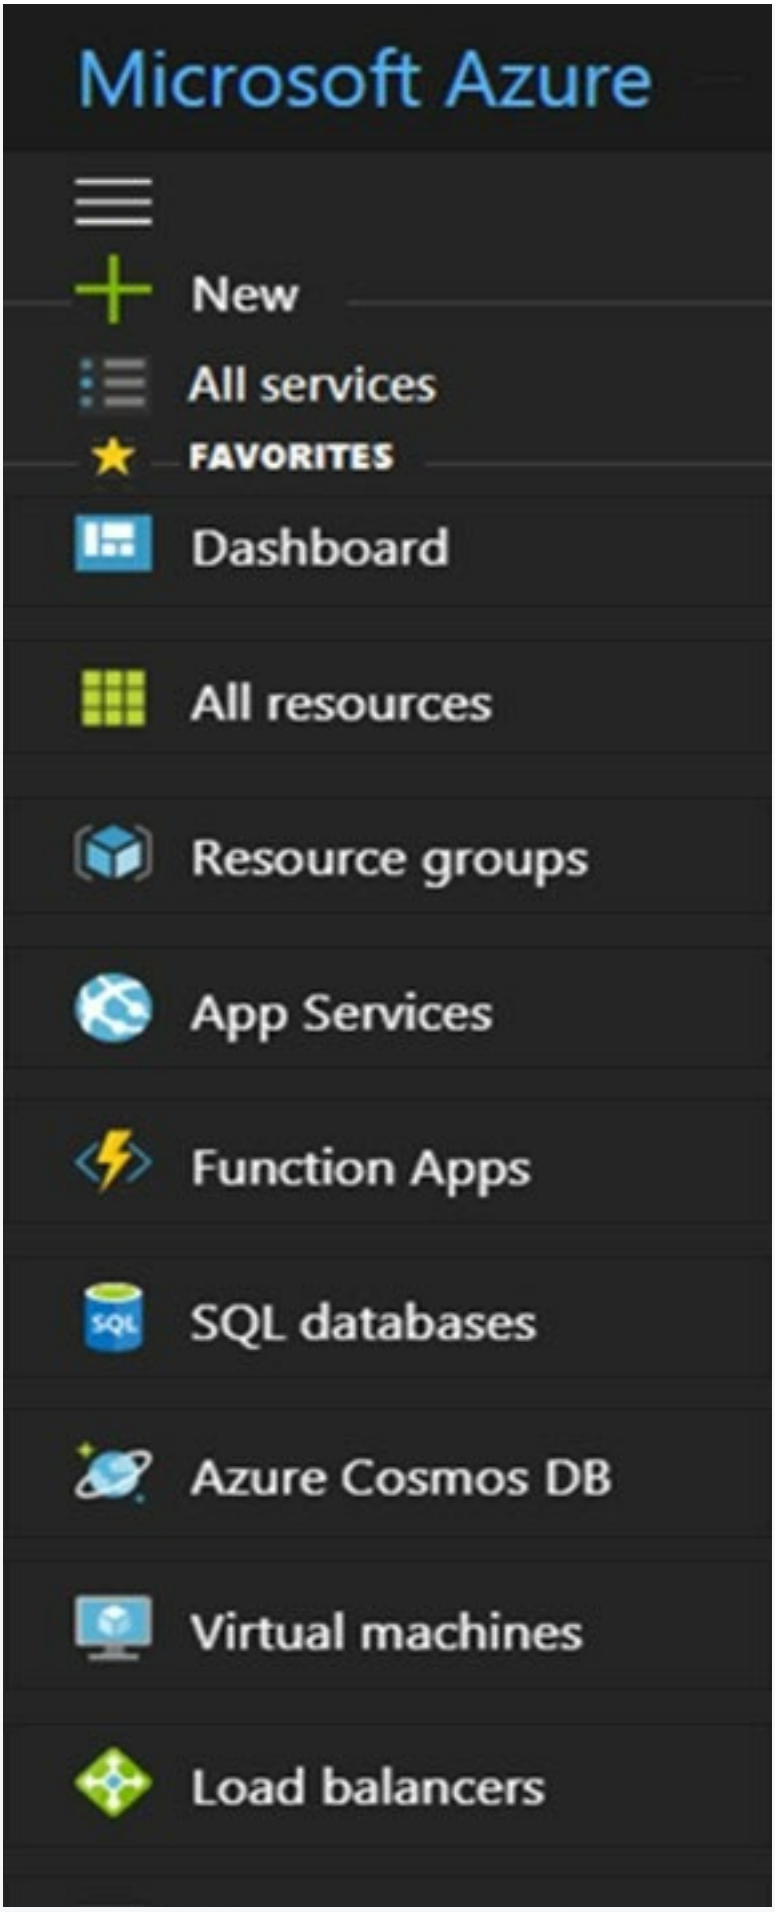


Help + support
(or Help + support / Service Health)

Azure Service Health provides a personalized view of the status and health of the Azure services, regions, and resources mapped to your specific subscriptions.

Within the Azure Service Health console, the Planned maintenance section lists upcoming maintenance events scheduled by Microsoft (e.g., host OS updates, hardware reboots, infrastructure patching) that may affect resource availability.

Answer:



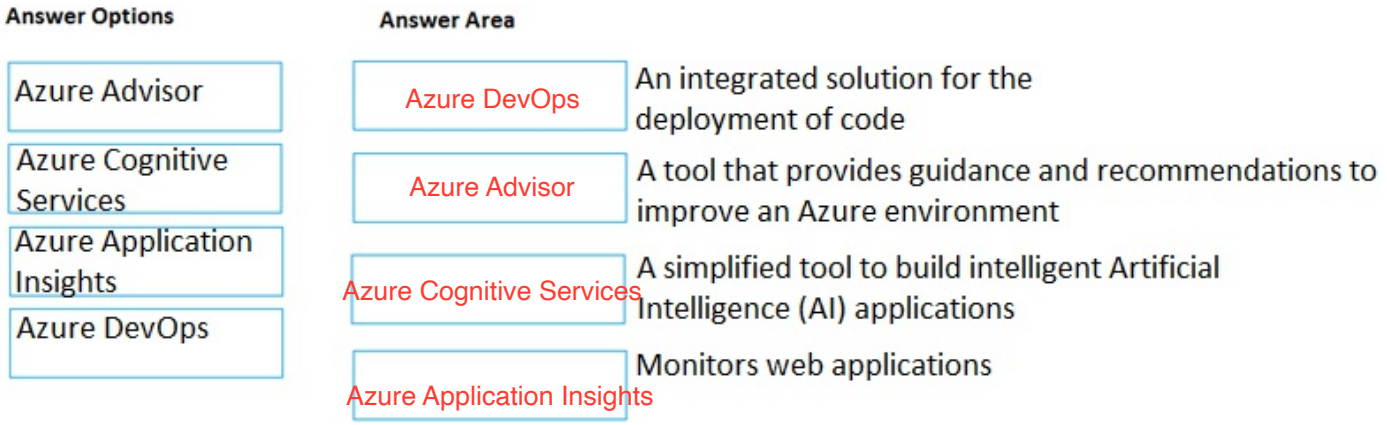
Explanation:

On the Help and Support blade, there is a Service Health option. If you click Service Health, a new blade opens. The Service Health blade contains the Planned

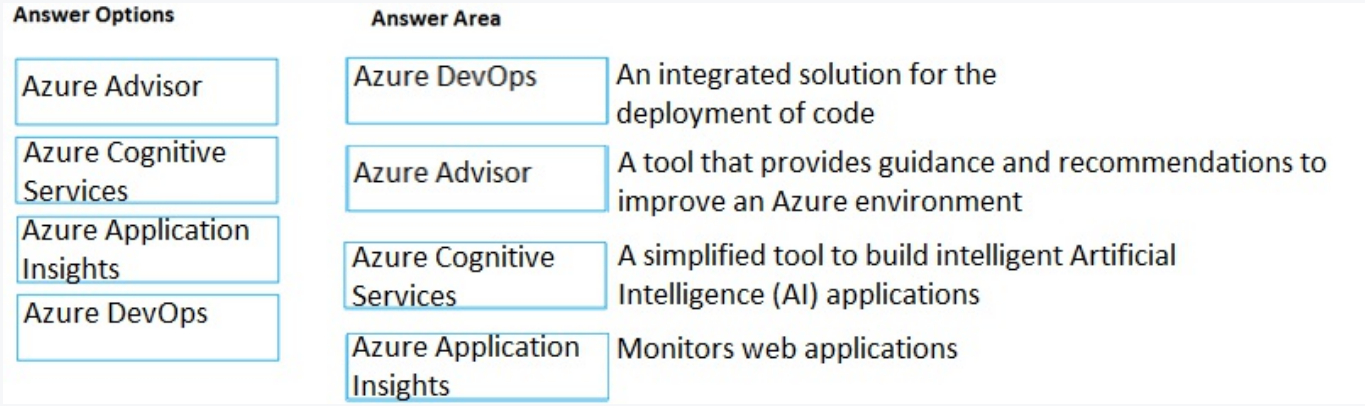
Maintenance link which opens a blade where you can view a list of planned maintenance events that can affect the availability of an Azure subscription.

Question: 169 CertyIQ

DRAG DROP -
Match the Azure service to the correct definition.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:
Box 1: Azure DevOps.
Azure DevOps is Microsoft's primary software development and deployment platform.
DevOps influences the application lifecycle throughout its plan, develop, deliver and operate phases.
Box 2: Azure Advisor.
Advisor is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. It analyzes your resource configuration and usage telemetry and then recommends solutions that can help you improve the cost effectiveness, performance, high availability, and security of your Azure resources.
Box 3: Azure Cognitive Services.
Azure Cognitive Services are APIs, SDKs, and services available to help developers build intelligent applications without having direct AI or data science skills or knowledge. Azure Cognitive Services enable developers to easily add cognitive features into their applications. The goal of Azure Cognitive Services is to help developers create applications that can see, hear, speak, understand, and even begin to reason. The catalog of services within Azure Cognitive Services can be categorized into five main pillars - Vision, Speech, Language, Web Search, and Decision.
Box 4. Azure Application Insights.
Azure Application Insights detects and diagnoses anomalies in web apps.

Application Insights, a feature of Azure Monitor, is an extensible Application Performance Management (APM) service for developers and DevOps professionals.
Use it to monitor your live applications. It will automatically detect performance anomalies, and includes powerful analytics tools to help you diagnose issues and to understand what users actually do with your app.

Reference:
https://docs.microsoft.com/en-us/azure/azure-monitor/app/app-insights-overview
https://azure.microsoft.com/en-gb/overview/what-is-devops/ https://docs.microsoft.com/en-us/azure/advisor/advisor-overview https://docs.microsoft.com/en-us/azure/cognitive-services/welcome

Question: 170 CertyIQ

DRAG DROP -
Match the Azure service to the correct description.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer Options	Answer Area	
Azure HDInsight	Azure SQL Database	A managed relational cloud database service.
Azure Data Lake Analytics	Synapse Analytics	A cloud-based service that leverages massively parallel processing (MPP) to quickly run complex queries across petabytes of data in a relational database.
Azure SQL Synapse Analytics	Azure Data Lake Analytics	Can run massively parallel data transformation and processing programs across petabytes of data
Azure SQL Database	Azure HDInsight	An open-source framework for the distributed processing and analysis of big data sets in clusters

Answer:

Answer Options	Answer Area	
	Azure SQL Database	A managed relational cloud database service.
	Azure SQL Synapse Analytics	A cloud-based service that leverages massively parallel processing (MPP) to quickly run complex queries across petabytes of data in a relational database.
	Azure Data Lake Analytics	Can run massively parallel data transformation and processing programs across petabytes of data
	Azure HDInsight	An open-source framework for the distributed processing and analysis of big data sets in clusters

Explanation:

Clue:

Relational: Sql

Massive: Synapse

Massive PetaByte: Lake

Opensource: Insight

Box 1: Azure SQL Database -

SQL Server is a relational database service. Azure SQL Database is a managed SQL Server Database in Azure. The SQL Server is managed by Microsoft; you just have access to the database.

Box 2: Azure SQL Synapse Analytics

Azure SQL Synapse Analytics (previously called Data Warehouse) is a cloud-based Platform-as-a-Service (PaaS) offering from Microsoft. It is a large-scale, distributed, MPP (massively parallel processing) relational database technology in the same class of competitors as Amazon Redshift or Snowflake. Azure SQL

Synapse Analytics is an important component of the Modern Data Warehouse multi-platform architecture. Because Azure SQL Synapse Analytics is an MPP system with a shared-nothing architecture across distributions, it is meant for large-scale analytical workloads which can take advantage of parallelism.

Box 3: Azure Data Lake Analytics

You can process big data jobs in seconds with Azure Data Lake Analytics. You can process petabytes of data for diverse workload categories such as querying,

ETL, analytics, machine learning, machine translation, image processing and sentiment analysis by leveraging existing libraries written in .NET languages, R or

Python.

Box 4: Azure HDInsight.

Apache Hadoop was the original open-source framework for distributed processing and analysis of big data sets on clusters. The Hadoop ecosystem includes related software and utilities, including Apache Hive, Apache HBase, Spark, Kafka, and many others.

Azure HDInsight is a fully managed, full-spectrum, open-source analytics service in the cloud for enterprises. The Apache Hadoop cluster type in Azure HDInsight allows you to use HDFS, YARN resource management, and a simple MapReduce programming model to process and analyze batch data in parallel.

https://azure.microsoft.com/en-us/services/sql-database/

https://docs.microsoft.com/en-us/azure/sql-data-warehouse/sql-data-warehouse-overview-what-is
https://docs.microsoft.com/bs-latn-ba/azure/hdinsight/hadoop/apache-hadoop-introduction
https://www.blue-granite.com/blog/is-azure-sql-data-warehouse-a-good-fit-updated
https://azure.microsoft.com/en-gb/services/data-lake-analytics/

Question: 171 CertyIQ

HOTSPOT -
You need to identify which blades in the Azure portal must be used to perform the following tasks:
- View security recommendations.
- Monitor the health of Azure services.
- Browse available virtual machine images.

Which blade should you identify for each task? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Monitor the health of Azure services:

- Monitor
- Subscriptions
- Marketplace
- Advisor

Browse available virtual machine images:

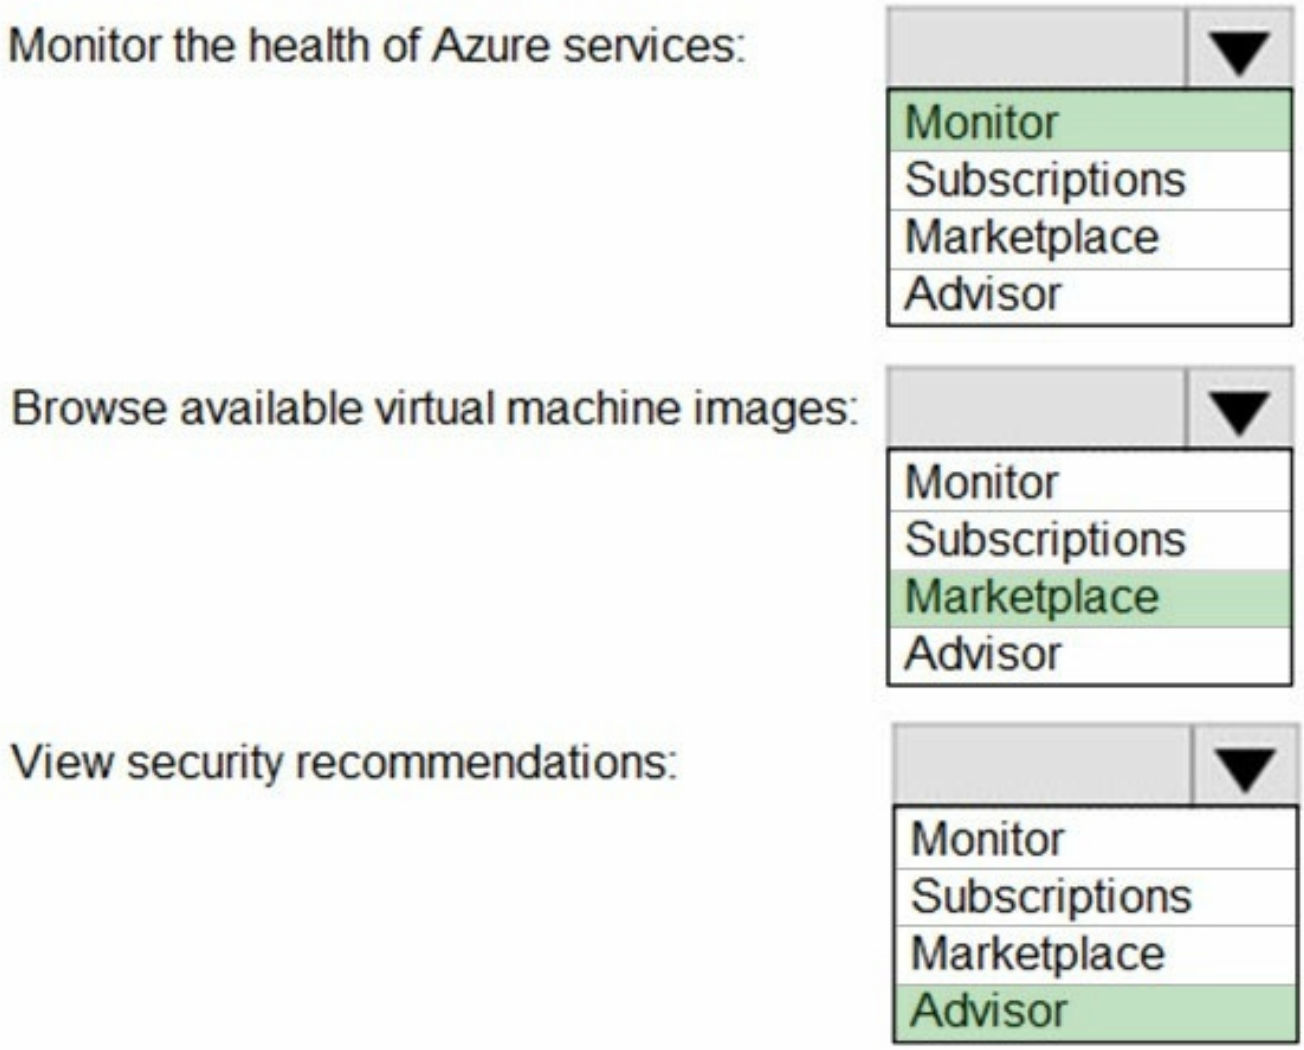
- Monitor
- Subscriptions
- Marketplace
- Advisor

View security recommendations:

- Monitor
- Subscriptions
- Marketplace
- Advisor

Answer:

Answer Area



Explanation:

Box 1:

Azure Monitor is used to monitor the health of Azure services.

Azure Monitor maximizes the availability and performance of your applications and services by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments. It helps you understand how your applications are performing and proactively identifies issues affecting them and the resources they depend on.

Box 2:

You can browse available virtual machine images in the Azure Marketplace.

Azure Marketplace provides access and information on solutions and services available from Microsoft and their partners. Customers can discover, try, or buy cloud software solutions built on or for Azure. The catalog of 8,000+ listings provides Azure building blocks, such as Virtual Machines (VMs), APIs, Azure apps, Solution Templates and managed applications, SaaS apps, containers, and consulting services.

Box 3.

Azure Advisor displays security recommendations.

Azure Advisor provides you with a consistent, consolidated view of recommendations for all your Azure resources. It integrates with Azure Security Center to bring you security recommendations. You can get security recommendations from the Security tab on the Advisor dashboard.

Security Center helps you prevent, detect, and respond to threats with increased visibility into and control over the security of your Azure resources. It periodically analyzes the security state of your Azure resources. When Security Center identifies potential security vulnerabilities, it creates recommendations. The

recommendations guide you through the process of configuring the controls you need.

Reference:
https://docs.microsoft.com/en-us/azure/azure-monitor/overview https://docs.microsoft.com/en-us/azure/marketplace/marketplace-faq-publisher-guide https://docs.microsoft.com/en-us/azure/advisor/advisor-security-recommendations

Question: 172 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use Bash in Azure Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
With Azure Cloud Shell, you can create virtual machines using Bash or PowerShell.
Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-shell/quickstart https://docs.microsoft.com/en-us/azure/cloud-shell/overview

Question: 173 CertyIQ

You have an on-premises application that sends email notifications automatically based on a rule.
You plan to migrate the application to Azure.
You need to recommend a serverless computing solution for the application.
What should you include in the recommendation?

A. a web app
B. a server image in Azure Marketplace
C. a logic app
D. an API app

Answer:

C

Explanation:

Azure Logic Apps is a cloud service that helps you schedule, automate, and orchestrate tasks, business processes, and workflows when you need to integrate apps, data, systems, and services across enterprises or organizations. Logic Apps simplifies how you design and build scalable solutions for app integration, data integration, system integration, enterprise application integration (EAI), and business-to-business (B2B) communication, whether in the cloud, on premises, or both.

For example, here are just a few workloads you can automate with logic apps:

- Process and route orders across on-premises systems and cloud services.
- Send email notifications with Office 365 when events happen in various systems, apps, and services.
- Move uploaded files from an SFTP or FTP server to Azure Storage.
- Monitor tweets for a specific subject, analyze the sentiment, and create alerts or tasks for items that need review.

References:

https://docs.microsoft.com/en-us/azure/logic-apps/logic-apps-overview

Question: 174 CertyIQ

You plan to deploy a website to Azure. The website will be accessed by users worldwide and will host large video files.
You need to recommend which Azure feature must be used to provide the best video playback experience.
What should you recommend?

A. an application gateway
B. an Azure ExpressRoute circuit
C. a content delivery network (CDN)
D. an Azure Traffic Manager profile

Answer: C

Explanation:
The question states that users are located worldwide and will be downloading large video files. The video playback experience would be improved if they can download the video from servers in the same region as the users. We can achieve this by using a content deliver network.
A content delivery network (CDN) is a distributed network of servers that can efficiently deliver web content to users. CDNs store cached content on edge servers in point-of-presence (POP) locations that are close to end users, to minimize latency.
Azure Content Delivery Network (CDN) offers developers a global solution for rapidly delivering high-bandwidth content to users by caching their content at strategically placed physical nodes across the world. Azure CDN can also accelerate dynamic content, which cannot be cached, by leveraging various network optimizations using CDN POPs. For example, route optimization to bypass Border Gateway Protocol (BGP).
The benefits of using Azure CDN to deliver web site assets include:
- Better performance and improved user experience for end users, especially when using applications in which multiple round-trips are required to load content.
- Large scaling to better handle instantaneous high loads, such as the start of a product launch event.
- Distribution of user requests and serving of content directly from edge servers so that less traffic is sent to the origin server.

Reference:
https://docs.microsoft.com/en-us/azure/cdn/cdn-overview

Question: 175 CertyIQ

Your company plans to deploy several million sensors that will upload data to Azure.
You need to identify which Azure resources must be created to support the planned solution.
Which two Azure resources should you identify? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Azure Data Lake
B. Azure Queue storage
C. Azure File Storage
D. Azure IoT Hub
E. Azure Notification Hubs

Answer: AD

Explanation:
IoT Hub (Internet of things Hub) provides data from millions of sensors.
IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.
There are two storage services IoT Hub can route messages to -- Azure Blob Storage and Azure Data Lake Storage Gen2 (ADLS Gen2) accounts. Azure Data
Lake Storage accounts are hierarchical namespace-enabled storage accounts built on top of blob storage. Both of these use blobs for their storage.

Reference:
https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub
https://docs.microsoft.com/en-us/azure/iot-hub/iot-hub-devguide-messages-d2c

Question: 176 CertyIQ

You have an Azure web app.
You need to manage the settings of the web app from an iPhone.
What are two Azure management tools that you can use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Azure CLI
B. the Azure portal
C. Azure Cloud Shell
D. Windows PowerShell
E. Azure Storage Explorer

Answer: BC

Explanation:
The Azure portal is the web-based portal for managing Azure. Being web-based, you can use the Azure portal

on an iPhone.
Azure Cloud Shell is a web-based command line for managing Azure. You access the Azure Cloud Shell from the Azure portal. Being web-based, you can use the
Azure Cloud Shell on an iPhone.
Incorrect Answers:
A: Azure CLI can be installed on MacOS but it cannot be installed on an iPhone.
D: Windows PowerShell can be installed on MacOS but it cannot be installed on an iPhone.
E: Azure Storage Explorer is not used to manage Azure web apps.

Reference:
http://www.deployazure.com/management/managing-azure-from-ipad/

Question: 177 CertyIQ

Your company plans to deploy an Artificial Intelligence (AI) solution in Azure.
What should the company use to build, test, and deploy predictive analytics solutions?

A. Azure Logic Apps
B. Azure Machine Learning Designer
C. Azure Batch
D. Azure Cosmos DB

Answer: B

Explanation:

Azure Machine Learning designer lets you visually connect datasets and modules on an interactive canvas to create machine learning models.

Reference:

https://docs.microsoft.com/en-us/azure/machine-learning/concept-designer

Question: 178 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): Azure Advisor acts as a proactive architectural guidance engine across Reliability (High Availability), Security, Performance, Operational Excellence, and Cost. It generates a list of virtual machines that are not backed up (recommending you enable Azure Backup to protect them). To see the inventory of VMs that are already protected, you navigate to Azure Backup Center or the specific Recovery Services Vault / Backup Vault, not Azure Advisor.

Statement 2 (No): Secure Score (calculated by Microsoft Defender for Cloud and surfaced via Azure Advisor) measures your organization's security posture. When you implement security recommendations (such as enabling MFA, encrypting disks, or installing endpoint protection), vulnerabilities are closed and your Secure Score increases, not decreases.

Statement 3 (No): Azure Advisor recommendations are entirely advisory and optional best-practice guidance. Microsoft Support agreements (Developer, Standard, Professional Direct, or Premier/Unified) are governed by paid support plan contracts and service terms; they are never revoked or penalized if you choose not to implement Advisor recommendations.

Answer Area

Statements	Yes	No
Azure Advisor can generate a list of Azure virtual machines that are protected by Azure Backup.	○	○
If you implement the security recommendations provided by Azure Advisor, your company's secure score will decrease.	○	○
To maintain Microsoft support, you must implement the security recommendations provided by Azure Advisor within a period of 30 days.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Advisor can generate a list of Azure virtual machines that are protected by Azure Backup.	○	○
If you implement the security recommendations provided by Azure Advisor, your company's secure score will decrease.	○	○
To maintain Microsoft support, you must implement the security recommendations provided by Azure Advisor within a period of 30 days.	○	○

Explanation:

Box 1: No -

Azure Advisor does not generate a list of virtual machines that ARE protected by Azure Backup. Azure Advisor does however, generate a list of virtual that ARE
NOT protected by Azure Backup. You can view a list of virtual machines that are protected by Azure Backup by viewing the Protected Items in the Azure Recovery
Services Vault.

Box 2: No -

If you implement the security recommendations, you company's score will increase, not decrease.

Box 3: No -
There is no requirement to implement the security recommendations provided by Azure Advisor. The recommendations are just that, 'recommendations'. They are not 'requirements'.

Reference:
https://azure.microsoft.com/en-gb/blog/advisor-backup-recommendations/ https://docs.microsoft.com/en-us/azure/advisor/advisor-overview https://microsoft.github.io/AzureTipsAndTricks/blog/tip173.html

Question: 179 CertyIQ

What can you use to automatically send an alert if an administrator stops an Azure virtual machine?

A. Azure Advisor
B. Azure Service Health
C. Azure Monitor
D. Azure Network Watcher

Azure Monitor centralizes monitoring and alerting across all Azure resources.

When an administrator performs an operational or management action—such as stopping or deallocating a virtual machine (Microsoft.Compute/virtualMachines/powerOff/action or deallocate/action)—that management event is recorded in the Azure Activity Log.

Answer: C

Explanation:

Azure Monitor Alert Rules (specifically Activity Log Alerts) can be configured to listen for these administrative operations and automatically trigger notifications via an Action Group (sending emails, SMS, push alerts, or webhooks) the moment the action occurs.

Azure Monitor is correct answer.

Azure Service Health provides the health/status of Azure service.

Azure Monitor - Provides Health/Status of your application using insights and logs

Reference:

https://docs.microsoft.com/en-us/azure/azure-monitor/insights/vminsights-alerts

Question: 180 CertyIQ

DRAG DROP -
Match the Azure services to the correct descriptions.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point
Select and Place:

Azure Services

- Azure Machine Learning
- Azure Synapse Analytics
- Azure IoT Hub
- Azure Functions

Answer Area

Synapse Analytics	Provides a cloud-based Enterprise Data Warehouse (EDW).
Azure Machine Learning	Uses past trainings to provide predictions that have high probability.
Azure Functions	Provides serverless computing functionalities.
Azure IoT Hub	Processes data from millions of sensors.

Answer:

Azure Services	Answer Area	
	Azure Synapse Analytics	Provides a cloud-based Enterprise Data Warehouse (EDW).
	Azure Machine Learning	Uses past trainings to provide predictions that have high probability.
	Azure Functions	Provides serverless computing functionalities.
	Azure IoT Hub	Processes data from millions of sensors.

Explanation:
Box 1: Azure SQL Synapse Analytics
Azure SQL Synapse Analytics (previously called Data Warehouse) is a cloud-based Platform-as-a-Service (PaaS) offering from Microsoft. It is a large-scale, distributed, MPP (massively parallel processing) relational database technology in the same class of competitors as Amazon Redshift or Snowflake. Azure SQL Synapse Analytics is an important component of the Modern Data Warehouse multi-platform architecture. Because Azure SQL Synapse Analytics is an MPP system with a shared-nothing architecture across distributions, it is meant for large-scale analytical workloads which can take advantage of parallelism.
Box 2:
Azure Machine Learning uses past trainings to provide predictions that have high probability.
Machine learning is a data science technique that allows computers to use existing data to forecast future behaviors, outcomes, and trends. By using machine learning, computers learn without being explicitly programmed.
Forecasts or predictions from machine learning can make apps and devices smarter. For example, when you shop online, machine learning helps recommend other products you might want based on what you've bought.
Box 3:
Azure Functions provides serverless computing functionalities.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.
Box 4:
IoT Hub (Internet of things Hub) provides data from millions of sensors.
IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.

Reference:
https://azure.microsoft.com/en-gb/services/synapse-analytics/ https://docs.microsoft.com/en-us/azure/machine-learning/overview-what-is-azure-ml https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub https://docs.microsoft.com/en-us/azure/azure-functions/functions-overview

Question: 181 CertyIQ

You have an Azure environment.
You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
What are three possible solutions? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Use Bash in Azure Cloud Shell.
B. Use PowerShell in Azure Cloud Shell.
C. Use the PowerApps portal.
D. Use the Security & Compliance admin center.
E. Use the Azure portal.

Answer: ABE

Explanation:
The Android tablet device will have a web browser (Chrome). That's enough to connect to the Azure portal.
The Azure portal offers three ways to create a VM:
- Using the graphical portal.
- Using the Azure Cloud Shell using Bash.
- Using the Azure Cloud Shell using PowerShell.

Question: 182 CertyIQ

A team of developers at your company plans to deploy, and then remove, 50 virtual machines each week. All the virtual machines are configured by using Azure Resource Manager templates.
You need to recommend which Azure service will minimize the administrative effort required to deploy and remove the virtual machines.
What should you recommend?

A. Azure Reserved Virtual Machine (VM) Instances
B. Azure DevTest Labs
C. Azure virtual machine scale sets
D. Azure Virtual Desktop

Answer: B

Explanation:
DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates.
By using DevTest Labs, you can test the latest versions of your applications by doing the following tasks:
- Quickly provision Windows and Linux environments by using reusable templates and artifacts.
- Easily integrate your deployment pipeline with DevTest Labs to provision on-demand environments.
- Scale up your load testing by provisioning multiple test agents and create pre-provisioned environments for training and demos.

Reference:
https://docs.microsoft.com/en-us/azure/lab-services/devtest-lab-overview

Question: 183 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Statement 1 (No): Azure Advisor provides recommendations for Azure subscription-level resources (e.g., VMs, storage, SQL databases, App Services) across five categories: Cost, Security, Reliability, Performance, and Operational Excellence. It does not evaluate tenant-level identity directory configurations (such as user accounts, conditional access, and password policies for Azure AD / Microsoft Entra ID). Identity and directory security recommendations are provided by Microsoft Entra Identity Protection and Microsoft Entra Secure Score.

Statement 3 (No): Azure Advisor provides performance, reliability, and security recommendations (e.g., applying NSG rules or restricting public endpoints via Defender for Cloud recommendations), but it does not act as a general network configuration wizard or recommend general network settings (e.g., configuring private IP addresses, DNS servers, routing tables) for virtual machines.

Answer Area

Statements	Yes	No
Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment.	○	○
Azure Advisor provides recommendations on how to reduce the cost of running Azure virtual machines.	○	○
Azure Advisor provides recommendations on how to configure the network settings on Azure virtual machines.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment.	○	○
Azure Advisor provides recommendations on how to reduce the cost of running Azure virtual machines.	○	○
Azure Advisor provides recommendations on how to configure the network settings on Azure virtual machines.	○	○

Explanation:

Box 1: No -

Azure Advisor provides you with a consistent, consolidated view of recommendations for all your Azure resources. It integrates with Azure Security Center to bring you security recommendations. You can get security recommendations from the Security tab on the Advisor dashboard. Examples of recommendations include restricting access to virtual machines by configuring Network Security Groups, enabling storage encryption, installing vulnerability assessment solutions.
However, Azure Advisor does not provide recommendations on how to improve the security of an Azure AD environment.

Box 2: Yes -
Advisor helps you optimize and reduce your overall Azure spend by identifying idle and underutilized resources. You can get cost recommendations from the Cost tab on the Advisor dashboard.
Box 3: No.
Azure Advisor does not provide recommendations on how to configure network settings on Azure virtual machines.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-security-recommendations
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations

Question: 184 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From the Azure portal, launch Azure Cloud Shell and select PowerShell. Run the command in Cloud Shell.
Does this meet the goal?

A. Yes
B. No

The provided command (az vm create ...) is an Azure CLI command.

Azure Cloud Shell comes with both Azure CLI and Azure PowerShell pre-installed and authenticated by default.

Answer: A

Explanation:

In Azure Cloud Shell, whether you select the Bash or the PowerShell environment, the underlying host container supports executing external CLI binaries. The az executable is directly accessible in the PATH of the PowerShell Cloud Shell environment, meaning Azure CLI commands run without issue inside Cloud Shell's PowerShell session.

The command can be run in the Azure Cloud Shell. Although this question says you select PowerShell rather than Bash, the Az commands will work in

PowerShell.

The Azure Cloud Shell is a free interactive shell. It has common Azure tools preinstalled and configured to use with your account.

To open the Cloud Shell, just select Try it from the upper right corner of a code block. You can also launch Cloud Shell in a separate browser tab by going to https://shell.azure.com/bash.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machines/linux/quick-create-cli

Question: 185 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS
--generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From a computer that runs Windows 10, install Azure CLI. From PowerShell, sign in to Azure and then run the command.
Does this meet the goal?

A. Yes
B. No

The Azure CLI (az) is a cross-platform command-line executable that can be installed on Windows (including Windows 10), macOS, and Linux.

When installed on Windows, the az executable is added to the system PATH. Any command shell—including PowerShell or Command Prompt (cmd.exe)—can launch and execute az commands directly.

Answer: A

Explanation:
Signing in to Azure from PowerShell using the Azure CLI (az login) sets the active subscription context to Subscription1 (or allows selecting it). Executing the command from that session successfully provisions VM1 in RG1 within Subscription1
The command can be run from PowerShell or the command prompt if you have the Azure CLI installed.

Reference:
https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-windows?view=azure-cli-latest

Question: 186 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS
--generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From a computer that runs Windows 10, install Azure CLI. From a command prompt, sign in to Azure and then run the command.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
The command can be run from PowerShell or the command prompt if you have the Azure CLI installed.

Reference:
https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-windows?view=azure-cli-latest

Question: 187 CertyIQ

HOTSPOT -
Several support engineers plan to manage Azure by using the computers shown in the following table:

Name	Operating system
Computer1	Windows 10
Computer2	Ubuntu
Computer3	MacOS Mojave

You need to identify which Azure management tools can be used from each computer.
What should you identify for each computer? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Computer1:

- The Azure CLI and the Azure portal
- The Azure portal and Azure PowerShell
- The Azure CLI and Azure PowerShell
- The Azure CLI, the Azure portal, and Azure PowerShell

Computer2:

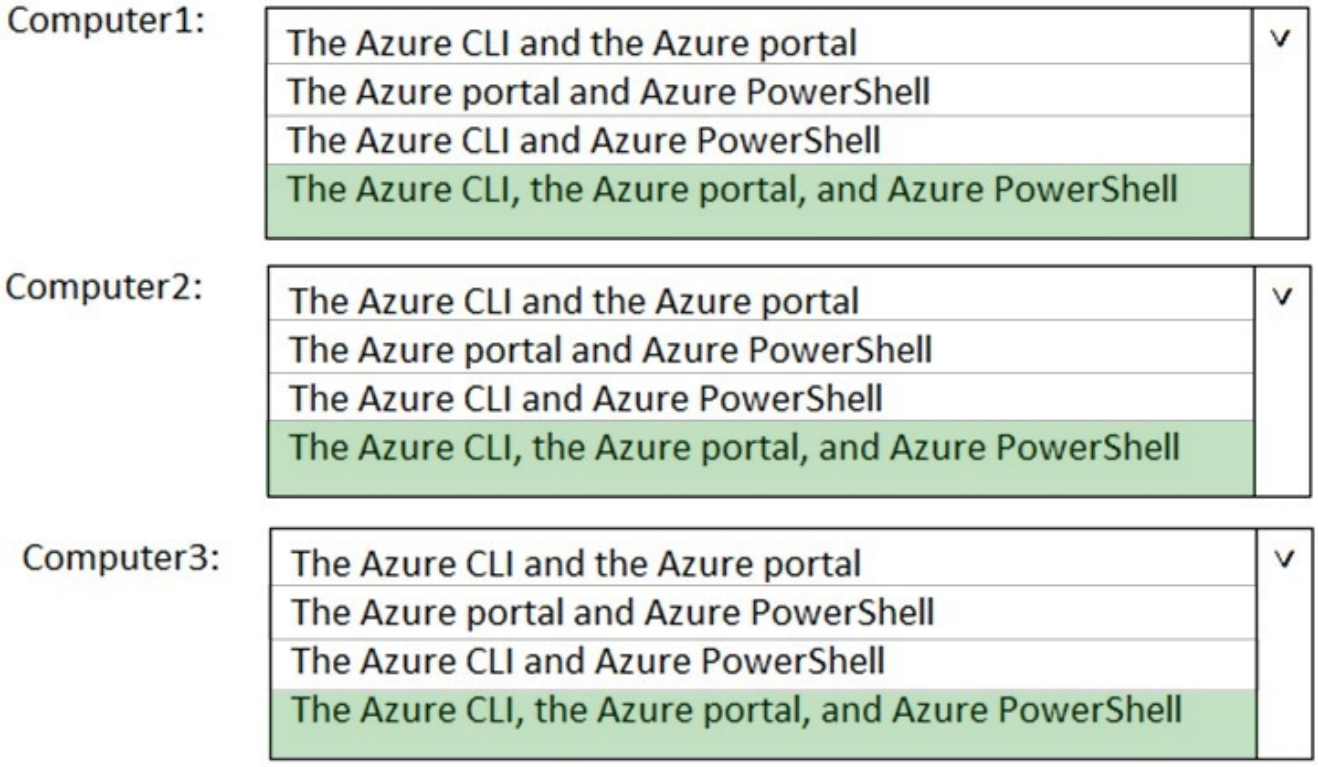
- The Azure CLI and the Azure portal
- The Azure portal and Azure PowerShell
- The Azure CLI and Azure PowerShell
- The Azure CLI, the Azure portal, and Azure PowerShell

Computer3:

- The Azure CLI and the Azure portal
- The Azure portal and Azure PowerShell
- The Azure CLI and Azure PowerShell
- The Azure CLI, the Azure portal, and Azure PowerShell

Answer:

Answer Area



Explanation:
Previously, the Azure CLI (or x-plat CLI) was the only option for managing Azure subscriptions and resources from the command-line on Linux and macOS. Now with the open source and cross-platform release of PowerShell, you'll be able to manage all your Azure resources from Windows, Linux and macOS using your tool of choice, either the Azure CLI or Azure PowerShell cmdlets.
The Azure portal runs in a web browser so can be used in either operating system.

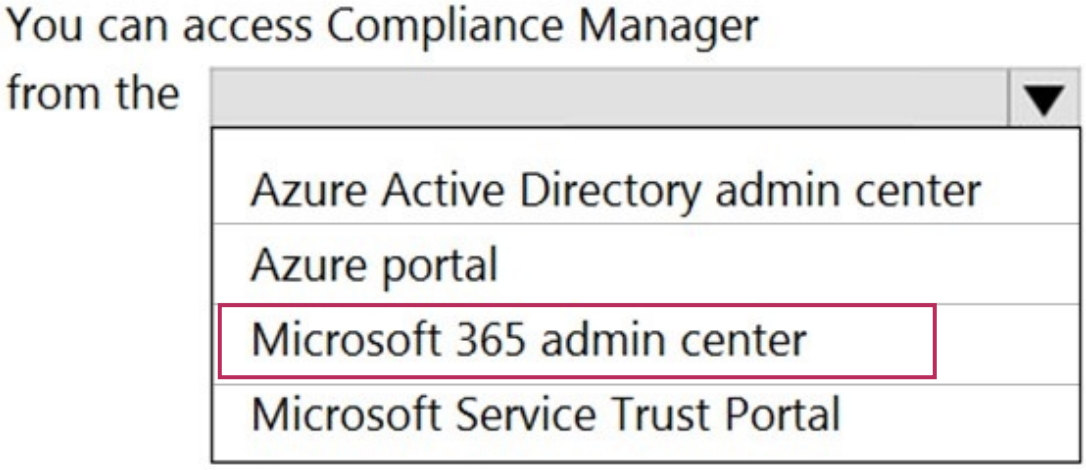
https://buildazure.com/2016/08/18/powershell-now-open-source-and-cross-platform-linux-macos-windows/

Question: 188

CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Answer Area

Explanation:

Microsoft 365 Admin Center.

"Compliance Manager has moved from the Service Trust Portal to its new location in the Microsoft 365 compliance center. All customer data has been moved over to the new location, so you can continue using Compliance Manager without interruption. Refer to the Compliance Manager documentation for setup information and to learn about new features. Although the classic version of Compliance Manager remains in the Service Trust Portal, all users are encouraged to use Compliance Manager in the Microsoft 365 compliance center."

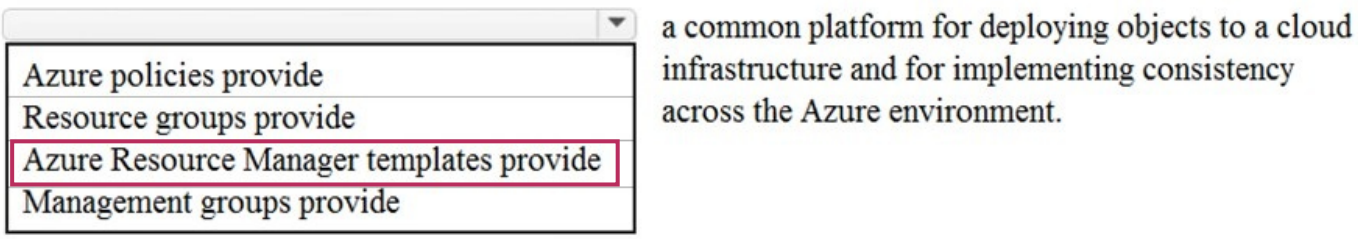
Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

Question: 189 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Answer Area

Azure policies provide Resource groups provide Azure Resource Manager templates provide Management groups provide	a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the Azure environment.

Explanation:
Azure Resource Manager templates provides a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the
Azure environment.
Azure policies are used to define rules for what can be deployed and how it should be deployed. Whilst this can help in ensuring consistency, Azure policies do not provide the common platform for deploying objects to a cloud infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 190 CertyIQ

DRAG DROP -
Match the Azure service to the correct description.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:

Answer Options	Answer Area	
Azure Machine Learning	Bot Services	Provides a digital online assistant that provides speech support
Azure IoT Hub	Machine Learning	Uses past trainings to provide predictions that have high probability
Azure Bot Services	Azure Functions	Provides serverless computing functionalities
Azure Functions	IoT Hub	Processes data from millions of sensors

Answer:

Answer Options	Answer Area	
Azure Machine Learning	Azure Bot Services	Provides a digital online assistant that provides speech support
Azure IoT Hub	Azure Machine Learning	Uses past trainings to provide predictions that have high probability
Azure Bot Services	Azure Functions	Provides serverless computing functionalities
Azure Functions	Azure IoT Hub	Processes data from millions of sensors

Explanation:

Box 1:
Azure Bot Services provides a digital online assistant that provides speech support.
Bots provide an experience that feels less like using a computer and more like dealing with a person - or at least an intelligent robot. They can be used to shift simple, repetitive tasks, such as taking a dinner reservation or gathering profile information, on to automated systems that may no longer require direct human intervention. Users converse with a bot using text, interactive cards, and speech. A bot interaction can be a quick question and answer, or it can be a sophisticated conversation that intelligently provides access to services.
Box 2:
Azure Machine Learning uses past trainings to provide predictions that have high probability.
Machine learning is a data science technique that allows computers to use existing data to forecast future behaviors, outcomes, and trends. By using machine learning, computers learn without being explicitly programmed.
Forecasts or predictions from machine learning can make apps and devices smarter. For example, when you shop online, machine learning helps recommend other products you might want based on what you've bought.
Box 3:
Azure Functions provides serverless computing functionalities.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.
Box 4:
IoT Hub (Internet of things Hub) provides data from millions of sensors.
IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.

Reference:
https://docs.microsoft.com/en-us/azure/bot-service/bot-service-overview-introduction?view=azure-bot-service-4.0 https://docs.microsoft.com/en-us/azure/machine-learning/overview-what-is-azure-ml https://docs.microsoft.com/en-us/azure/azure-functions/ https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub

Question: 191 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs Windows 10 and has the Azure PowerShell module installed.
Does this meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.

In this question, the computer has the Azure PowerShell module installed. Therefore, this solution does meet the goal.

References:

https://docs.microsoft.com/en-us/powershell/scripting/components/ise/how-to-write-and-run-scripts-in-the-windows-powershell-ise?view=powershell-6

Question: 192 CertyIQ

DRAG DROP -
Match the Azure services to the correct description.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:

Services	Answer Area	
Azure Functions	Virtual Machines	Provide operating system virtualization
Azure App Service	Container Instances	Provide portable environment for virtualized applications
Azure virtual machines	App Service	Used to build, deploy, and scale web apps
Azure Container Instances	Azure Functions	Provide a platform for serverless code

Answer:

Services	Answer Area	
	Azure virtual machines	Provide operating system virtualization
	Azure Container Instances	Provide portable environment for virtualized applications
	Azure App Service	Used to build, deploy, and scale web apps
	Azure Functions	Provide a platform for serverless code

Explanation:
Box 1:
Azure virtual machines provide operation system virtualization.
Azure Virtual Machines (VM) is one of several types of on-demand, scalable computing resources that Azure offers. Typically, you choose a VM when you need more control over the computing environment than the other choices offer.
Box 2:
Azure Container Instances provide portable environments for virtualized applications.
Containers are becoming the preferred way to package, deploy, and manage cloud applications. Azure Container Instances offers the fastest and simplest way to run a container in Azure, without having to manage any virtual machines and without having to adopt a higher-level service.
Containers offer significant startup benefits over virtual machines (VMs). Azure Container Instances can start containers in Azure in seconds, without the need to provision and manage VMs.
Box 3:

Azure App Service is used to build, deploy and scale web apps.
Azure App Service is a platform-as-a-service (PaaS) offering that lets you create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises. App Service includes the web and mobile capabilities that were previously delivered separately as Azure Websites and Azure Mobile Services.
Box 4:
Azure Functions provide a platform for serverless code.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/overview https://docs.microsoft.com/en-us/azure/security/fundamentals/paas-applications-using-app-services https://docs.microsoft.com/en-us/azure/azure-functions/ https://docs.microsoft.com/en-us/azure/container-instances/container-instances-overview

Question: 193 CertyIQ

Which service provides serverless computing in Azure?

A. Azure Virtual Machines
B. Azure Functions
C. Azure storage account
D. Azure dedicated hosts

Answer: B

Explanation:
Azure Functions provide a platform for serverless code.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/azure-functions/

Question: 194 CertyIQ

An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Which three computers can run the script? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. a computer that runs macOS and has PowerShell Core 6.0 installed.
B. a computer that runs Windows 10 and has the Azure PowerShell module installed.
C. a computer that runs Linux and has the Azure PowerShell module installed.
D. a computer that runs Linux and has the Azure CLI tools installed.
E. a computer that runs Chrome OS and uses Azure Cloud Shell.

Answer: BCE

Explanation:

A: wrong, you need Azure Powershell Module, Powershell only isn't enough

B: correct, you have Powershell and the module to create Azure resources

C: correct, you have Powershell and the module to create Azure resources

D: wrong, with Azure CLI you don't execute Powershell script

E: correct, from a browser you can connect to Azure Portal and execute Azure Powershell comdlet

Question: 195 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From the Azure portal, launch Azure Cloud Shell and select Bash. Run the command in Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:

The command can be run in the Azure Cloud Shell.

The Azure Cloud Shell is a free interactive shell. It has common Azure tools preinstalled and configured to use with your account.

To open the Cloud Shell, just select Try it from the upper right corner of a code block. You can also launch Cloud Shell in a separate browser tab by going to https://shell.azure.com/bash.

While using the command subscription is not mentioned and some of us would look why subscription command was not used however all details mentioned in question was mentioned. For creating a virtual machine though power shall or bas, there is no requirement to put the subscription details. Name of VM and resource group are sufficient to create a vm.

References:

https://docs.microsoft.com/en-us/azure/virtual-machines/linux/quick-create-cli

Question: 196 CertyIQ

Your company has several business units.
Each business unit requires 20 different Azure resources for daily operation. All the business units require the

same type of Azure resources.
You need to recommend a solution to automate the creation of the Azure resources.
What should you include in the recommendations?

A. Azure Resource Manager templates
B. virtual machine scale sets
C. the Azure API Management service
D. management groups

Answer: A

Explanation:
You can use Azure Resource Manager templates to automate the creation of the Azure resources. Deploying resource through templates is known as
'Infrastructure as code'.
To implement infrastructure as code for your Azure solutions, use Azure Resource Manager templates. The template is a JavaScript Object Notation (JSON) file that defines the infrastructure and configuration for your project. The template uses declarative syntax, which lets you state what you intend to deploy without having to write the sequence of programming commands to create it. In the template, you specify the resources to deploy and the properties for those resources.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

Question: 197

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can use Azure Cost Management to view costs associated to management groups.	○	○
You can use Azure Cost Management to view costs associated to resource groups.	○	○
You can use Azure Cost Management to view the usage of virtual machines during the last three months.	○	○

Answer:

Answer Area

Statements	Yes	No
You can use Azure Cost Management to view costs associated to management groups.	○	○
You can use Azure Cost Management to view costs associated to resource groups.	○	○
You can use Azure Cost Management to view the usage of virtual machines during the last three months.	○	○

Explanation:

Yes : Azure Cost Management allows you to view costs associated with management groups.

Yes : Azure Cost Management allows you to view costs associated with resource groups.

Yes : Azure Cost Management allows you to view the usage of VMs over a specified period, including the last three months.

Question: 198 CertyIQ

What can you use to identify underutilized or unused Azure virtual machines?

A. Azure Advisor

B. Azure Cost Management + Billing

C. Azure reservations

D. Azure Policy

Answer: A

Explanation:

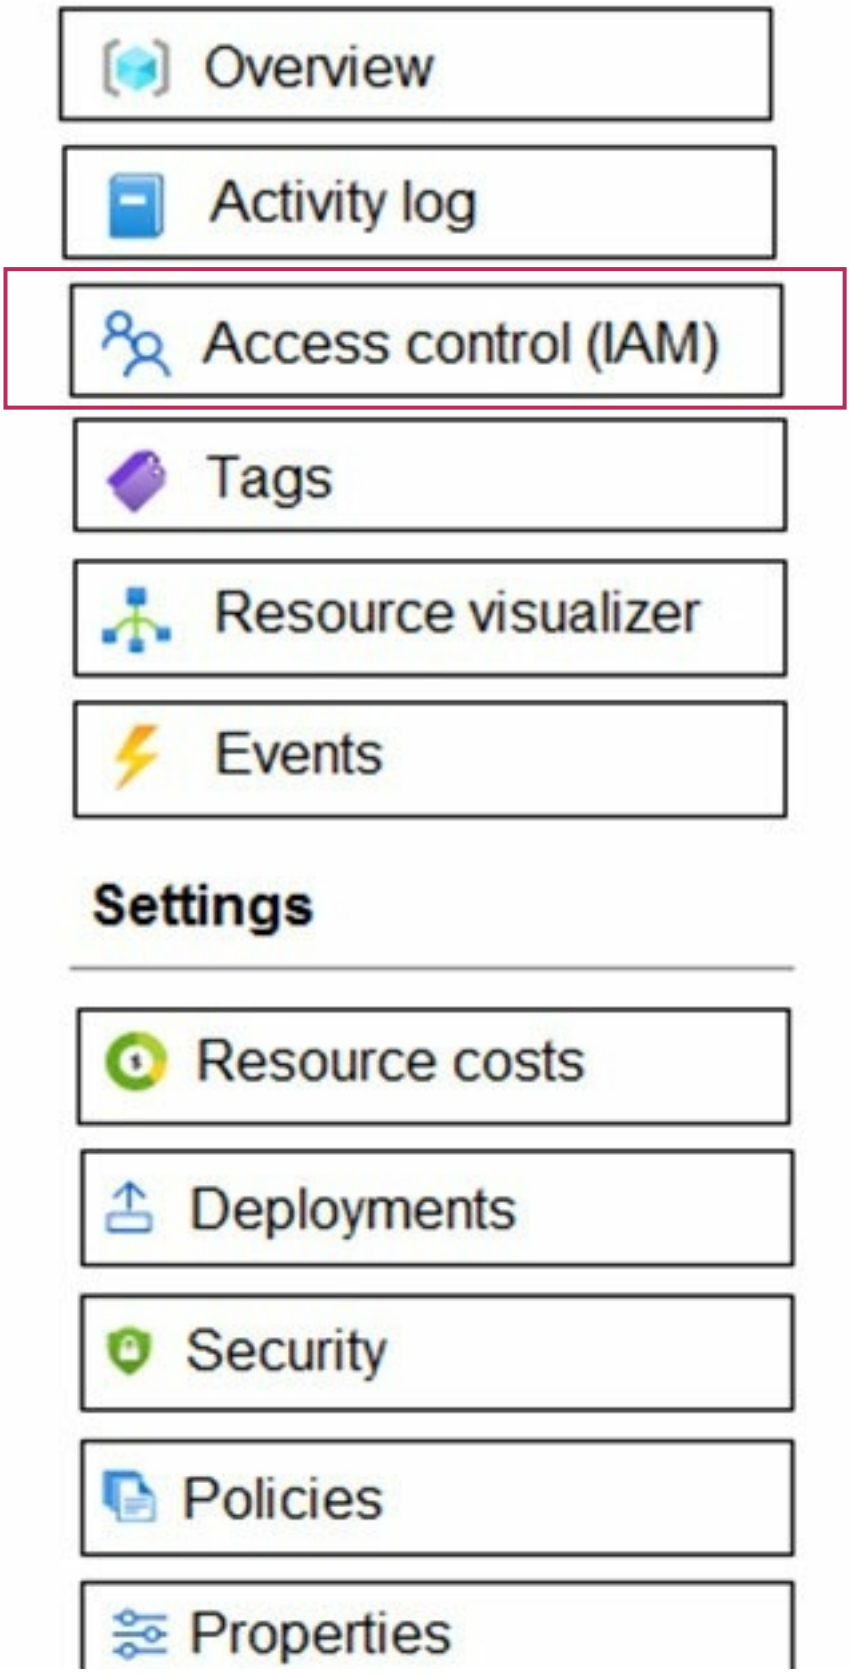
Azure Advisor helps you optimize and reduce your overall Azure spend by identifying idle and underutilized resources. You can get cost recommendations from the Cost tab on the Advisor dashboard.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-overview

Question: 199 CertyIQ

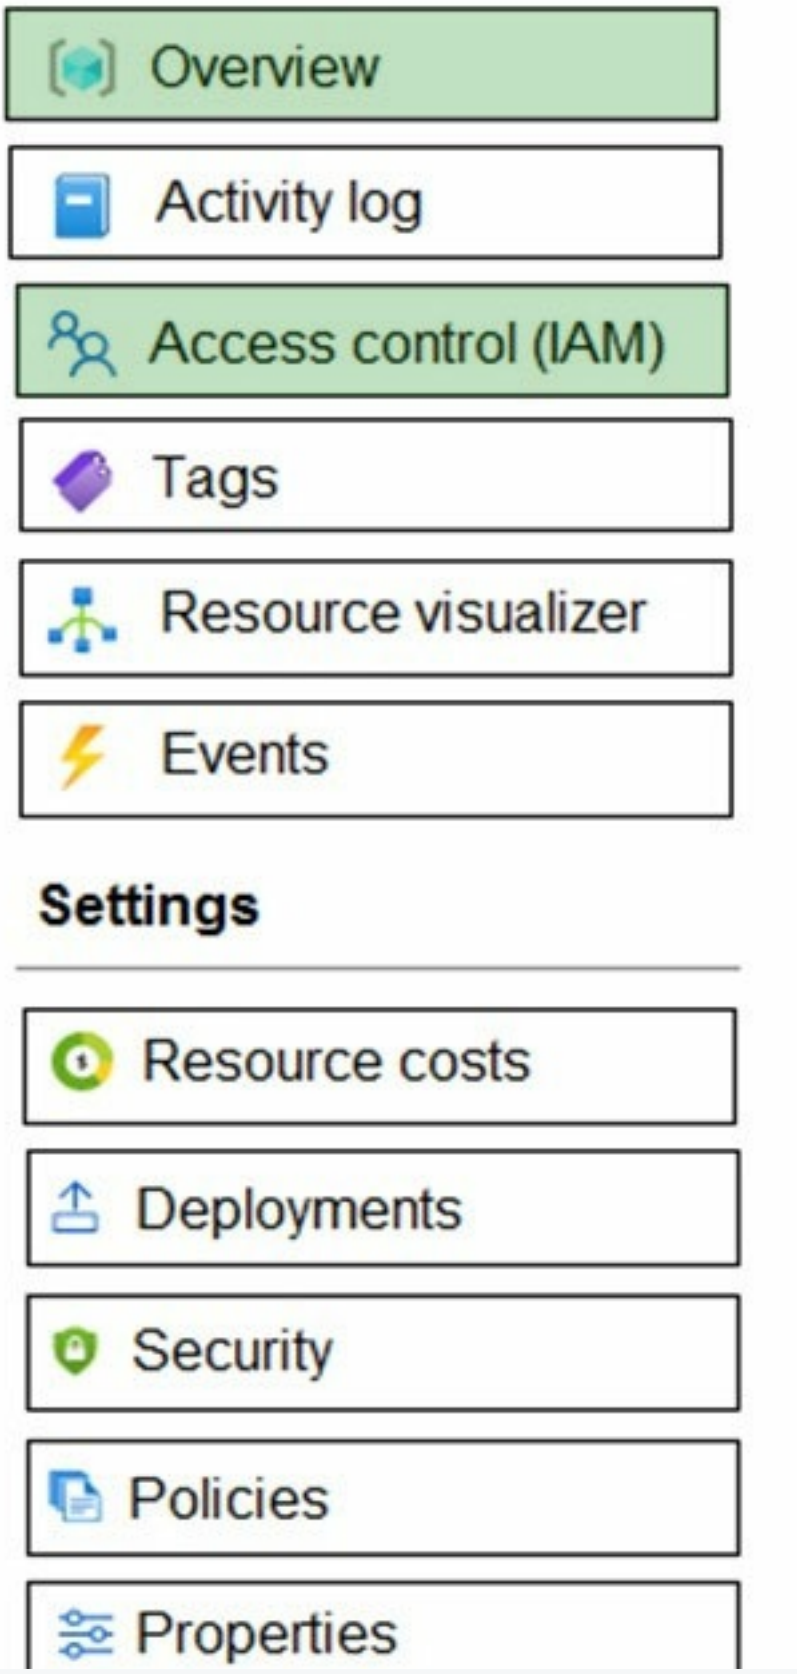
HOTSPOT -
Which node in the Azure portal should you use to assign a user the Reader role for a resource group? To answer, select the node in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

In Exam, you will get only one option to be selected, Please choose IAM in that case:

Correct Answer: Identity Acces amnagement is the answer (IAM)

Box 1: Overview -

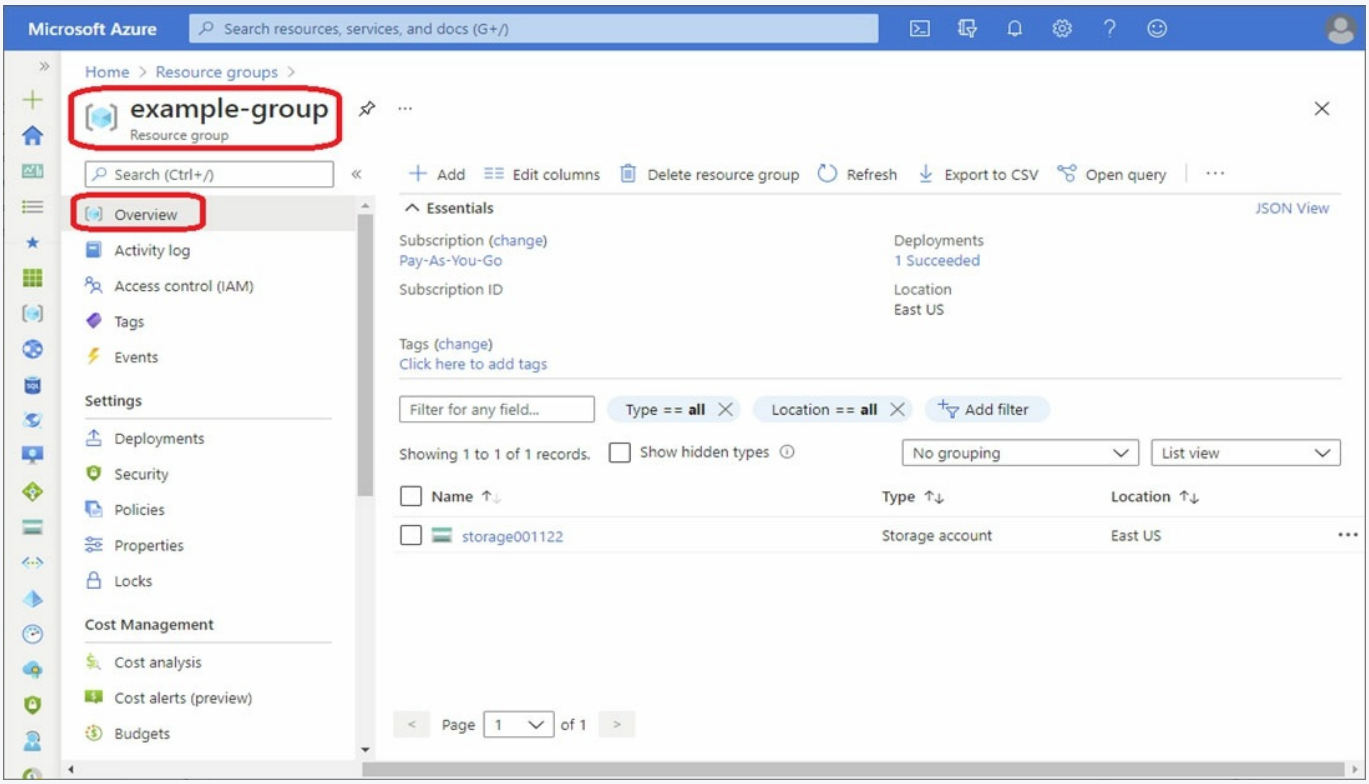
When you assign roles, you must specify a scope. Scope is the set of resources the access applies to. In Azure, you can specify a scope at four levels from broad to narrow: management group, subscription, resource group, and resource.

1. Sign in to the Azure portal.

2. In the Search box at the top, search for the scope you want to grant access to. For example, search for Management groups, Subscriptions, Resource groups, or a specific resource.

3. Click the specific resource for that scope.

4. The following shows an example resource group.



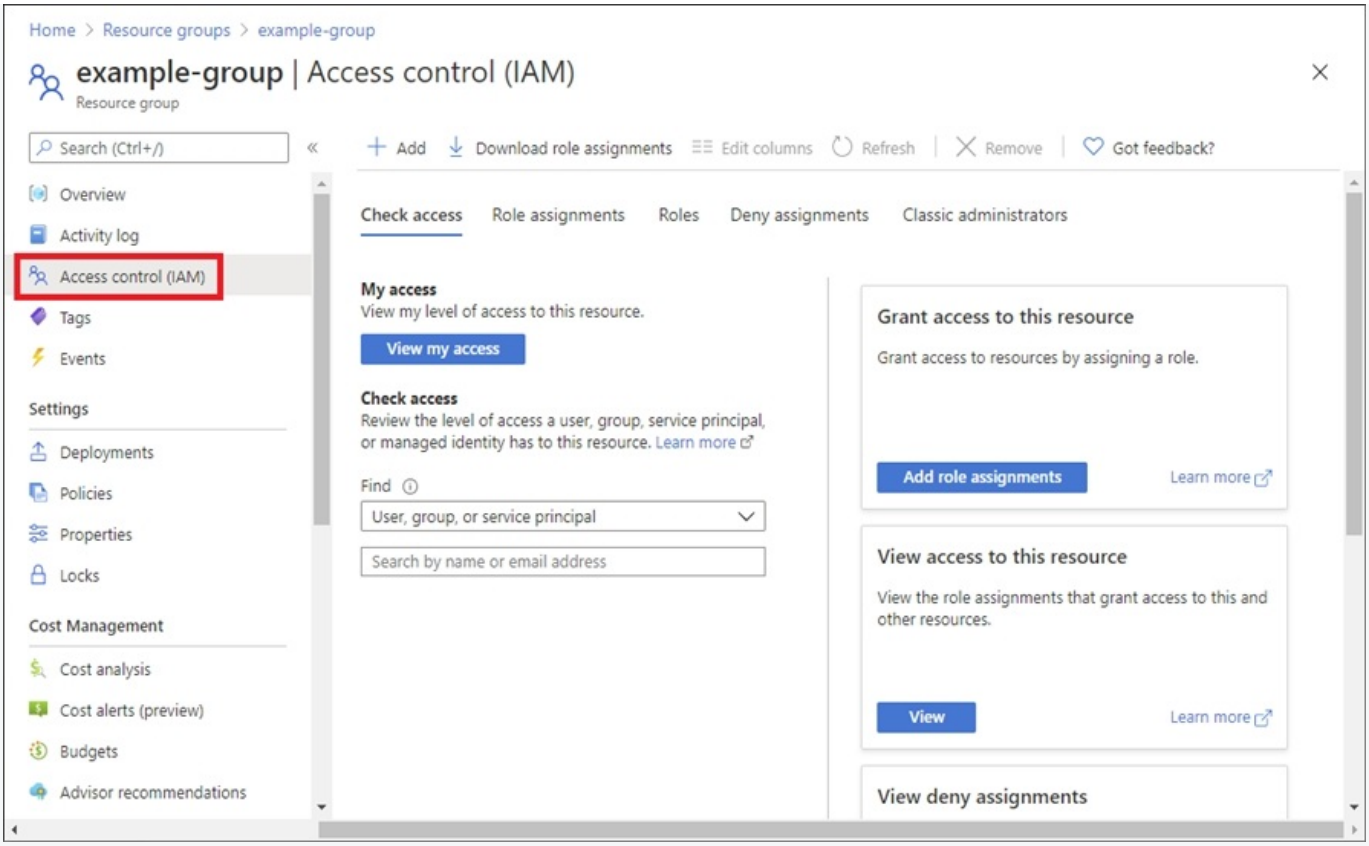
Box 2: Access control (IAM)

Access control (IAM) is the page that you typically use to assign roles to grant access to Azure resources. It's also known as identity and access management

(IAM) and appears in several locations in the Azure portal.

1. Click Access control (IAM).

The following shows an example of the Access control (IAM) page for a resource group.



2. Click the Role assignments tab to view the role assignments at this scope.

3. Click Add > Add role assignment.

If you don't have permissions to assign roles, the Add role assignment option will be disabled.

4. The Add role assignment page opens.

Reference:

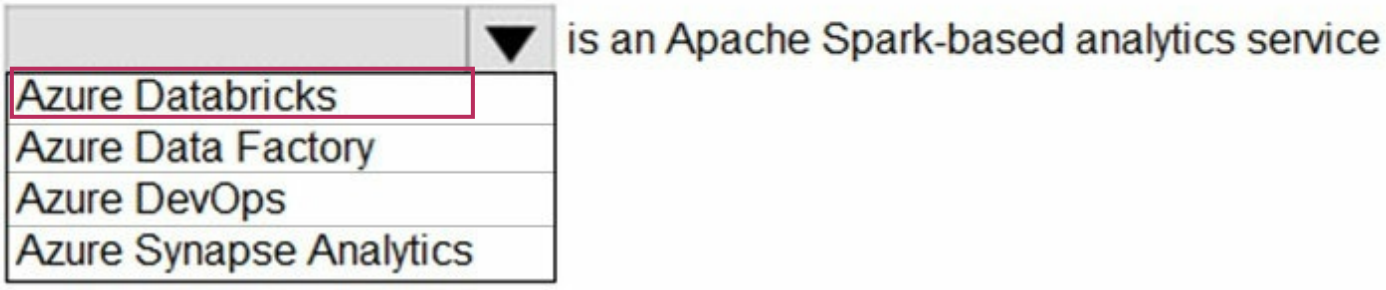
https://docs.microsoft.com/en-us/azure/role-based-access-control/role-assignments-portal

Question: 200

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area

Azure Databricks	is an Apache Spark-based analytics service
Azure Data Factory	
Azure DevOps	
Azure Synapse Analytics	

Explanation:
Box: Azure Databricks -
Azure Databricks is a fast, easy, and collaborative Apache Spark-based big data analytics service designed for data science and data engineering.

Reference:
https://azure.microsoft.com/en-us/services/databricks/

Question: 201 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You must have internet connectivity to manage cloud services.	○	○
You must install a management app to manage cloud services.	○	○
You can manage cloud services from any modern web browser.	○	○

Answer:

Answer Area

Statements	Yes	No
You must have internet connectivity to manage cloud services.	○	○
You must install a management app to manage cloud services.	○	○
You can manage cloud services from any modern web browser.	○	○

Explanation:

Box 1: Yes -

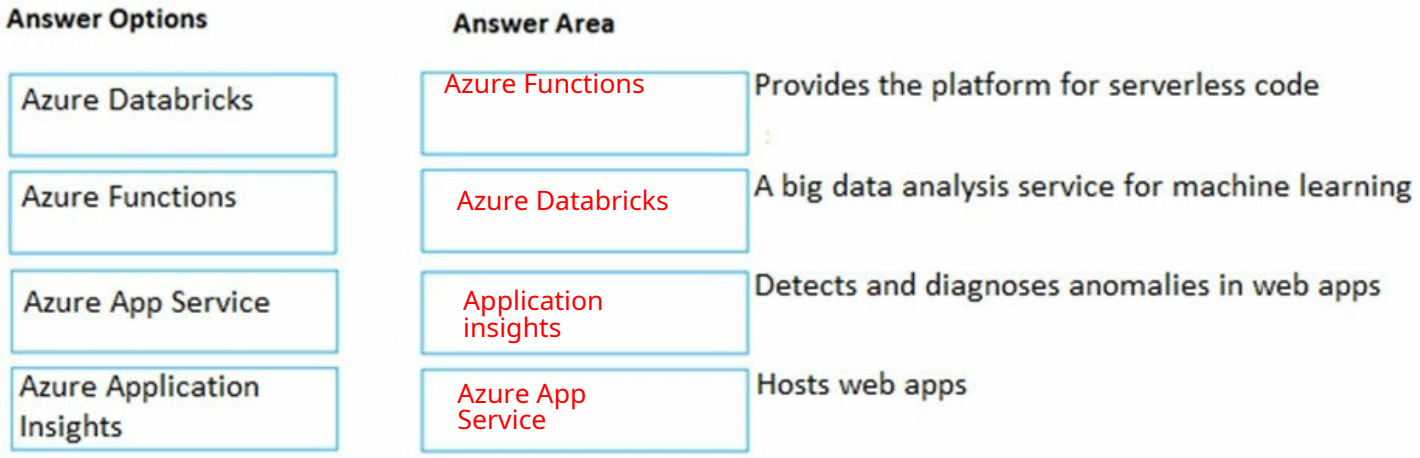
Box 2: No -
Cloud services can be managed through https://portal.azure.com/
In the Cloud Services area of the Azure portal, you can:
Update a service role or a deployment.
Promote a staged deployment to production.
Link resources to your cloud service so that you can see the resource dependencies and scale the resources together.
Delete a cloud service or a deployment.

Box 3: Yes -

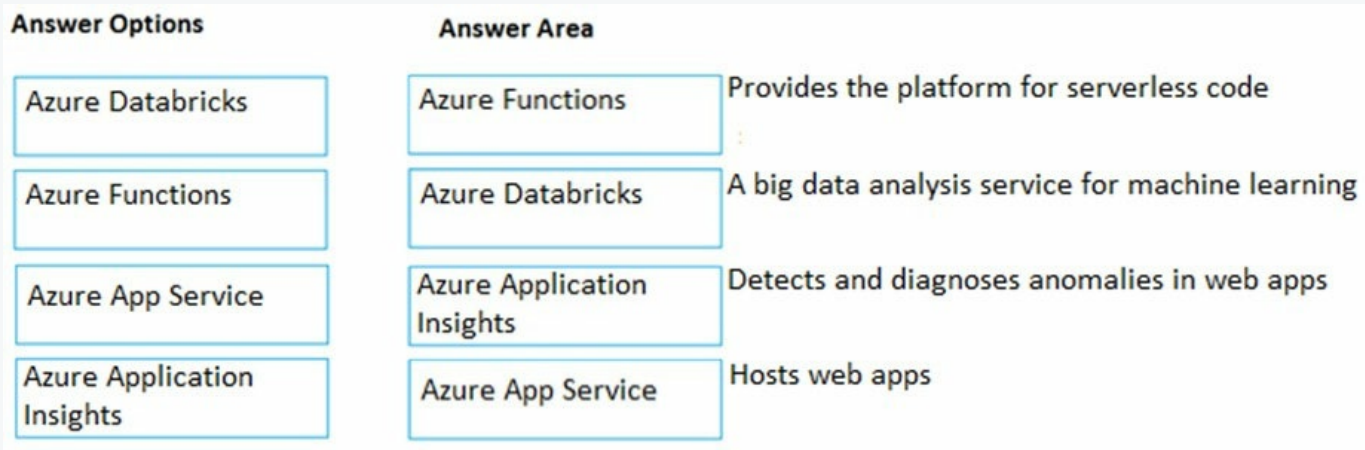
Reference:
https://docs.microsoft.com/en-us/azure/cloud-services/cloud-services-how-to-manage-portal

Question: 202 CertyIQ

DRAG DROP -
Match the Azure service to the correct definition.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:



Answer:



Explanation:

Serverless ---> Functions

big data analysis ---> Databricks

anomalies ---> Insights

Host ---> App Service

Box 1:

Azure Functions provides the platform for serverless code.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Box 2:

Azure Databricks is a big analysis service for machine learning.

Azure Databricks is an Apache Spark-based analytics platform. The platform consists of several components including 'MLib'. Mlib is a Machine Learning library consisting of common learning algorithms and utilities, including classification, regression, clustering, collaborative filtering, dimensionality reduction, as well as underlying optimization primitives.

Box 3:

Azure Application Insights detects and diagnoses anomalies in web apps.

Application Insights, a feature of Azure Monitor, is an extensible Application Performance Management (APM) service for developers and DevOps professionals.

Use it to monitor your live applications. It will automatically detect performance anomalies, and includes powerful analytics tools to help you diagnose issues and to understand what users actually do with your app.

Box 4:

Azure App Service hosts web apps.

Azure App Service is an HTTP-based service for hosting web applications, REST APIs, and mobile back ends. You can develop in your favorite language, be it

.NET, .NET Core, Java, Ruby, Node.js, PHP, or Python. Applications run and scale with ease on both Windows and Linux-based environments.

References:

Question: 203 CertyIQ

A team of developers at your company plans to deploy, and then remove, 50 customized virtual machines each week. Thirty of the virtual machines run Windows
Server 2016 and 20 of the virtual machines run Ubuntu Linux.
You need to recommend which Azure service will minimize the administrative effort required to deploy and remove the virtual machines.
What should you recommend?

A. Azure Reserved Virtual Machines (VM) Instances
B. Azure virtual machine scale sets
C. Azure DevTest Labs
D. Microsoft Managed Desktop

Answer: C

Explanation:
DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates.
By using DevTest Labs, you can test the latest versions of your applications by doing the following tasks:
- Quickly provision Windows and Linux environments by using reusable templates and artifacts.
- Easily integrate your deployment pipeline with DevTest Labs to provision on-demand environments.
- Scale up your load testing by provisioning multiple test agents and create pre-provisioned environments for training and demos.

Reference:
https://docs.microsoft.com/en-us/azure/lab-services/devtest-lab-overview

Question: 204

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure PowerShell modules can be installed on macOS.	○	○
Azure Cloud Shell can be accessed from a web browser on a Linux computer.	○	○
The Azure portal can only be accessed from a Windows device.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure PowerShell modules can be installed on macOS.	◯	◯
Azure Cloud Shell can be accessed from a web browser on a Linux computer.	◯	◯
The Azure portal can only be accessed from a Windows device.	◯	◯

Explanation:

You can install the Az PowerShell module locally on Windows, macOS, and Linux. It can also be used from a browser through Azure Cloud Shell or inside a

Docker container.

Reference:

https://docs.microsoft.com/en-us/powershell/azure/what-is-azure-powershell?view=azps-6.6.0
https://serverfault.com/questions/323973/how-do-i-access-the-windows-azure-management-portal-from-ubuntu

Question: 205 CertyIQ

A support engineer plans to perform several Azure management tasks by using the Azure CLI.
You install the CLI on a computer.
You need to tell the support engineer which tools to use to run the CLI.
Which two tools should you instruct the support engineer to use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Command Prompt
B. Azure Resource Explorer
C. Windows PowerShell
D. Windows Defender Firewall
E. Network and Sharing Center

Answer: AC

Explanation:
For Windows the Azure CLI is installed via an MSI, which gives you access to the CLI through the Windows Command Prompt (CMD) or PowerShell.

Reference:
https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-windows?view=azure-cli-latest

Question: 206 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use PowerShell in Azure Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
Azure Cloud Shell is a browser-based shell experience to manage and develop Azure resources.
Cloud Shell offers a browser-accessible, pre-configured shell experience for managing Azure resources without the overhead of installing, versioning, and maintaining a machine yourself.
Being browser-based, Azure Cloud Shell can be run on a browser from a tablet that runs the Android operating system.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-shell/features

Question: 207 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use the PowerApps portal.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

powerapp:website

azure portal:vm

PowerApps lets you quickly build business applications with little or no code. It is not used to create Azure virtual machines. Therefore, this solution does not meet the goal.

PowerApps Portals allow organizations to create websites which can be shared with users external to their organization either anonymously or through the login provider of their choice like LinkedIn, Microsoft Account,

other commercial login providers.

References:

https://powerapps.microsoft.com/en-us/blog/introducing-powerapps-portals-powerful-low-code-websites-for-external-users/

Question: 208 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use the Azure portal.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
The Azure portal is a web-based, unified console that provides an alternative to command-line tools. With the Azure portal, you can manage your Azure subscription using a graphical user interface. You can build, manage, and monitor everything from simple web apps to complex cloud deployments. Create custom dashboards for an organized view of resources. Configure accessibility options for an optimal experience. Being web-based, the Azure portal can be run on a browser from a tablet that runs the Android operating system.

Reference:
https://docs.microsoft.com/en-us/azure/azure-portal/azure-portal-overview

Question: 209 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

The Microsoft 365 Compliance admin center
The Microsoft 365 Defender portal
Microsoft Defender for Cloud in the Azure portal
Microsoft Trust Center

provides in-depth information about security, privacy, compliance offerings, policies, and features across Microsoft cloud products.

Answer: Microsoft Trust Center: Microsoft's dedicated public-facing informational portal that details how Microsoft implements and supports security, privacy, compliance offerings, transparency, and data protection policies across all Microsoft cloud products and services (Azure, Microsoft 365, Dynamics 365, Power Platform).

Unlike administrative management tools or security dashboards that configure tenant settings, the Trust Center serves as an informational reference library containing compliance reports, regulatory documentation, security white papers, and privacy commitments.

Explanation:

Microsoft Trust Center"

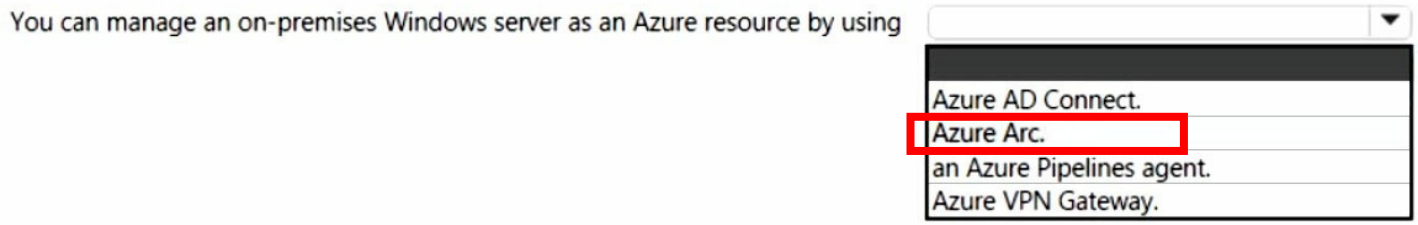
The Microsoft feature that provides in-depth information about security, privacy, compliance offerings, policies, and features across Microsoft cloud products is called the Microsoft Trust Center. The Trust Center is a centralized hub that offers comprehensive resources and documentation to help customers understand and evaluate the security and compliance capabilities of Microsoft Cloud services.

Question: 210

Once registered, the machine receives a Resource ID, can be placed into Resource Groups, tagged, audited/governed with Azure Policy, managed with Microsoft Defender for Cloud, and controlled via Azure RBAC just like a native Azure Virtual Machine.

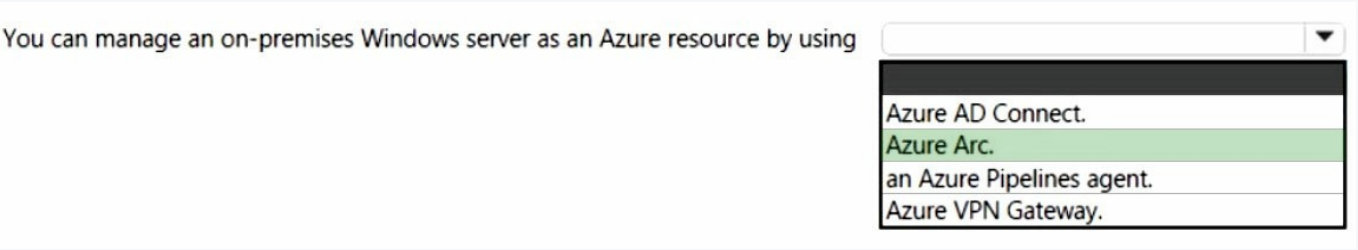
CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Azure Arc: Extends the Azure Resource Manager (ARM) control plane to hybrid and multi-cloud environments. By installing the Connected Machine agent on an on-premises Windows or Linux server, that server is registered as a first-class Azure resource.

Answer:



Explanation:
Azure Arc simplifies governance and management by delivering a consistent multi-cloud and on-premises management platform.
Azure Arc provides a centralized, unified way to:
Manage your entire environment together by projecting your existing non-Azure and/or on-premises resources into Azure Resource Manager.
Manage virtual machines, Kubernetes clusters, and databases as if they are running in Azure.
Etc.
Incorrect:
* Why use Azure AD Connect?
Integrating your on-premises directories with Azure AD makes your users more productive by providing a common identity for accessing both cloud and on- premises resources. Users and organizations can take advantage of:
Users can use a single identity to access on-premises applications and cloud services such as Microsoft 365.
Single tool to provide an easy deployment experience for synchronization and sign-in.
Provides the newest capabilities for your scenarios. Azure AD Connect replaces older versions of identity

integration tools such as DirSync and Azure AD Sync.
* VPN Gateway sends encrypted traffic between an Azure virtual network and an on-premises location over the public Internet. You can also use VPN Gateway to send encrypted traffic between Azure virtual networks over the Microsoft network. A VPN gateway is a specific type of virtual network gateway.
* Pipeline agent is machine where your build is performed. An agent is installable software that runs one job at a time. Agent job is a set of steps which is recognized as execution boundary. Each job runs on an agent. All of the steps run together on the same agent.

Reference:
https://docs.microsoft.com/en-us/azure/azure-arc/overview

Question: 211 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statements	Yes	No
You can only manage cloud services from Windows devices.	○	○
You can manage cloud services from the command line.	○	○
You can manage cloud services by using a web browser.	○	○

Answer:

Statements	Yes	No
You can only manage cloud services from Windows devices.	○	○
You can manage cloud services from the command line.	○	○
You can manage cloud services by using a web browser.	○	○

Explanation:

Box 1: No -

Easily manage your Azure storage accounts in the cloud, from Windows, macOS, or Linux, using Azure Storage Explorer.

Box 2: Yes -

Azure cloud services can be managed in Azure Automation by using the PowerShell cmdlets that are available in the Azure PowerShell tools.

Box 3: Yes -

>>>>>>>>>>>>>>>>>>>>>>

You can only manage cloud services from windows devices - No. You can connect to your Cloud PC on any platform that has either the Microsoft Remote Desktop app or an HTML5-capable browser to access the web client. Windows devices will provide the optimal experience

You can manage cloud services from the command line >> Yes

You can manage cloud services by using a web browser >> Yes . Microsoft Azure is an example of a public cloud. With a public cloud, all hardware, software and other supporting infrastructure is owned and managed by the cloud provider. You access these services and manage your account using a web browser.

>>>>>>>>>>>>>>>>>>>>>>>>

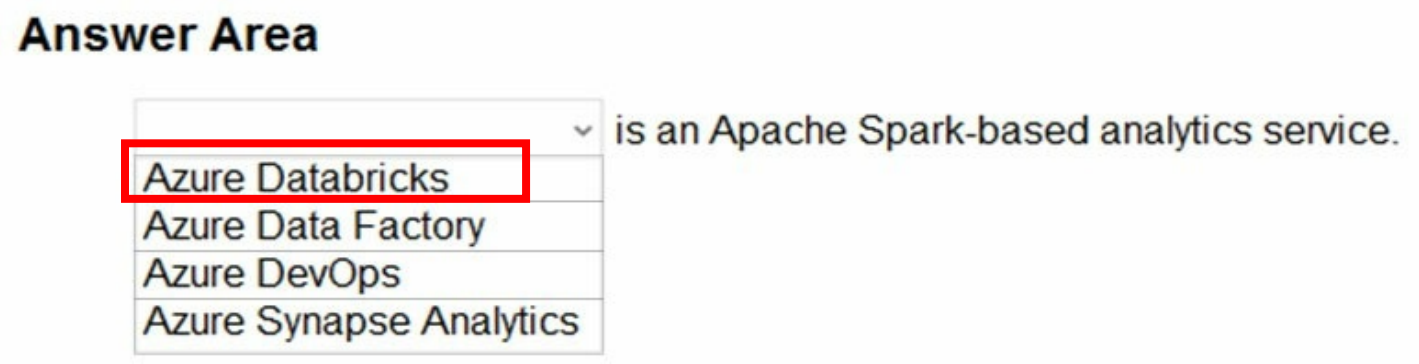
Reference:

https://azure.microsoft.com/en-us/features/storage-explorer/

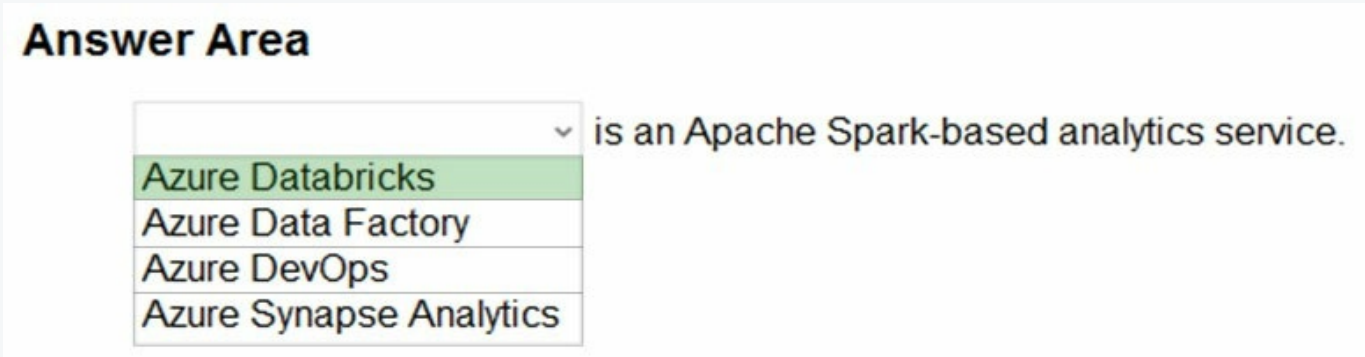
https://docs.microsoft.com/en-us/azure/cloud-services/automation-manage-cloud-services

Question: 212 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



Explanation:
Azure Databricks is an Apache Spark-based analytics platform. The platform consists of several components including 'MLib'. Mlib is a Machine Learning library consisting of common learning algorithms and utilities, including classification, regression, clustering, collaborative filtering, dimensionality reduction, as well as underlying optimization primitives.

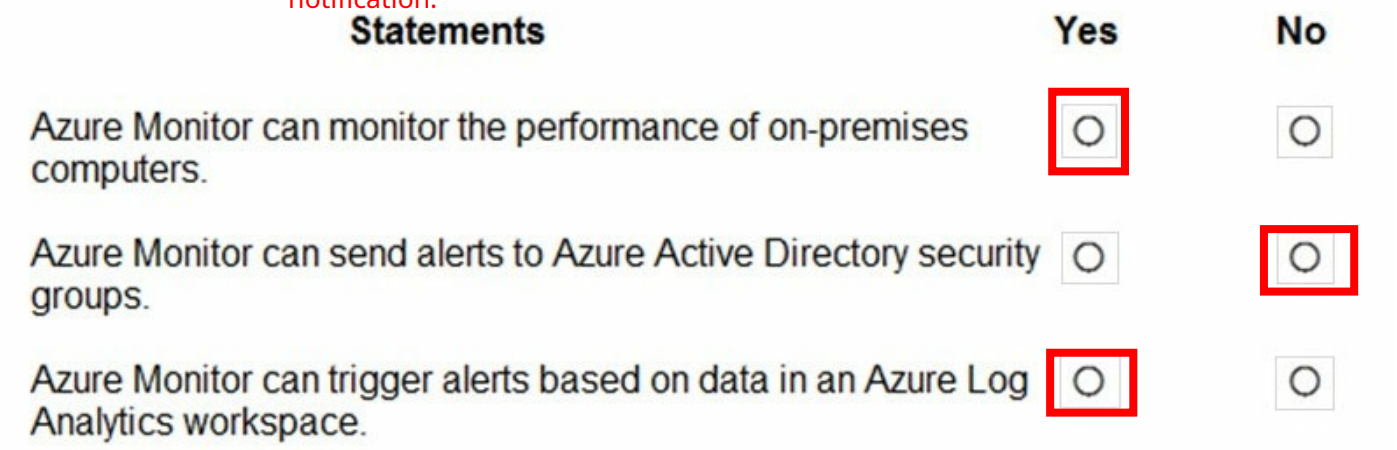
Reference:
https://docs.microsoft.com/en-us/azure/azure-databricks/what-is-azure-databricks#apache-spark-based-analytics-platform

Question: 213 CertyIQ

HOTSPOT -

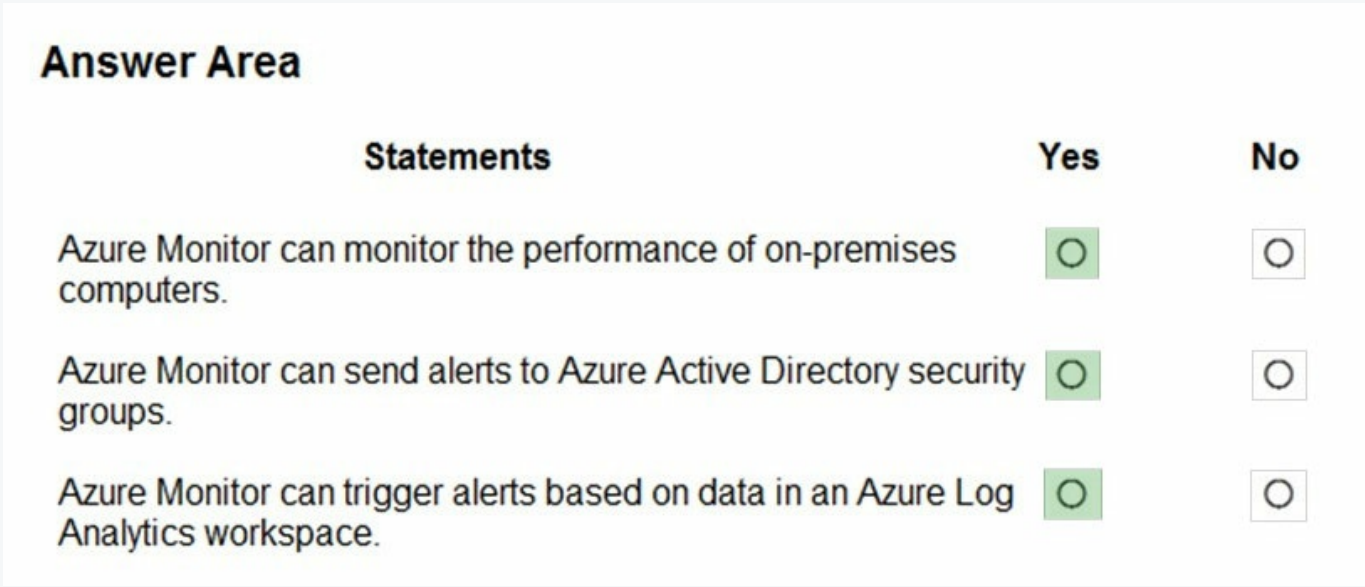
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Azure Monitor routes notifications through Action Groups. Action Groups support sending emails directly to individual email addresses, SMS, push notifications, voice, webhooks, or to members holding specific Azure Resource Manager (ARM) subscription roles (such as Owner, Contributor, or Monitoring Reader). However, you cannot directly target an Azure Active Directory (Microsoft Entra ID) security group as an alert destination in an Action Group notification.



Azure Monitor supports Log Alerts. These rules run scheduled queries written in KQL (Kusto Query Language) against data stored in an Azure Log Analytics workspace and fire an alert whenever the query result count or metric measurement exceeds specified threshold criteria.

Answer:



Explanation:

Box 1: Yes -

Azure Monitor maximizes the availability and performance of your applications and services by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments.

Box 2: Yes -

Alerts in Azure Monitor proactively notify you of critical conditions and potentially attempt to take corrective action.

Box 3: Yes -

Azure Monitor uses Target Resource, which is the scope and signals available for alerting. A target can be any Azure resource. Example targets: a virtual machine, a storage account, a virtual machine scale set, a Log Analytics workspace, or an Application Insights resource.

References:

https://docs.microsoft.com/en-us/azure/azure-monitor/overview https://docs.microsoft.com/en-us/azure/azure-monitor/platform/alerts-overview

Question: 214 CertyIQ

Which Azure service provides a set of version control tools to manage code?

A. Azure Repos
B. Azure DevTest Labs
C. Azure Storage
D. Azure Cosmos DB

Azure Repos: Part of Azure DevOps Services, providing private and public Git repositories (as well as Team Foundation Version Control / TFVC) for source code management. It includes branching, pull requests, code reviews, and semantic search to collaborate on and track code revisions.

Answer: A

Explanation:

A. Azure Repos.

Azure Repos is a service within Azure DevOps that provides a set of version control tools to manage code. It supports both Git repositories and Team Foundation Version Control (TFVC), allowing teams to collaborate on code development efficiently. The other options listed (Azure DevTest Labs, Azure Storage, and Azure Cosmos DB) are not primarily focused on version control or code management.

Azure Repos is a set of version control tools that you can use to manage your code.

Azure repo is a part of Azure DevOps

Incorrect Answers:

B: Azure DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates. These have all the necessary tools and software that you can use to create environments.

D: Azure Cosmos DB is Microsoft's globally distributed, multi-model database service.

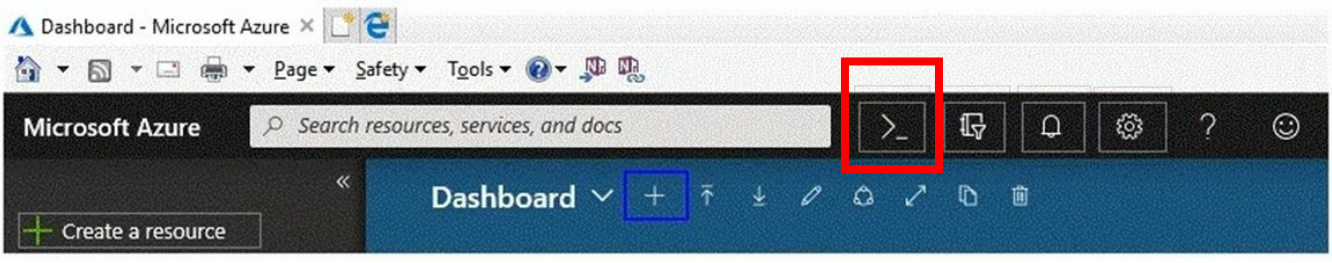
References:

https://docs.microsoft.com/en-us/azure/devops/repos/get-started/what-is-repos?view=azure-devops

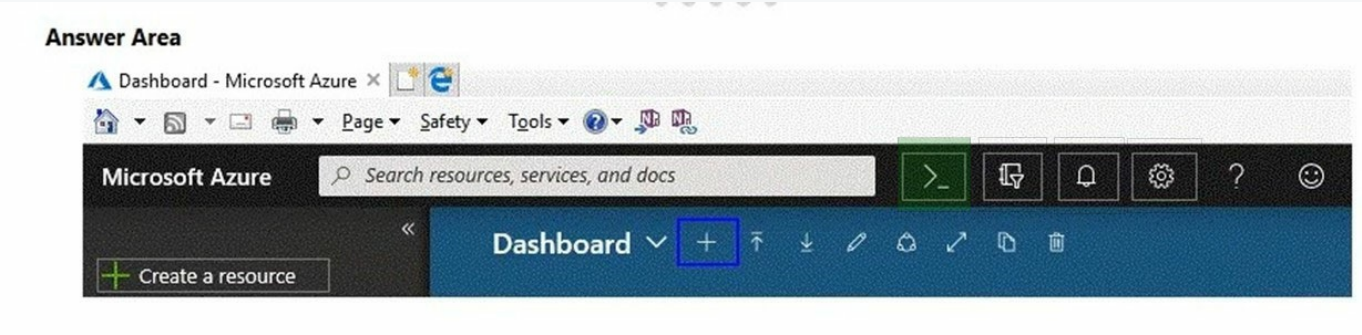
Question: 215 CertyIQ

HOTSPOT -
You need to manage Azure by using Azure Cloud Shell.
Which Azure portal icon should you select? To answer, select the appropriate icon in the answer area.
Hot Area:

Answer Area



Answer:



Explanation:

Select the button on top right side which is similar to ">-" signed.

You can access Azure Cloud Shell in the Azure portal by clicking the icon.

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

Cloud Shell enables access to a browser-based command-line experience built with Azure management tasks in mind.

References:

https://docs.microsoft.com/en-us/azure/cloud-shell/overview?view=azure-cli-latest

Question: 216 CertyIQ

You have a virtual machine named VM1 that runs Windows Server 2016. VM1 is in the East US Azure region.
Which Azure service should you use from the Azure portal to view service failure notifications that can affect the availability of VM1?

A. Azure Service Fabric
B. Azure Monitor
C. Azure virtual machines
D. Azure Advisor

Azure Monitor / Azure Service Health integration: In the Azure portal, platform-level service outage notifications, planned maintenance windows, and resource health degradation events are reported through Azure Service Health, which is exposed and managed directly under the Azure Monitor service suite (via Azure Monitor > Service Health or Resource Health).

Answer: B

Explanation:

Azure Monitor maximizes the availability and performance of your applications by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments. It helps you understand how your applications are performing and proactively identifies issues affecting them and the resources they depend on.

Service health notifications are published by the Azure infrastructure into the Azure activity log. The notifications contain information about the resources under your subscription.

View your service health notifications in the Azure portal

In the Azure portal, select Monitor.

Azure Monitor brings together all your monitoring settings and data into one consolidated view. It first opens to the Activity log section.

Select Alerts.

Select +Add activity log alert, and set up an alert to ensure you are notified for future service notifications

Question: 217 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify an Azure Traffic Manager profile.
Does this meet the goal?

A. Yes
B. No

Network Security Groups (NSGs): By default, Azure Virtual Machines in a Virtual Network are protected by NSGs, and the default inbound rule DenyAllInBound blocks all incoming traffic from the internet. To allow inbound HTTP traffic (port 80) to VM1, you must configure an inbound security rule on a Network Security Group (NSG) associated with VM1's network interface (NIC) or its subnet.

Traffic Manager Role: Azure Traffic Manager is a DNS-based traffic load balancer, not a proxy, firewall, or port filter. It resolves DNS requests to the best available endpoint based on routing methods, but it cannot override network filtering or open ports on a VM.

Answer: B

Explanation:
Azure Traffic Manager is a DNS-based load balancing solution. It is not used to ensure that a virtual machine named VM1 is accessible from the Internet over
HTTP.
To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.
In this question, we need to add a rule to a network security group or Azure Firewall to allow the connection to the virtual machine on port 80 (HTTP).

Reference:
https://docs.microsoft.com/en-us/azure/traffic-manager/traffic-manager-overview

Question: 218 CertyIQ

Your company plans to deploy several web servers and several database servers to Azure.
You need to recommend an Azure solution to limit the types of connections from the web servers to the database servers.
What should you include in the recommendation?

A. network security groups (NSGs)
B. Azure Service Bus
C. a local network gateway
D. a route filter

Network Security Groups (NSGs): By default, Azure Virtual Machines in a Virtual Network are protected by NSGs, and the default inbound rule DenyAllInBound blocks all incoming traffic from the internet. To allow inbound HTTP traffic (port 80) to VM1, you must configure an inbound security rule on a Network Security Group (NSG) associated with VM1's network interface (NIC) or its subnet.

Traffic Manager Role: Azure Traffic Manager is a DNS-based traffic load balancer, not a proxy, firewall, or port filter. It resolves DNS requests to the best available endpoint based on routing methods, but it cannot override network filtering or open ports on a VM.

Answer: A

Explanation:
A network security group works like a firewall. You can attach a network security group to a virtual network

and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 219 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

From [ ] you can view which user turned off a specific virtual machine during the last 14 days.

- Azure Access Control IAM
- Azure Event Hubs
- Azure Activity Log
- Azure Service Health

Azure Activity Log: A platform-level service that provides insight into subscription-level control-plane events. It captures auditing and operational information whenever a resource is created, updated, or deleted via Azure Resource Manager (ARM).

Turning off or deallocating a virtual machine generates an event in the Activity Log that records:

Activity Log entries are retained automatically by Azure for 90 days by default, easily covering the 14-day window specified in the question

Answer:

Answer Area

From [Azure Activity Log] you can view which user turned off a specific virtual machine during the last 14 days.

- Azure Access Control IAM
- Azure Event Hubs
- Azure Activity Log
- Azure Service Health

Explanation:
You would use the Azure Activity Log, not Access Control to view which user turned off a specific virtual machine during the last 14 days.
Activity logs are kept for 90 days. You can query for any range of dates, as long as the starting date isn't more than 90 days in the past.
In this question, we would create a filter to display shutdown operations on the virtual machine in the last 14 days.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-audit

Question: 220 CertyIQ

Which service provides network traffic filtering across multiple Azure subscriptions and virtual networks?

A. Azure Firewall
B. an application security group

Azure Firewall: A managed, cloud-based network security service that protects Azure Virtual Network resources. It features built-in high availability and unrestricted cloud scalability. Centrally deployed in a hub virtual network, it enforces layer 3 to layer 7 network and application traffic-filtering rules globally across multiple spoke virtual networks and across different Azure subscriptions.

C. Azure DDoS protection

D. a network security group (NSG)

a network security group (NSG): An NSG filters inbound and outbound traffic at layers 3 and 4 for resources inside a virtual network. An individual NSG cannot be associated across multiple virtual networks or subscriptions; it is strictly scoped to subnets or network interfaces within the single virtual network where it resides.

Answer: A

Explanation:

You can restrict traffic to multiple virtual networks in multiple subscriptions with a single Azure firewall.

Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.

You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

Reference:

https://docs.microsoft.com/en-us/azure/firewall/overview

Question: 221

CertyIQ

Which Azure service should you use to store certificates?

A. Azure Security Center

B. an Azure Storage account

C. Azure Key Vault

D. Azure Information Protection

Answer: C

Explanation:

Certificate Management - Azure Key Vault is also a service that lets you easily provision, manage, and deploy public and private Secure Sockets Layer/Transport Layer Security (SSL/TLS) certificates for use with Azure and your internal connected resources

Azure Key Vault is a secure store for storage various types of sensitive information including passwords and certificates.

Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.

Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are

Federal Information Processing Standards (FIPS) 140-2 Level 2 validated.

Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

References:

https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview

Question: 222 CertyIQ

Which Azure service can you use as a security information and event management (SIEM) solution?

A. Azure Analysis Services
B. Azure Sentinel
C. Azure Information Protection
D. Azure Cognitive Services

SIEM & SOAR Capabilities: Microsoft Sentinel (formerly Azure Sentinel) is a scalable, cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automation, and Response (SOAR) solution.

It delivers intelligent security analytics and threat intelligence across an entire enterprise by collecting data at cloud scale across all users, devices, applications, and infrastructure (both on-premises and in multiple clouds), detecting undetected threats, investigating threats with artificial intelligence, and responding rapidly via built-in automation playbooks.

Answer: B

Explanation:

Microsoft Azure Sentinel is a scalable, cloud-native, security information event management (SIEM) and security orchestration automated response (SOAR) solution.

Reference:

https://azure.microsoft.com/en-in/services/azure-sentinel/

Question: 223 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 1 (No): Microsoft Sentinel (Azure Sentinel) runs directly on top of an Azure Log Analytics workspace, not a standard Azure Storage account. All ingested logs, tables, and security telemetry are stored and queried within the Log Analytics data store using KQL (Kusto Query Language).

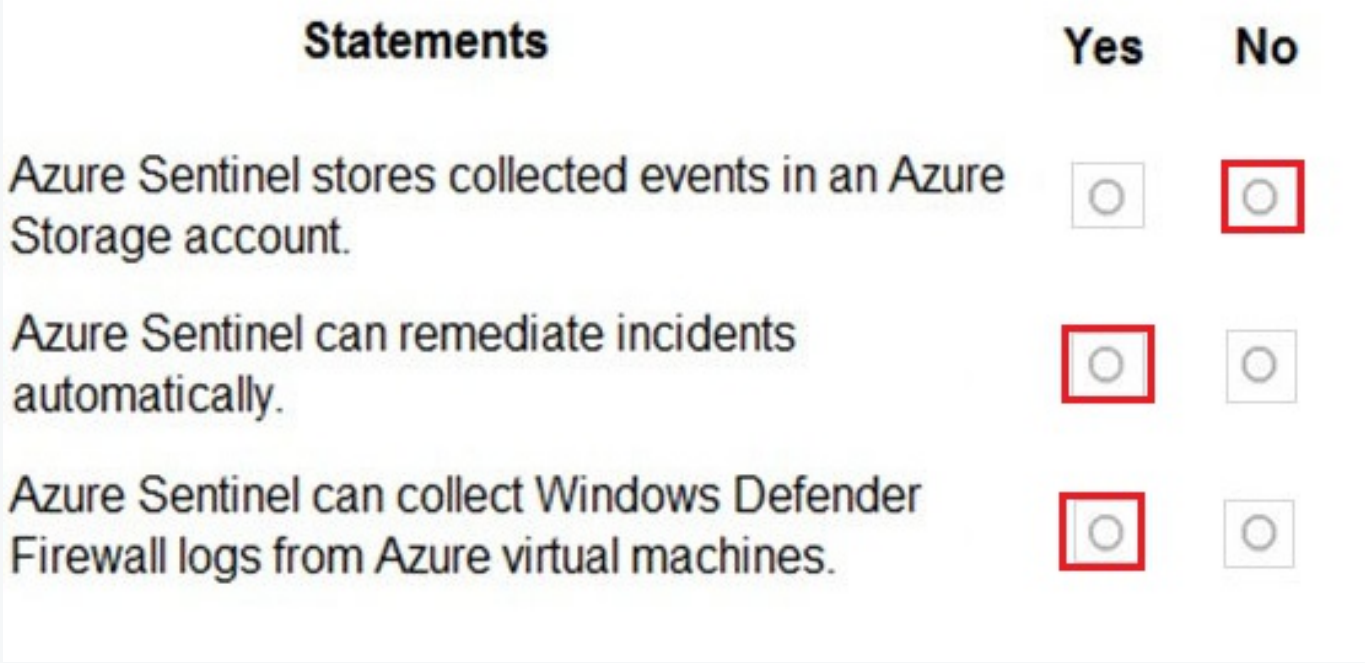
Statements	Yes	No
Azure Sentinel stores collected events in an Azure Storage account.	○	○
Azure Sentinel can remediate incidents automatically.	○	○
Azure Sentinel can collect Windows Defender Firewall logs from Azure virtual machines.	○	○

Answer:

Statement 2 (Yes): Microsoft Sentinel includes SOAR (Security Orchestration, Automation, and Response) capabilities. It uses automation rules and playbooks (powered by Azure Logic Apps) to trigger automated remediation actions (such as isolating a host, resetting a compromised user account, or modifying firewall rules) immediately when an incident or alert is generated.

Statement 3 (Yes): Sentinel collects host-level operating system logs—including Windows Defender Firewall logs—from Azure VMs using native data connectors via the Azure Monitor Agent (AMA) / Log Analytics data collection rules.

Answer Area



Explanation:

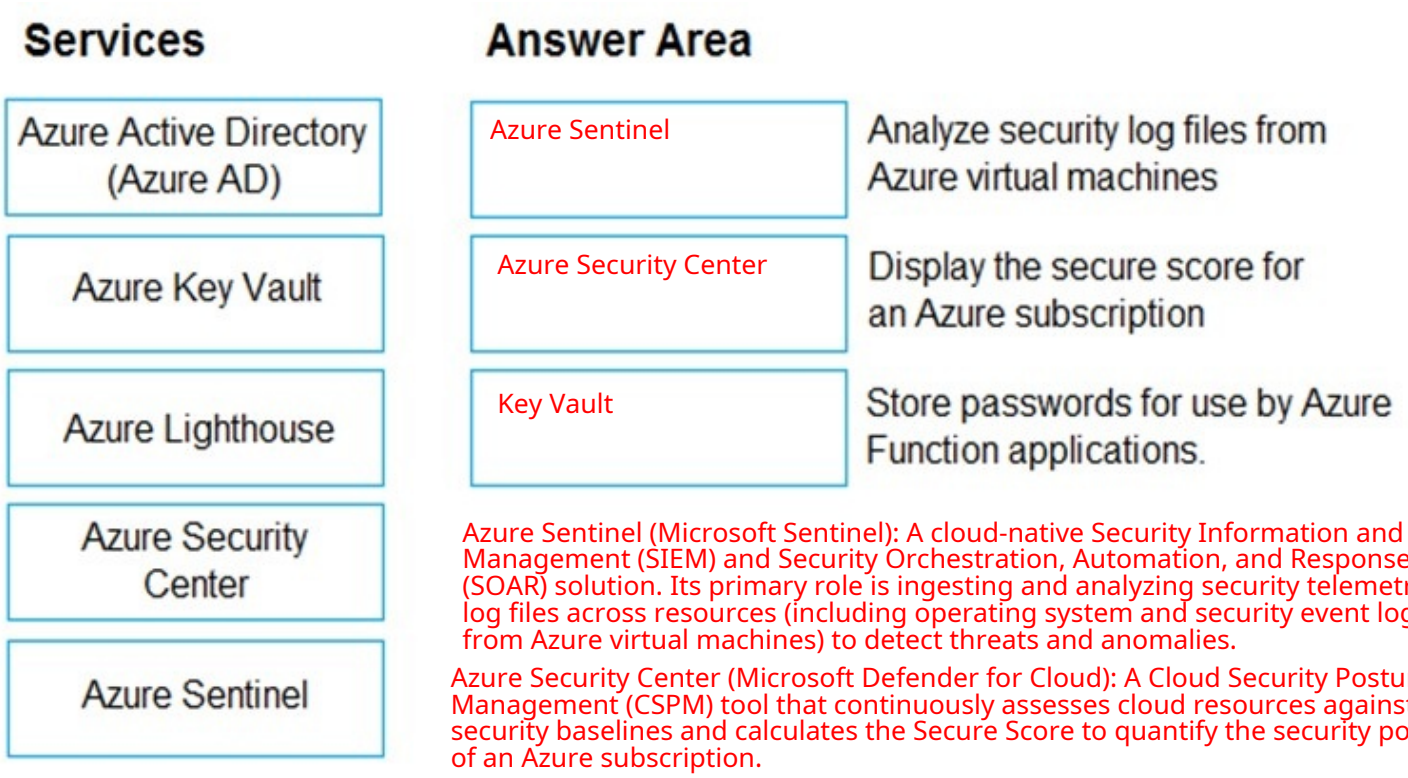
No. Azure Sentinel stores collected events in Azure Log Analytics workspaces, not in an Azure Storage account.

Yes. Azure Sentinel can remediate incidents automatically using Playbooks, which are collections of procedures that can be run from Azure Sentinel.

Yes. Azure Sentinel can collect Windows Defender firewall logs from Azure VMs.

Question: 224 CertyIQ

DRAG DROP -
Match the Azure Services service to the correct descriptions.
Instructions: To answer, drag the appropriate service from the column on the left to its description on the right.
Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Azure Sentinel (Microsoft Sentinel): A cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automation, and Response (SOAR) solution. Its primary role is ingesting and analyzing security telemetry and log files across resources (including operating system and security event logs from Azure virtual machines) to detect threats and anomalies.

Azure Security Center (Microsoft Defender for Cloud): A Cloud Security Posture Management (CSPM) tool that continuously assesses cloud resources against security baselines and calculates the Secure Score to quantify the security posture of an Azure subscription.

Answer:

1.Azure Sentinel, 2.Azure Security Center, 3.Azure Key Vault

Explanation:

Box 1: Azure Sentinel -

Box 2: Azure Security Center -

Box 3: Azure Key Vault -

➪ Azure Active Directory (Azure AD)

Azure AD is an identity and access management service, which helps your employees sign in and access resources

➪ Azure Lighthouse

Azure Lighthouse is used for cross- and multi-tenant management.

Reference:

https://docs.microsoft.com/en-us/azure/sentinel/overview

https://docs.microsoft.com/en-us/azure/security-center/secure-score-security-controls
https://practical365.com/securing-sensitive-information-in-azure-functions-with-the-azure-key-vault/
https://docs.microsoft.com/en-us/azure/active-directory/fundamentals/active-directory-whatis
https://docs.microsoft.com/en-us/azure/lighthouse/overview

Question: 225

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Hot Area:

Azure Firewall: A stateful network traffic filtering service (Layer 3 to Layer 7). It inspects and permits or blocks packets, but it does not encrypt outbound traffic sent to the public Internet.

Answer Area

Statements	Yes	No
Azure Firewall will encrypt all the network traffic sent from Azure to the Internet.	○	○
A network security group (NSG) will encrypt all the network traffic sent from Azure to the Internet.	○	○
Azure virtual machines that run Windows Server 2016 can encrypt network traffic sent to the Internet.	○	○

Network Security Group (NSG): A basic Layer 3/4 packet-filtering firewall rule set (Source, Destination, Port, Protocol). It enforces allow/deny security rules; it has no encryption capabilities whatsoever

Virtual Machines (Windows Server 2016): An operating system running inside a VM can establish encrypted sessions (such as TLS/HTTPS, SSH, IPsec, or VPN client connections) directly from the OS/application layer out to internet endpoints

Answer:

Answer Area

Statements	Yes	No
Azure Firewall will encrypt all the network traffic sent from Azure to the Internet.	○	○
A network security group (NSG) will encrypt all the network traffic sent from Azure to the Internet.	○	○
Azure virtual machines that run Windows Server 2016 can encrypt network traffic sent to the Internet.	○	○

Explanation:

Box 1: No -

Azure firewall does not encrypt network traffic. It is used to block or allow traffic based on source/destination IP address, source/destination ports and protocol.

Box 2: No -

A network security group does not encrypt network traffic. It works in a similar way to a firewall in that it is used to block or allow traffic based on source/ destination IP address, source/destination ports and protocol.

Box 3: No -

The question is rather vague as it would depend on the configuration of the host on the Internet. Windows Server does come with a VPN client and it also supports other encryption methods such IPSec encryption or SSL/TLS so it could encrypt the traffic if the Internet host was configured to require or accept the encryption.

However, the VM could not encrypt the traffic to an Internet host that is not configured to require the encryption.

Reference:

https://docs.microsoft.com/en-us/azure/security/azure-security-data-encryption-best-practices#protect-data-in-transit

Question: 226 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Hybrid Monitoring: Azure Security Center (now Microsoft Defender for Cloud) provides hybrid cloud security posture management. By deploying the Log Analytics / Azure Monitor Agent or connecting via Azure Arc, it assesses and monitors both native Azure workloads and on-premises physical/virtual machines.

Answer Area

Statements	Yes	No
Azure Security Center can monitor Azure resources and on-premises resources.	○	○
All Azure Security Center features are free.	○	○
From Azure Security Center, you can download a Regulatory Compliance report.	○	○

Answer:

Regulatory Compliance Dashboard: The platform includes an integrated Regulatory Compliance dashboard mapping security controls against international standards (e.g., ISO 27001, SOC 2, PCI-DSS, CIS). From this dashboard, administrators can generate and download executive summary reports and detailed compliance assessments.

Answer Area

Statements	Yes	No
Azure Security Center can monitor Azure resources and on-premises resources.	○	○
All Azure Security Center features are free.	○	○
From Azure Security Center, you can download a Regulatory Compliance report.	○	○

Explanation:

Box 1: Yes -

Azure Security Center is a unified infrastructure security management system that strengthens the security posture of your data centers, and provides advanced threat protection across your hybrid workloads in the cloud - whether they're in Azure or not - as well as on premises.

Box 2: No -

Only two features: Continuous assessment and security recommendations, and Azure secure score, are free.

Box 3: Yes -

The advanced monitoring capabilities in Security Center also let you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

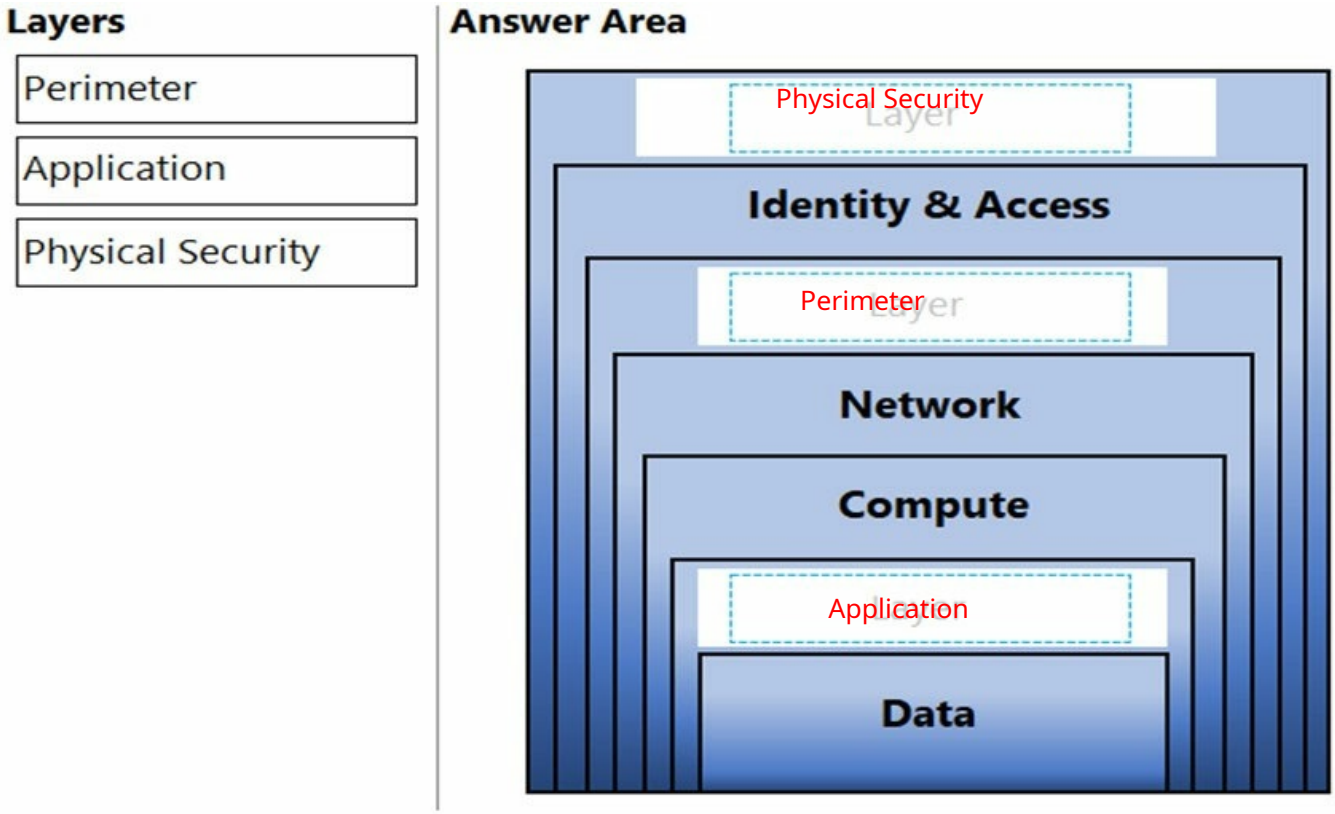
Note:- Azure Security Center and Azure Defender are now called Microsoft Defender for Cloud.

References:

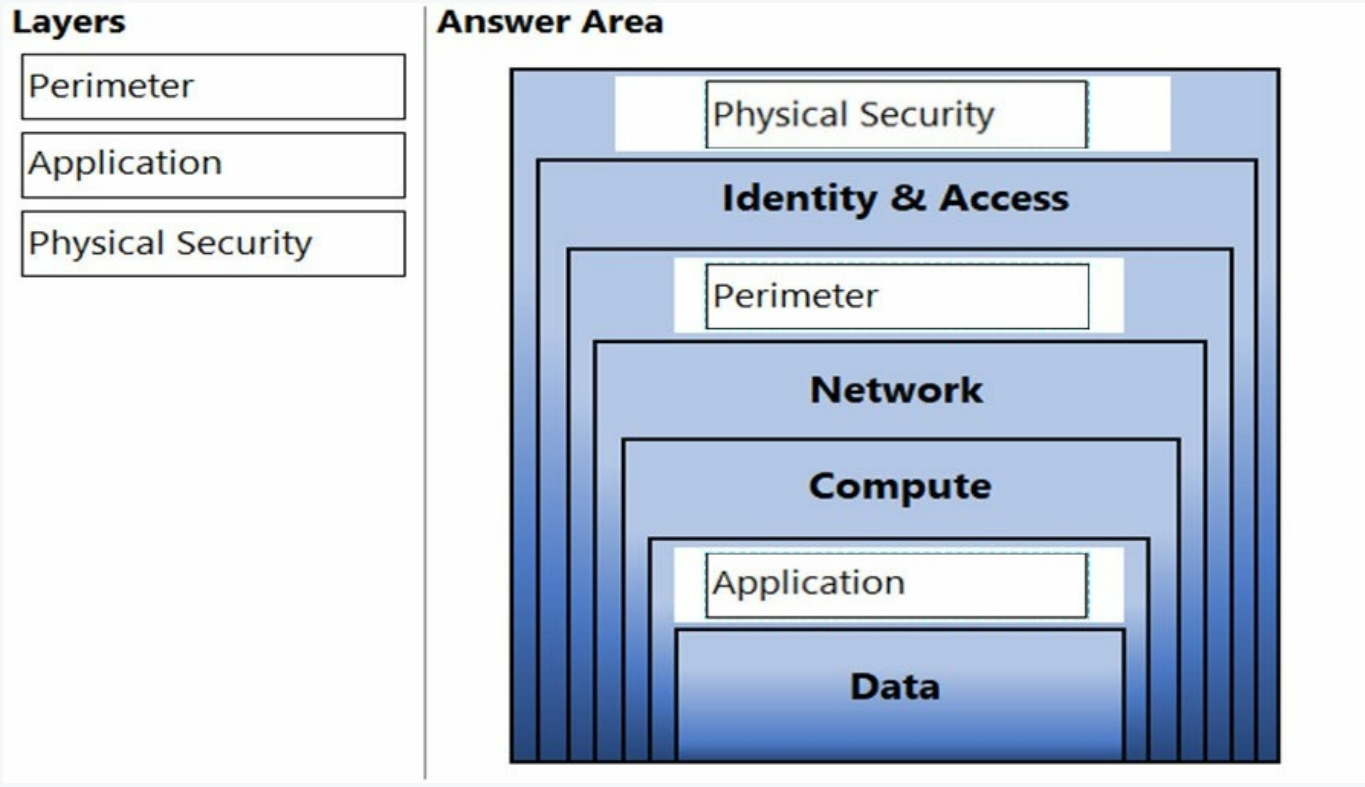
https://docs.microsoft.com/en-us/azure/security-center/security-center-intro

Question: 227 CertyIQ

DRAG DROP -
You need to complete the defense-in-depth strategy used in a datacenter.
What should you do? To answer, drag the appropriate layers to the correct positions in the model. Each layer may be used once, more than once, or not at all.
You may need to drag the split bar between panes or scroll to view content.
NOTE: Each correct selection is worth one point.
Select and Place:



Answer:



Explanation:

Physical Security (Top)

Identity & Access

Perimeter

Network

Compute

Application

Data (Bottom)

Defence in depth layers (from bottom to top):

✑ Data

- In almost all cases attackers are after data.

- Data can be in database, stored on disk inside VMs, on a SaaS application such as Office 365 or in cloud storage.

- Those storing and controlling access to data to ensures that it's properly secured

- Often regulatory requirements dictates controls & processes

- to ensure confidentiality, integrity, and availability.

✑ Application

- Ensure applications are secure and free of vulnerabilities.

- Store sensitive application secrets in a secure storage medium.

- Make security a design requirement for all application development.

- Integrate security into the application development life cycle.

✑ Compute

- Secure access to virtual machines.

- Implement endpoint protection and keep systems patched and current.

- Malware, unpatched systems, and improperly secured systems open your environment to attacks.

✑ Networking

- Limit communication between resources.

- Deny by default.

- Allow only what is required

- Restrict inbound internet access and limit outbound, where appropriate.

- Implement secure connectivity to on-premises networks.

✑ Perimeter

- Use distributed denial of service (DDoS) protection to filter large-scale attacks before they can cause a denial of service for end users.

- Use perimeter firewalls to identify and alert on malicious attacks against your network.

✑ Identity and access

- Control access to infrastructure and change control.

- Access granted is only what is needed

- Use single sign-on and multi-factor authentication.

- Audit events and changes.

✑ Physical security

- Building security & controlling access to computing hardware.

- First line of defense.

https://github.com/undergroundwires/Azure-in-bullet-points/blob/master/AZ-900%20Microsoft%20Azure%20Fundamentals/4.2.%20Defence%20in%20Depth.md

Question: 228 CertyIQ

You have an Azure virtual machine named VM1.
You plan to encrypt VM1 by using Azure Disk Encryption.
Which Azure resource must you create first?

Prerequisites for Azure Disk Encryption (ADE): Azure Disk Encryption relies on OS-level encryption tools—BitLocker for Windows VMs and DM-Crypt for Linux VMs—to protect OS and data disks.

A. an Azure Storage account
B. an Azure Key Vault
C. an Azure Information Protection policy
D. an Encryption key

To safeguard and control the cryptographic keys and secrets that BitLocker/DM-Crypt generate, ADE integrates directly with Azure Key Vault.

Before enabling Azure Disk Encryption on any virtual machine, you must create or have an existing Azure Key Vault enabled with the appropriate access policies/permissions for disk encryption (--enabled-for-disk-encryption in Azure CLI or PowerShell). You cannot generate or store an encryption key without having the container resource—the Key Vault—created first.

Answer: B

Explanation:
Azure Disk Encryption requires an Azure Key Vault to control and manage disk encryption keys and secrets.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/disk-encryption-overview

Question: 229 CertyIQ

Which resources can be used as a source for a Network security group inbound security rule?

A. Service Tags only
B. IP Addresses, Service tags and Application security groups
C. Application security groups only
D. IP Addresses only

Network Security Group (NSG) Rule Schema: When defining an inbound or outbound security rule in an NSG, Azure requires specifying a Source and a Destination.

Azure Supports three source types
+ IP Address: Individual IPv4/IPv6 addresses or classess CIDR ranges
+ Service Tags: A predefined group IP address prefixes managed directly by Microsoft representing specific services:
+ Application Security Groups (ASGs): A logical grouping of virtual machine network interfaces (NICs) allowing you to define network security policies based on application structure.

Answer: B

Explanation:

Source or destination:

Any, or an individual IP address, classless inter-domain routing (CIDR) block (10.0.0.0/24, for example), service tag, or application security group.

Network security groups are processed after Azure translates a public IP address to a private IP address for inbound traffic, and before Azure translates a private IP address to a public IP address for outbound traffic. .

Specifying a range, a service tag, or application security group, enables you to create fewer security rules.

https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview#security-rules

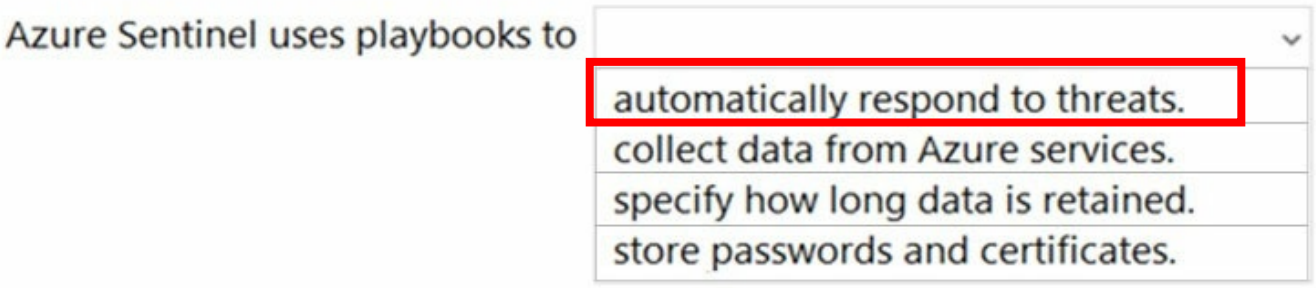
Reference:

https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview

Question: 230 CertyIQ

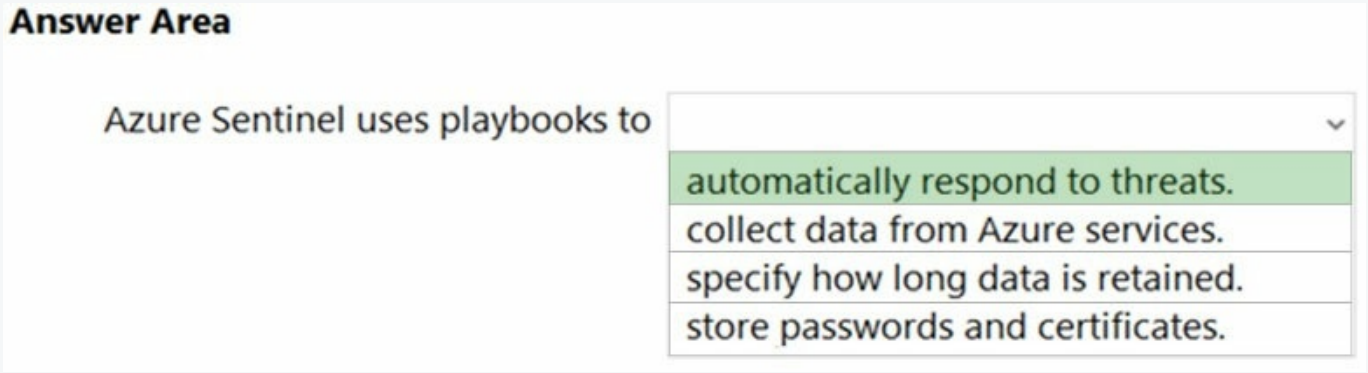
HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

Playbooks are collections of procedures that can be run from Azure Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively. It can also be run manually on-demand.

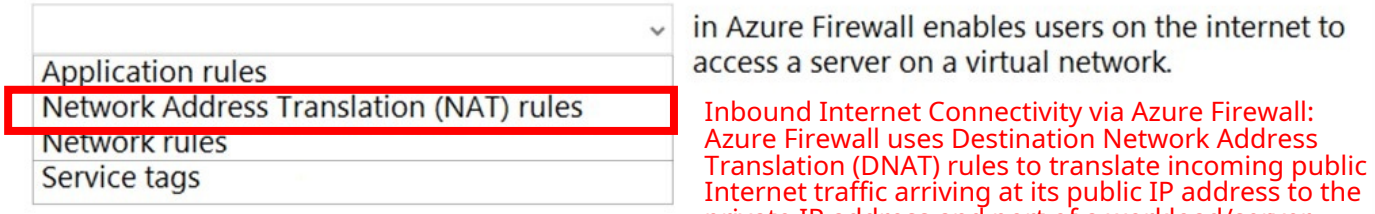
Reference:

https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook

Question: 231 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Inbound Internet Connectivity via Azure Firewall: Azure Firewall uses Destination Network Address Translation (DNAT) rules to translate incoming public Internet traffic arriving at its public IP address to the private IP address and port of a workload/server inside a Virtual Network (VNet).

Answer:

When a NAT rule is configured, Azure Firewall implicitly generates a corresponding network rule to permit the translated traffic through, enabling external Internet clients to access internal virtual network servers without exposing the internal server's private IP directly to the Internet.

Answer Area

Explanation:

If you configure network rules and application rules, then network rules are applied in priority order before application rules.

NAT rules are applied in priority before network rules.

https://docs.microsoft.com/en-us/azure/firewall/rule-processing

Reference:

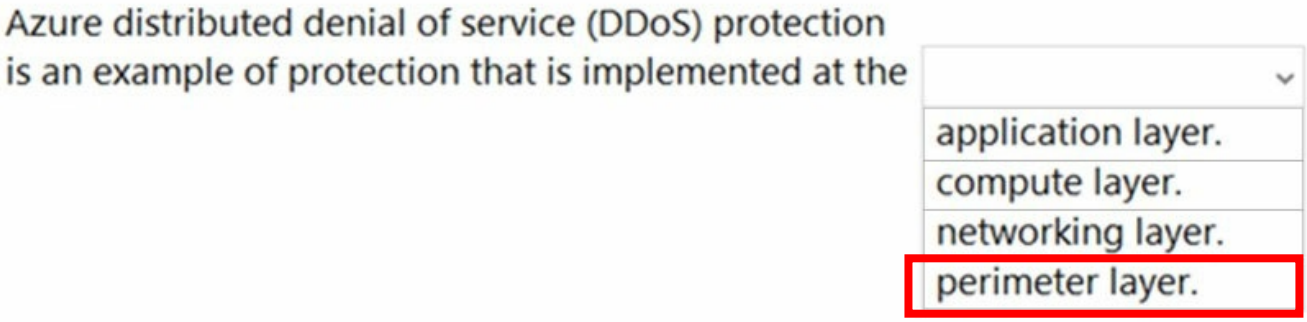
https://docs.microsoft.com/en-us/azure/firewall/tutorial-firewall-dnat-policy

Question: 232

CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Defense in Depth Framework: In Microsoft's Defense in Depth layered security model, the perimeter layer protects an organization's network boundaries against large-scale external network attacks before they reach internal cloud infrastructure

Answer Area

Azure distributed denial of service (DDoS) protection is an example of protection that is implemented at the

- application layer.
- compute layer.
- networking layer.
- perimeter layer.

Explanation:

"The perimeter layer uses distributed denial of service (DDoS) protection to filter large-scale attacks before they can cause a denial of service for users."

https://docs.microsoft.com/en-us/learn/modules/secure-network-connectivity-azure/2-what-is-defense-in-depth

Question: 233 CertyIQ

You have an Azure Sentinel workspace.
You need to automate responses to threats detected by Azure Sentinel.
What should you use?

A. adaptive network hardening in Azure Security Center
B. Azure Service Health
C. Azure Monitor workbooks
D. adaptive application controls in Azure Security Center

Playbooks and Automation Rules

Built using Azure Logic Apps

Threat Automation in Microsoft Sentinel: To automate and orchestrate responses to threats detected by Sentinel, you use Playbooks (built on the foundation of Azure Logic Apps) and Automation Rules. A playbook contains a collection of automated remediation actions (such as blocking an IP address, revoking user sessions, or opening a ServiceNow ticket) that execute automatically when an incident or alert triggers.

Answer: C

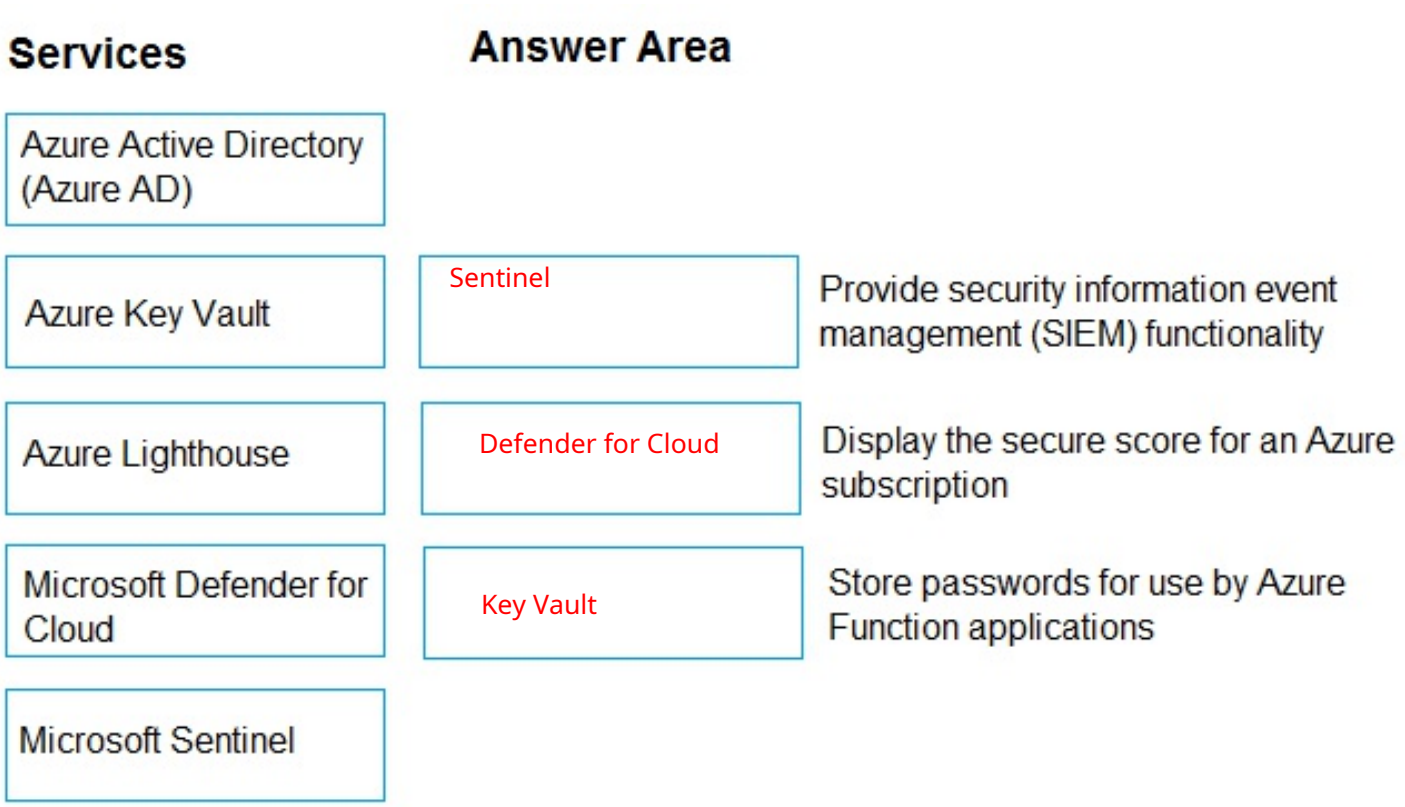
Explanation:

Once you have connected your data sources to Microsoft Sentinel, you can visualize and monitor the data using the Microsoft Sentinel adoption of Azure Monitor Workbooks, which provides versatility in creating custom dashboards. While the Workbooks are displayed differently in Microsoft Sentinel, it may be useful for you to see how to create interactive reports with Azure Monitor Workbooks. Microsoft Sentinel allows you to create custom workbooks across your data, and also comes with built-in workbook templates to allow you to quickly gain insights across your data as soon as you connect a data source.

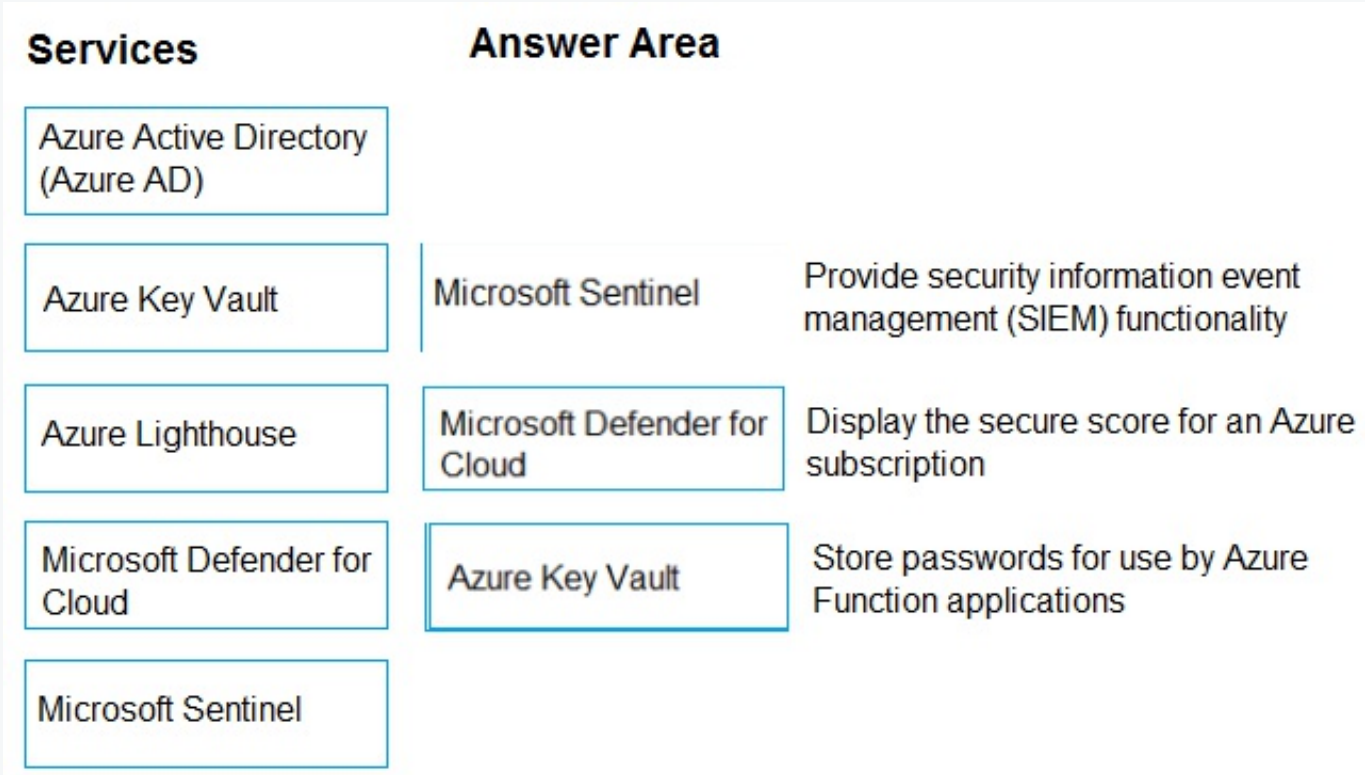
https://docs.microsoft.com/en-us/azure/sentinel/monitor-your-data

Question: 234 CertyIQ

DRAG DROP -
Match the Azure services benefits to the correct descriptions.
Instructions: To answer, drag the appropriate benefit from the column on the left to its description on the right.
Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:



Explanation:

Box 1: Microsoft Sentinel -

Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution. Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Box 2: Microsoft Defender for Cloud

You can find your overall secure score, as well as your score per subscription, through the Azure portal. Defender for Cloud displays your secure score prominently in the portal.

Box 3: Azure Key Vault -
A favored approach to store the credentials or keys in the Azure Key Vault as secrets and reference the secrets as environment variables in our Azure functions apps.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/overview
https://docs.microsoft.com/en-us/azure/defender-for-cloud/secure-score-access-and-track
https://levelup.gitconnected.com/a-secure-way-to-use-credentials-and-secrets-in-azure-functions-7ec91813c807

Question: 235 CertyIQ

Which Azure service can you use as a security information and event management (SIEM) solution?

A. Azure Analysis Services
B. Microsoft Sentinel
C. Azure Information Protection
D. Azure Cognitive Services

Answer: B

Explanation:
Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution. Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/overview

Question: 236 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Azure Policy initiative definition is a [collection of policy definitions. | collection of Azure Policy definition assignments. | group of Azure Blueprints definitions. | group of role-based access control (RBAC) role assignments.]

Answer: Azure Policy Initiatives: An initiative definition (also called a policy set) is an Azure governance construct that groups multiple individual policy definitions together into a single logical unit.

Grouping policies into an initiative simplifies managing and tracking compliance toward a single overarching goal (such as regulatory compliance standards like ISO 27001 or cost governance) across subscriptions, resource groups, or management groups through a single assignment.

Answer Area

An Azure Policy initiative definition is a [collection of policy definitions. | collection of Azure Policy definition assignments. | group of Azure Blueprints definitions. | group of role-based access control (RBAC) role assignments.]

Explanation:

Box: collection of policy definitions

An Azure Policy initiative is a collection of Azure Policy definitions, or rules, that are grouped together towards a specific goal or purpose. Azure initiatives simplify management of your policies by grouping a set of policies together, logically, as a single item.

"collect of policy definitions" is the answer.

https://learn.microsoft.com/en-us/azure/governance/policy/overview#initiative-definition

An initiative definition is a collection of policy definitions that are tailored toward achieving a singular overarching goal. Initiative definitions simplify managing and assigning policy definitions. They simplify by grouping a set of policies as one single item. For example, you could create an initiative titled Enable Monitoring in Microsoft Defender for Cloud, with a goal to monitor all the available security recommendations in your Microsoft Defender for Cloud instance.

Reference:

https://docs.microsoft.com/en-us/azure/defender-for-cloud/security-policy-concept

Question: 237

CertyIQ

You have an Azure subscription.
You need to review your secure score.
What should you use?

A. Azure Monitor
B. Azure Advisor
C. Help + support
D. Microsoft Defender for Cloud

Answer: D

Explanation:

The central feature in Defender for Cloud that enables you to achieve those goals is secure score.

Microsoft Defender for Cloud has two main goals:

- to help you understand your current security situation

- to help you efficiently and effectively improve your security

The central feature in Defender for Cloud that enables you to achieve those goals is the secure score.

Defender for Cloud continually assesses your cross-cloud resources for security issues. It then aggregates all the findings into a single score so that you can tell, at a glance, your current security situation: the higher the score, the lower the identified risk level.

Reference:

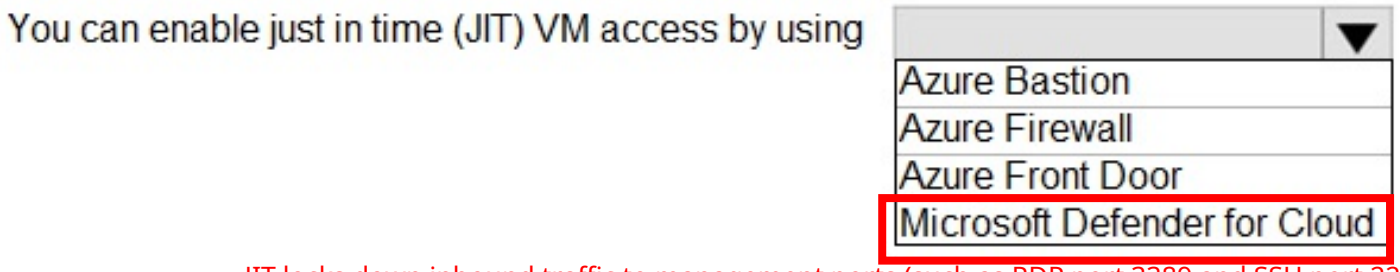
https://docs.microsoft.com/en-us/azure/defender-for-cloud/secure-score-security-controls

Question: 238 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Just-in-Time (JIT) VM Access: A security feature provided under Microsoft Defender for Cloud (specifically part of the Defender for Servers plan, formerly Azure Security Center standard tier).



JIT locks down inbound traffic to management ports (such as RDP port 3389 and SSH port 22) by modifying Network Security Group (NSG) and Azure Firewall rules to deny inbound access by default. When an authorized user requests access, Defender for Cloud temporarily enables an inbound rule for that user's IP address for a specific, time-limited window before automatically closing it again.

Answer:

Answer Area

Explanation:
Box: Microsoft Defender for Cloud
Lock down inbound traffic to your Azure Virtual Machines with Microsoft Defender for Cloud's just-in-time (JIT) virtual machine (VM) access feature. This reduces exposure to attacks while providing easy access when you need to connect to a VM.

Reference:
https://docs.microsoft.com/en-us/azure/defender-for-cloud/just-in-time-access-usage

Question: 239 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Microsoft Defender for Cloud

Answer:

Regulatory Compliance Dashboard: Microsoft Defender for Cloud (formerly Azure Security Center) includes a dedicated Regulatory Compliance dashboard.

This dashboard maps your deployed cloud resources against specific industry standards and regulatory compliance frameworks (such as ISO 27001, SOC 2, HIPAA, PCI-DSS, and CIS benchmarks).

From this dashboard, organizations can review their compliance state, remediate failed controls, and directly generate/download downloadable compliance summary reports reflecting their tenant's specific cloud security posture.

Answer Area

You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Microsoft Defender for Cloud

Explanation:

Box: Microsoft Defender for Cloud

Microsoft Defender for Cloud helps streamline the process for meeting regulatory compliance requirements, using the regulatory compliance dashboard.

You can download PDF/CSV reports as well as certification reports of your compliance status.

Reference:

https://docs.microsoft.com/en-us/azure/defender-for-cloud/regulatory-compliance-dashboard

Question: 240 CertyIQ

You need to collect and automatically analyze security events from Azure Active Directory (Azure AD).
What should you use?

A. Microsoft Sentinel
B. Azure Synapse Analytics
C. Azure AD Connect
D. Azure Key Vault

SIEM & Identity Telemetry Analysis: Microsoft Sentinel is Microsoft's cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automation, and Response (SOAR) platform. Microsoft Sentinel provides native, out-of-the-box data connectors for Azure Active Directory (Microsoft Entra ID) to ingest sign-in logs, audit logs, and identity protection events.Once collected, Sentinel uses built-in machine learning, user and entity behavior analytics (UEBA), and correlation analytics rules to automatically detect and analyze threats across your identity estate.

Answer: A

Explanation:

Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution.

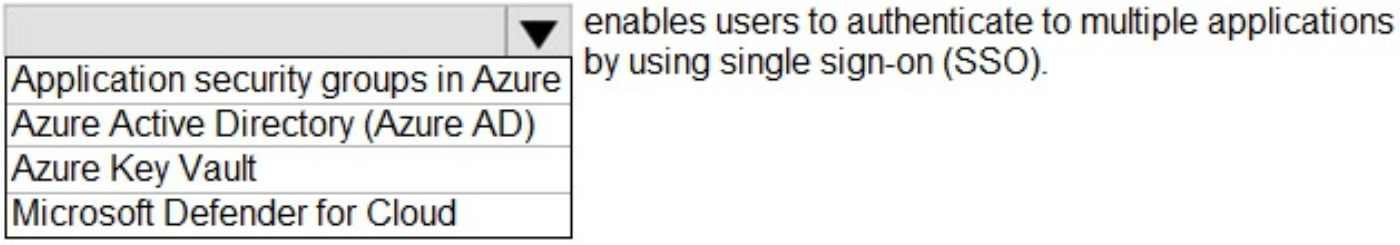
Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/overview

Question: 241 CertyIQ

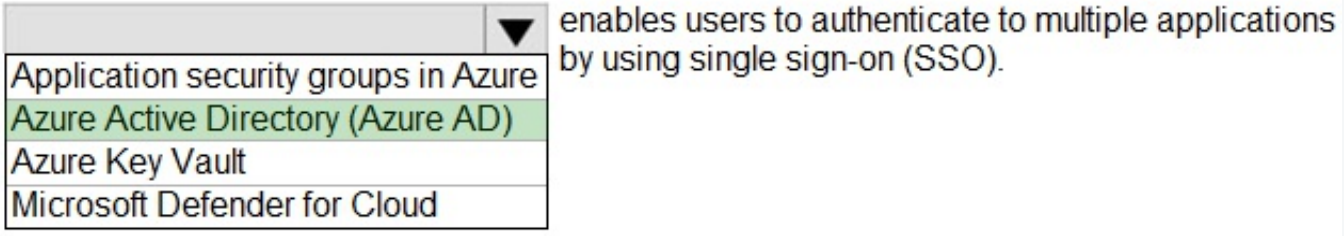
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:
Box: Azure Active Directory (Azure AD)
You can enable single sign-on for an enterprise application through Azure Active Directory (Azure AD.
Incorrect:
Application security groups enable you to configure network security as a natural extension of an application's structure, allowing you to group virtual machines and define network security policies based on those groups.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/manage-apps/add-application-portal-setup-sso

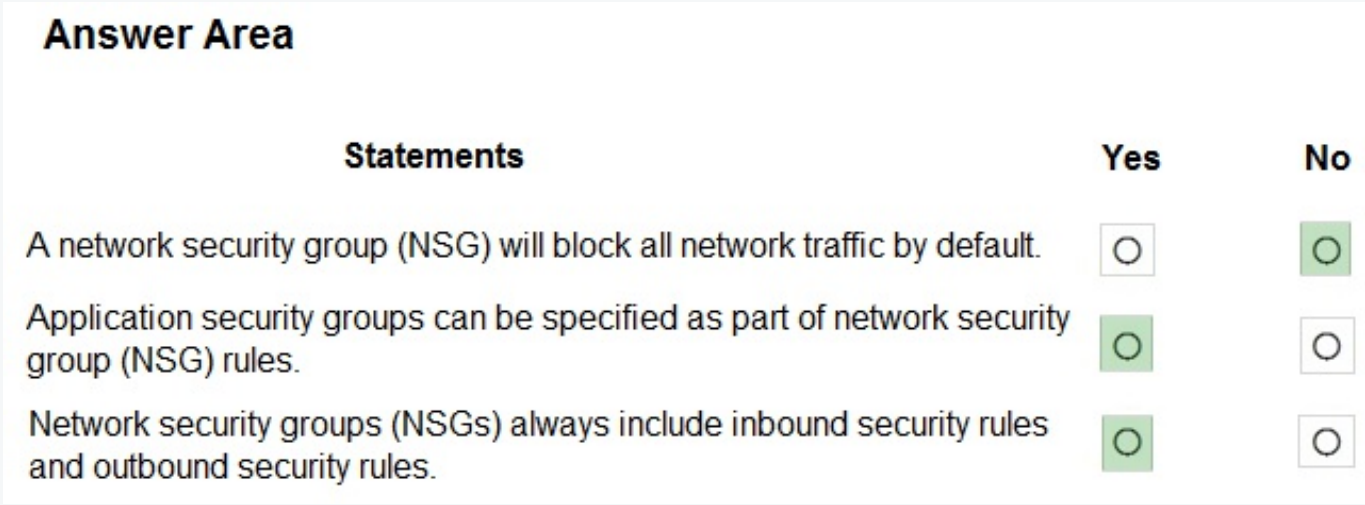
Question: 242 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A network security group (NSG) will block all network traffic by default.	○	○
Application security groups can be specified as part of network security group (NSG) rules.	○	○
Network security groups (NSGs) always include inbound security rules and outbound security rules.	○	○

Answer:



Explanation:

Box 1: No -
Azure creates the default rules in each network security group that you create. These rules allow some traffic.

Box 2: Yes -
A network security group contains zero, or as many rules as desired. These rules can refer to application security groups.

Box 3: Yes -
Azure creates the Inbound and OutBound default rules in each network security group that you create.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview

Question: 243 CertyIQ

DRAG DROP -
Match the term to the appropriate description.
To answer, drag the appropriate term from the column on the left to its description on the right. Each term may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Terms	Answer Area	
authorization		The ability to use the same credentials to access multiple resources and applications from different providers.
multi-factor authentication (MFA)		The process of identifying the access level of a user or service.
single sign-on (SSO)		Requires several elements to identify a user or a service.

Answer:

Terms	Answer Area	
authorization	single sign-on (SSO)	The ability to use the same credentials to access multiple resources and applications from different providers.
multi-factor authentication (MFA)	authorization	The process of identifying the access level of a user or service.
single sign-on (SSO)	multi-factor authentication (MFA)	Requires several elements to identify a user or a service.

Explanation:

Single sign-on (SSO) >> The ability to use the same credentials to access multiple resources and applications from different providers

Authentication >> The process of identifying the access level of a user or service

Multi-factor authentication(MFA) - Requires several elements to identify a user or a service

Question: 244 CertyIQ

Your company plans to automate the deployment of servers to Azure.
Your manager is concerned that you may expose administrative credentials during the deployment.
You need to recommend an Azure solution that encrypts the administrative credentials during the deployment.
What should you include in the recommendation?

A. Azure Key Vault
B. Azure Information Protection
C. Microsoft Defender for Cloud
D. Azure Multi-Factor Authentication (MFA)

Answer: A

Explanation:
Azure Key Vault protects cryptographic keys, certificates (and the private keys associated with the certificates), and secrets (such as connection strings and passwords) in the cloud.

Reference:
https://docs.microsoft.com/en-us/azure/key-vault/general/security-features

Question: 245 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

After you create a virtual machine, you need to modify the _____ to allow connections to TCP port 8080 on the virtual machine

- network security group (NSG)
- virtual network gateway
- virtual network
- route table

Answer:

Answer Area

After you create a virtual machine, you need to modify the _____ to allow connections to TCP port 8080 on the virtual machine

- network security group (NSG)
- virtual network gateway
- virtual network
- route table

Explanation:
Box: network Security group (NSG)
You can use an Azure network security group to filter network traffic to and from Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. For each rule, you can specify source and destination, port, and protocol.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview

Question: 246 CertyIQ

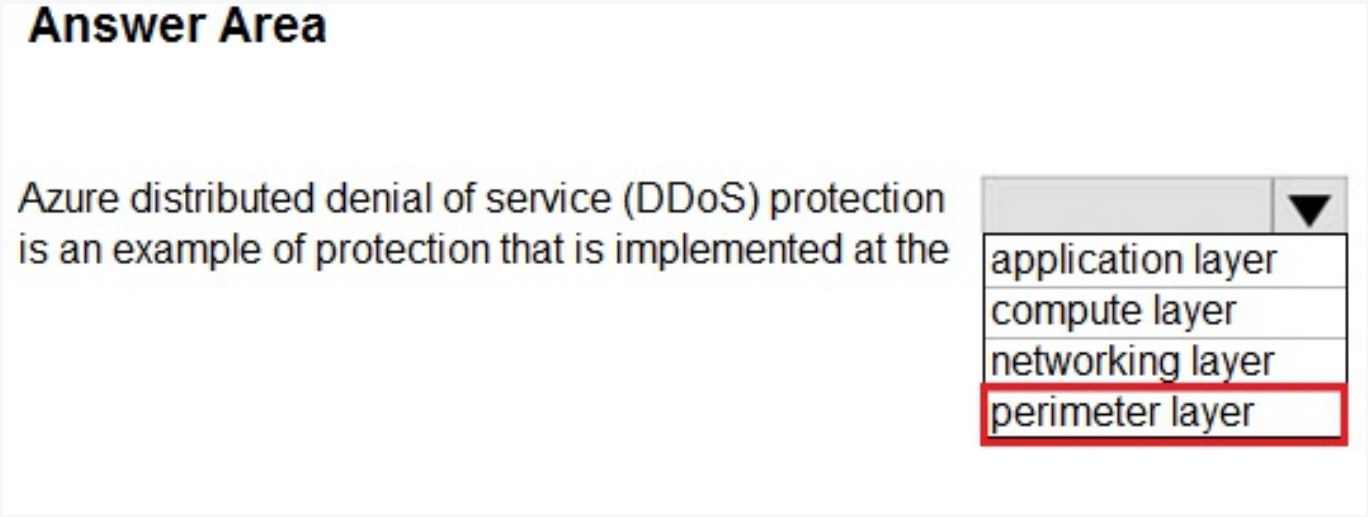
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure distributed denial of service (DDoS) protection is an example of protection that is implemented at the

- application layer
- compute layer
- networking layer
- perimeter layer

Answer:



Explanation:

Perimeter layer.

https://learn.microsoft.com/en-us/training/modules/secure-network-connectivity-azure/2-what-is-defense-in-depth

Question: 247

CertyIQ

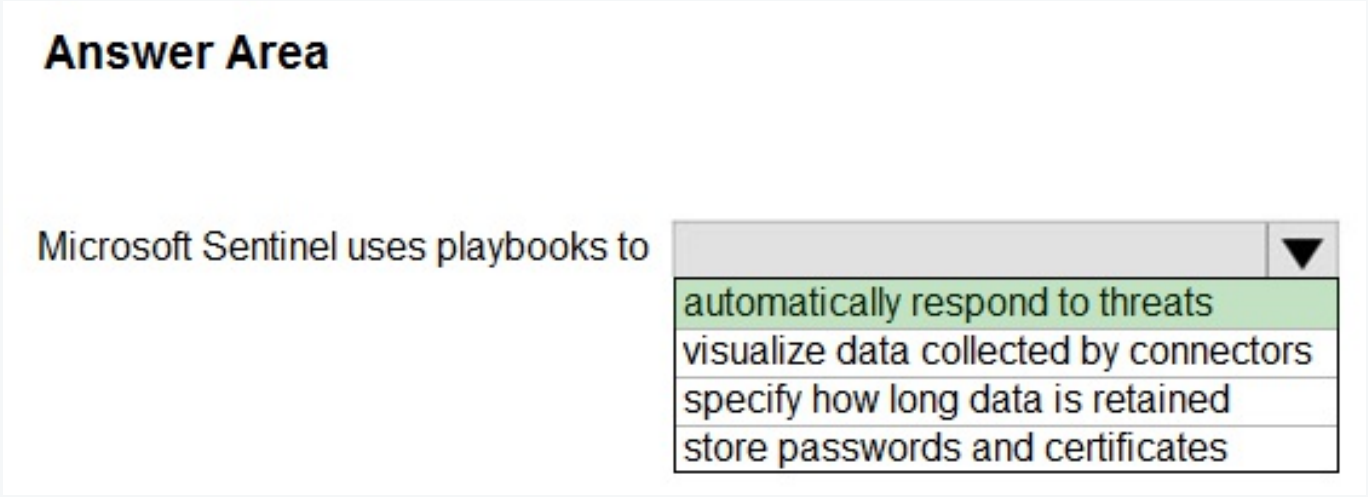
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Microsoft Sentinel uses playbooks to

- automatically respond to threats
- visualize data collected by connectors
- specify how long data is retained
- store passwords and certificates

Answer:



Explanation:
Box: automatically respond to threats
Playbooks are collections of procedures that can be run from Microsoft Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively.
Note: Automation rules help you triage incidents in Microsoft Sentinel. You can use them to automatically assign incidents to the right personnel, close noisy incidents or known false positives, change their severity, and add tags. They are also the mechanism by which you can run playbooks in response to incidents.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook

Question: 248 CertyIQ

You need to configure an Azure solution that meets the following requirements:
- Secures websites from attacks
- Generates reports that contain details of attempted attacks

What should you include in the solution?

A. Azure Firewall
B. a network security group (NSG)
C. Azure Information Protection
D. DDoS protection

Answer: D

Explanation:

Attack is the Key word for DDOS.

Rules is keyword for Firewall.

Allow/Deny is the Keyword for NSG

DDoS is a type of attack that tries to exhaust application resources. The goal is to affect the application's availability and its ability to handle legitimate requests.

DDoS attacks can be targeted at any endpoint that is publicly reachable through the internet.

Azure has two DDoS service offerings that provide protection from network attacks: DDoS Protection Basic and DDoS Protection Standard.

DDoS Basic protection is integrated into the Azure platform by default and at no extra cost.

You have the option of paying for DDoS Standard. It has several advantages over the basic service, including logging, alerting, and telemetry. DDoS Standard can generate reports that contain details of attempted attacks as required in this question.

Reference:

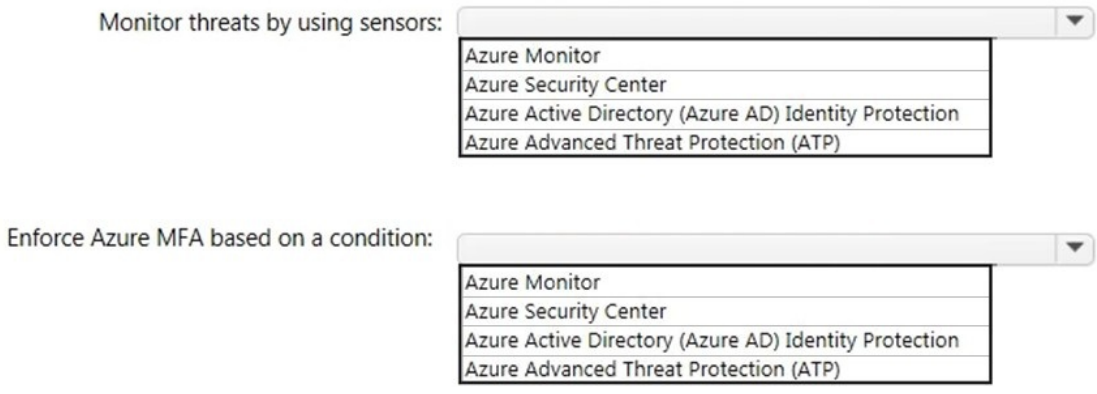
https://docs.microsoft.com/en-us/azure/security/fundamentals/ddos-best-practices

Question: 249 CertyIQ

HOTSPOT -
You plan to implement several security services for an Azure environment. You need to identify which Azure services must be used to meet the following security requirements:
- Monitor threats by using sensors
- Enforce Azure Multi-Factor Authentication (MFA) based on a condition

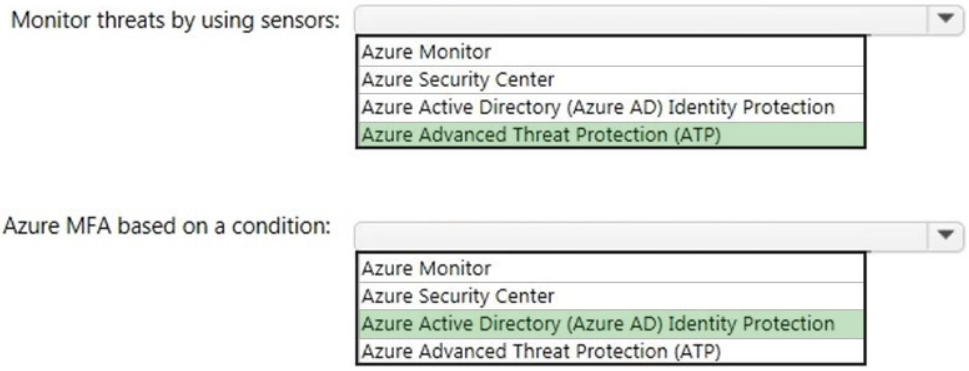
Which Azure service should you identify for each requirement? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:
Box 1:
To monitor threats by using sensors, you would use Azure Advanced Threat Protection (ATP).
Azure Advanced Threat Protection (ATP) is a cloud-based security solution that leverages your on-premises Active Directory signals to identify, detect, and investigate advanced threats, compromised identities, and malicious insider actions directed at your organization.
Sensors are software packages you install on your servers to upload information to Azure ATP.
Box 2:
To enforce MFA based on a condition, you would use Azure Active Directory Identity Protection.
Azure AD Identity Protection helps you manage the roll-out of Azure Multi-Factor Authentication (MFA) registration by configuring a Conditional Access policy to require MFA registration no matter what modern authentication app you are signing in to.

Reference:
https://docs.microsoft.com/en-us/azure-advanced-threat-protection/what-is-atp
https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-identity-protection-configure-mfa-policy

Question: 250

CertyIQ

Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
What are two possible solutions? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Modify an Azure Traffic Manager profile
B. Modify a network security group (NSG)
C. Modify a DDoS protection plan
D. Modify an Azure firewall

Answer: BD

Explanation:

Question saying there should be 2 answer, not just one as given in the solution.

B (NSG) and D (Firewall)

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

Reference:

https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 251 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer:

Explanation:

"Azure Security Center" is the answer, and it has been renamed to **Microsoft Defender for Cloud.**

https://learn.microsoft.com/en-us/azure/defender-for-cloud/just-in-time-access-usage

You can use Microsoft Defender for Cloud's just-in-time (JIT) access to protect your Azure virtual machines (VMs) from unauthorized network access. Many times firewalls contain allow rules that leave your VMs

vulnerable to attack. JIT lets you allow access to your VMs only when the access is needed, on the ports needed, and for the period of time needed.

Reference:

https://docs.microsoft.com/en-us/azure/security-center/security-center-just-in-time?tabs=jit-config-asc%2Cjit-request-asc

Question: 252 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can associate a network security group (NSG) to a virtual network subnet.	○	○
You can associate a network security group (NSG) to a virtual network.	○	○
You can associate a network security group (NSG) to a network interface.	○	○

Answer:

Answer Area

Statements	Yes	No
You can associate a network security group (NSG) to a virtual network subnet.	●	○
You can associate a network security group (NSG) to a virtual network.	○	●
You can associate a network security group (NSG) to a network interface.	●	○

Explanation:

Box 1 - Yes

Box 2 - No

“You can associate zero, or one, network security group to each virtual network subnet and network interface

in a virtual machine. The same network security group can be associated to as many subnets and network interfaces as you choose."

References: https://docs.microsoft.com/en-us/azure/virtual-network/network-security-group-how-it-works

Note: It clearly says it must be either a subnet (not a virtual network) or a NIC.

Box 3 - Yes

Reference:

https://docs.microsoft.com/en-us/azure/virtual-network/network-security-group-how-it-works

Question: 253 CertyIQ

You have an Azure environment that contains 10 virtual networks and 100 virtual machines.
You need to limit the amount of inbound traffic to all the Azure virtual networks.
What should you create?

A. one application security group (ASG)
B. 10 virtual network gateways
C. 10 Azure ExpressRoute circuits
D. one Azure firewall

Answer: D

Explanation:
You can restrict traffic to multiple virtual networks with a single Azure firewall.
Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.
You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

Reference:
https://docs.microsoft.com/en-us/azure/firewall/overview

Question: 254 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
Azure Key Vault is used to store secrets for Azure Active Directory (Azure AD) user accounts.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Azure Active Directory (Azure AD) administrative accounts
C. Personally Identifiable Information (PII)
D. server applications

Answer: D

Explanation:

https://learn.microsoft.com/en-us/azure/key-vault/general/overview#why-use-azure-key-vault

Centralizing storage of application secrets in Azure Key Vault allows you to control their distribution. Key Vault greatly reduces the chances that secrets may be accidentally leaked. When application developers use Key Vault, they no longer need to store security information in their application. Not having to store security information in applications eliminates the need to make this information part of the code. For example, an application may need to connect to a database. Instead of storing the connection string in the app's code, you can store it securely in Key Vault.

Your applications can securely access the information they need by using URIs. These URIs allow the applications to retrieve specific versions of a secret. There's no need to write custom code to protect any of the secret information stored in Key Vault.

Reference:

https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/

Question: 255 CertyIQ

Your company plans to automate the deployment of servers to Azure.
Your manager is concerned that you may expose administrative credentials during the deployment.
You need to recommend an Azure solution that encrypts the administrative credentials during the deployment.
What should you include in the recommendation?

A. Azure Key Vault
B. Azure Information Protection
C. Azure Security Center
D. Azure Multi-Factor Authentication (MFA)

Answer: A

Explanation:
Azure Key Vault is a secure store for storage various types of sensitive information. In this question, we would store the administrative credentials in the Key Vault.
With this solution, there is no need to store the administrative credentials as plain text in the deployment scripts.
All information stored in the Key Vault is encrypted.
Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.
Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are
Federal Information Processing Standards (FIPS) 140-2 Level 2 validated.
Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

Reference:
https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview

Question: 256 CertyIQ

You plan to deploy several Azure virtual machines.
You need to control the ports that devices on the Internet can use to access the virtual machines.
What should you use?

A. a network security group (NSG)
B. an Azure Active Directory (Azure AD) role
C. an Azure Active Directory group
D. an Azure key vault

Answer: A

Explanation:
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 257 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

After you create a virtual machine, you need to modify the [▼] to allow connections to TCP port 8080 on the virtual machine.

- network security group (NSG)
- virtual network gateway
- virtual network
- route table

Answer:

Answer Area

After you create a virtual machine, you need to modify the [network security group (NSG) / virtual network gateway / virtual network / route table] to allow connections to TCP port 8080 on the virtual machine.

Explanation:
When you create a virtual machine, the default setting is to create a Network Security Group attached to the network interface assigned to a virtual machine.
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.
In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 8080.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 258 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can create custom Azure roles to control access to resources.	○	○
A user account can be assigned to multiple Azure roles.	○	○
A resource group can have the Owner role assigned to multiple users.	○	○

Answer:

Answer Area

Statements	Yes	No
You can create custom Azure roles to control access to resources.	○	○
A user account can be assigned to multiple Azure roles.	○	○
A resource group can have the Owner role assigned to multiple users.	○	○

Explanation:

Yes

Yes

Yes

Yes, in Azure, a resource group can have the Owner role assigned to multiple users. The Owner role is a built-in role in Azure that provides full access to all resources in a resource group, including the ability to create, modify, and delete resources.

When you assign the Owner role to a user or group, it grants them full access to all resources within the resource group. Multiple users or groups can be assigned the Owner role for a resource group, which allows for collaboration and delegation of responsibilities among different teams or individuals.

It's important to note that assigning the Owner role to multiple users or groups can increase the risk of accidental or intentional changes to resources within the resource group. Therefore, it's recommended to carefully consider the access needs of each user or group and assign roles accordingly to minimize the risk of unauthorized access or accidental changes.

Question: 259 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify a network security group (NSG).
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can

use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.
In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 260 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify a DDoS protection plan.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
DDoS is a form of attack on a network resource. A DDoS protection plan is used to protect against DDoS attacks; it does not provide connectivity to a virtual machine.
To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/ddos-protection-overview

Question: 261 CertyIQ

You need to collect and automatically analyze security events from Azure Active Directory (Azure AD).
What should you use?

A. Azure Sentinel
B. Azure Synapse Analytics
C. Azure AD Connect
D. Azure Key Vault

Answer: A

Explanation:

Microsoft Azure Sentinel is a scalable, cloud-native, security information event management (SIEM) and

security orchestration automated response (SOAR) solution. Azure Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for alert detection, threat visibility, proactive hunting, and threat response.

Azure Sentinel comes with a number of connectors for Microsoft solutions, available out of the box and providing real-time integration, including Microsoft 365 Defender (formerly Microsoft Threat Protection) solutions, and Microsoft 365 sources, including Office 365, Azure AD, Microsoft Defender for Identity (formerly Azure ATP), and Microsoft Cloud App Security, and more.

Reference:

https://docs.microsoft.com/en-us/azure/sentinel/overview

Question: 262 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify an Azure firewall.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:

Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.

In this question, we need to add a rule to Azure Firewall to allow the connection to the virtual machine on port 80 (HTTP).

References:

https://docs.microsoft.com/en-us/azure/firewall/overview

Question: 263 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
Azure Germany can be used by legal residents of Germany only.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. no change is needed
B. only enterprises that are registered in Germany
C. only enterprises that purchase their azure licenses from a partner based in Germany
D. any user or enterprise that requires its data to reside in Germany

Answer: D

Explanation:
Azure Germany is available to eligible customers and partners globally who intend to do business in the EU/EFTA, including the United Kingdom.
Azure Germany offers a separate instance of Microsoft Azure services from within German datacenters. The datacenters are in two locations, Frankfurt/Main and
Magdeburg. This placement ensures that customer data remains in Germany and that the datacenters connect to each other through a private network. All customer data is exclusively stored in those datacenters. A designated German company--the German data trustee--controls access to customer data and the systems and infrastructure that hold customer data.

Reference:
https://docs.microsoft.com/en-us/azure/germany/germany-welcome?toc=%2fazure%2fgermany%2ftoc.json
https://docs.microsoft.com/en-us/azure/germany/germany-overview-data-trustee

Question: 264 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Identities stored in an on-premises Active Directory can be synchronized to Azure Active Directory (Azure AD).	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Answer:

Answer Area

Statements	Yes	No
Identities stored in an on-premises Active Directory can be synchronized to Azure Active Directory (Azure AD).	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Explanation:
Box 1: Yes -
The tool you would use to sync the accounts is Azure AD Connect. The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD.

Box 2: Yes -
As described above, third-party cloud services and on-premises Active Directory can be used to access Azure resources. This is known as 'federation'.
Federation is a collection of domains that have established trust. The level of trust may vary, but typically includes authentication and almost always includes authorization. A typical federation might include a number of organizations that have established trust for shared access to a set of resources.

Box 3: Yes -
Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-whatis
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/whatis-fed https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-scenarios

Question: 265 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

. You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Azure Security Center

Answer:

Answer Area

. You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Azure Security Center (selected)

Explanation:
The advanced monitoring capabilities in Security Center lets you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

Reference:
https://docs.microsoft.com/en-us/azure/security-center/security-center-intro

Question: 266 CertyIQ

What should you use to evaluate whether your company's Azure environment meets regulatory requirements?

A. Azure Service Health
B. Azure Knowledge Center
C. Azure Security Center
D. Azure Advisor

Answer: C

Explanation:
The advanced monitoring capabilities in Security Center lets you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

Reference:
https://docs.microsoft.com/en-us/azure/security-center/security-center-intro

Question: 267 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.

Hot Area:

Answer Area

Your company implements [ ] to

- Azure policies
- DDoS protection
- Azure Information Protection
- Azure Active Directory (Azure AD) Identity Protection

automatically add a watermark to Microsoft Word documents that contain credit card information.

Answer:

Answer Area

Your company implements [Azure Information Protection] to

- Azure policies
- DDoS protection
- Azure Information Protection
- Azure Active Directory (Azure AD) Identity Protection

automatically add a watermark to Microsoft Word documents that contain credit card information.

Explanation:
Azure Information Protection is used to automatically add a watermark to Microsoft Word documents that contain credit card information.
You use Azure Information Protection labels to apply classification to documents and emails. When you do this, the classification is identifiable regardless of where the data is stored or with whom it's shared. The labels can include visual markings such as a header, footer, or watermark.
Labels can be applied automatically by administrators who define rules and conditions, manually by users, or a combination where users are given recommendations. In this question, we would configure a label to be automatically applied to Microsoft Word documents that contain credit card information. The label would then add the watermark to the documents.

Reference:
https://docs.microsoft.com/en-us/azure/information-protection/what-is-information-protection
https://docs.microsoft.com/en-us/azure/information-protection/infoprotect-quick-start-tutorial

Question: 268 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) requires the implementation of domain controllers on Azure virtual machines.	○	○
Azure Active Directory (Azure AD) provides authentication services for resources hosted in Azure and Microsoft 365.	○	○
Each user account in Azure Active Directory (Azure AD) can be assigned only one license.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) requires the implementation of domain controllers on Azure virtual machines.	○	○
Azure Active Directory (Azure AD) provides authentication services for resources hosted in Azure and Microsoft 365.	○	○
Each user account in Azure Active Directory (Azure AD) can be assigned only one license.	○	○

Explanation:

Box 1: No -
Azure Active Directory (Azure AD) is a cloud-based service. It does not require domain controllers on virtual machines.

Box 2: Yes -
Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources and Microsoft 365.

Box 3: No -
User accounts in Azure Active Directory can be assigned multiple licenses for different Azure or Microsoft 365 services.

Question: 269 CertyIQ

Which two types of customers are eligible to use Azure Government to develop a cloud solution? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. a Canadian government contractor
B. a European government contractor
C. a United States government entity
D. a United States government contractor
E. a European government entity

Answer: CD

Explanation:
Azure Government is a cloud environment specifically built to meet compliance and security requirements for US government. This mission-critical cloud delivers breakthrough innovation to U.S. government customers and their partners. Azure Government applies to government at any level " from state and local governments to federal agencies including Department of Defense agencies.
The key difference between Microsoft Azure and Microsoft Azure Government is that Azure Government is a sovereign cloud. It's a physically separated instance of Azure, dedicated to U.S. government workloads only. It's built exclusively for government agencies and their solution providers.

Reference:
https://docs.microsoft.com/en-us/learn/modules/intro-to-azure-government/2-what-is-azure-government

Question: 270 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
To implement an Azure Multi-Factor Authentication (MFA) solution, you must sync on-premises identities to the cloud.	○	○
Two valid methods for Azure Multi-Factor Authentication (MFA) are picture identification and a passport number.	○	○
Azure Multi-Factor Authentication (MFA) can be required for administrative and non-administrative user accounts.	○	○

Answer:

Answer Area

Statements	Yes	No
To implement an Azure Multi-Factor Authentication (MFA) solution, you must sync on-premises identities to the cloud.	○	●
Two valid methods for Azure Multi-Factor Authentication (MFA) are picture identification and a passport number.	○	●
Azure Multi-Factor Authentication (MFA) can be required for administrative and non-administrative user accounts.	●	○

Explanation:
Box 1: No -
It is not true that you must deploy a federation solution or sync on-premises identities to the cloud. You can have a cloud-only environment and use MFA.

Box 2: No -
Picture identification and passport numbers are not valid MFA authentication methods. Valid methods include: Password, Microsoft Authenticator App, SMS and
Voice call.
Box 3:
You can configure MFA to be required for administrator accounts only or you can configure MFA for any user account.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/authentication/howto-mfa-getstarted
https://docs.microsoft.com/en-us/azure/active-directory/authentication/concept-authentication-methods

Question: 271 CertyIQ

You need to ensure that when Azure Active Directory (Azure AD) users connect to Azure AD from the Internet by using an anonymous IP address, the users are prompted automatically to change their password.
Which Azure service should you use?

A. Azure AD Connect Health
B. Azure AD Privileged Identity Management
C. Azure Advanced Threat Protection (ATP)
D. Azure AD Identity Protection

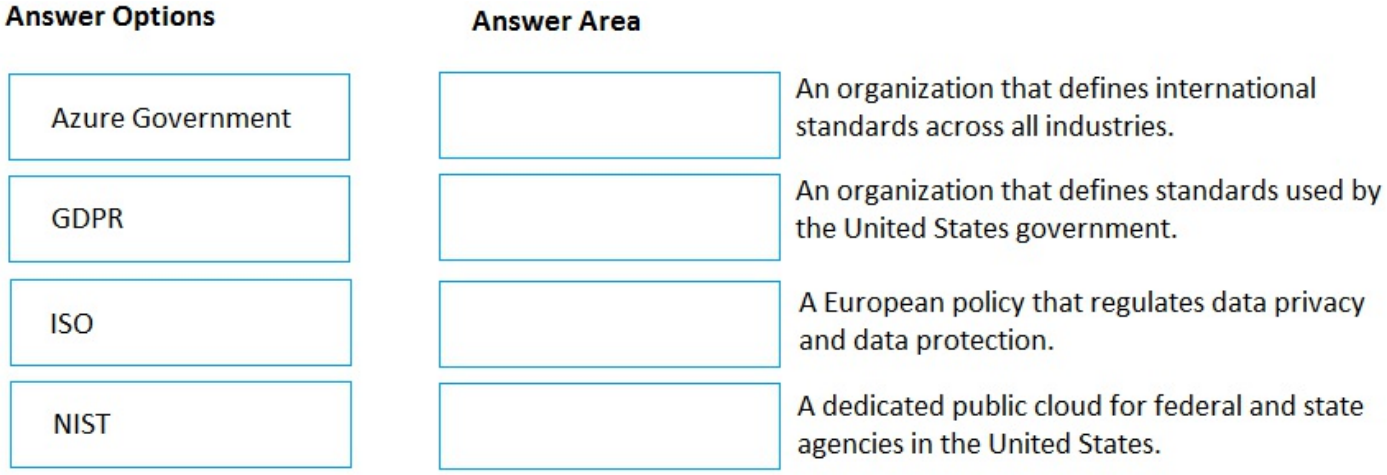
Answer: D

Explanation:
Azure AD Identity Protection includes two risk policies: sign-in risk policy and user risk policy. A sign-in risk represents the probability that a given authentication request isn't authorized by the identity owner.
There are several types of risk detection. One of them is Anonymous IP Address. This risk detection type indicates sign-ins from an anonymous IP address (for example, Tor browser or anonymous VPN). These IP addresses are typically used by actors who want to hide their login telemetry (IP address, location, device, etc.) for potentially malicious intent.
You can configure the sign-in risk policy to require that users change their password.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy
https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/concept-identity-protection-risks

Question: 272 CertyIQ

DRAG DROP -
Match the term to the correct definition.
Instructions: To answer, drag the appropriate term from the column on the left to its description on the right. Each term may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:



Answer:

Explanation:
Box 1: ISO -
ISO is the International Organization for Standardization. Companies can be certified to ISO standards, for example ISO 9001 or 27001 are commonly used in IT companies.

Box 2: NIST -
The National Institute of Standards and Technology (NIST) is a physical sciences laboratory, and a non-regulatory agency of the United States Department of
Commerce.

Box 3: GDPR -
GDPR is the General Data Protection Regulations. This standard was adopted across Europe in May 2018 and

replaces the now deprecated Data Protection
Directive.
The General Data Protection Regulation (EU) (GDPR) is a regulation in EU law on data protection and privacy in the European Union (EU) and the European
Economic Area (EEA). It also addresses the transfer of personal data outside the EU and EEA areas. The GDPR aims primarily to give control to individuals over their personal data and to simplify the regulatory environment for international business by unifying the regulation within the EU.

Box 4: Azure Government -
US government agencies or their partners interested in cloud services that meet government security and compliance requirements, can be confident that
Microsoft Azure Government provides world-class security, protection, and compliance services. Azure Government delivers a dedicated cloud enabling government agencies and their partners to transform mission-critical workloads to the cloud. Azure Government services handle data that is subject to certain government regulations and requirements, such as FedRAMP, NIST 800.171 (DIB), ITAR, IRS 1075, DoD L4, and CJIS. In order to provide you with the highest level of security and compliance, Azure Government uses physically isolated datacenters and networks (located in U.S. only).

Reference:
https://en.wikipedia.org/wiki/National_Institute_of_Standards_and_Technology
https://en.wikipedia.org/wiki/General_Data_Protection_Regulation https://docs.microsoft.com/en-us/azure/azure-government/documentation-government-welcome

Question: 273 CertyIQ

To what should an application connect to retrieve security tokens?

A. an Azure Storage account
B. Azure Active Directory (Azure AD)
C. a certificate store
D. an Azure key vault

Answer: D

Explanation:

Key Vault is designed to store configuration secrets for server apps.

Incorrect Answers:

A: An Azure Storage account is used to store data. It is not used to store secrets for applications.

B: Azure Active Directory (Azure AD) is a centralized identity provider in the cloud that authenticates users and provides access tokens to them. It is not used for applications.

Reference:

https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault
https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview

Question: 274 CertyIQ

Your network contains an Active Directory forest. The forest contains 5,000 user accounts.
Your company plans to migrate all network resources to Azure and to decommission the on-premises data center.
You need to recommend a solution to minimize the impact on users after the planned migration.
What should you recommend?

A. Implement Azure Multi-Factor Authentication (MFA)
B. Sync all the Active Directory user accounts to Azure Active Directory (Azure AD)
C. Instruct all users to change their password
D. Create a guest user account in Azure Active Directory (Azure AD) for each user

Answer: B

Explanation:
To migrate to Azure and decommission the on-premises data center, you would need to create the 5,000 user accounts in Azure Active Directory. The easy way to do this is to sync all the Active Directory user accounts to Azure Active Directory (Azure AD). You can even sync their passwords to further minimize the impact on users. The tool you would use to sync the accounts is Azure AD Connect. The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-whatis

Question: 275 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can configure the Azure Active Directory (Azure AD) activity logs to appear in Azure Monitor.	○	○
From Azure Monitor, you can monitor resources across multiple Azure subscriptions.	○	○
From Azure Monitor, you can create alerts.	○	○

Answer:

Answer Area

Statements	Yes	No
You can configure the Azure Active Directory (Azure AD) activity logs to appear in Azure Monitor.	○	○
From Azure Monitor, you can monitor resources across multiple Azure subscriptions.	○	○
From Azure Monitor, you can create alerts.	○	○

Explanation:
Box 1: Yes -
You can send Azure AD activity logs to Azure Monitor logs to enable rich visualizations, monitoring and alerting on the connected data.
All data collected by Azure Monitor fits into one of two fundamental types, metrics and logs (including Azure AD activity logs). Activity logs record when resources are created or modified. Metrics tell you how the resource is performing and the resources that it's consuming.

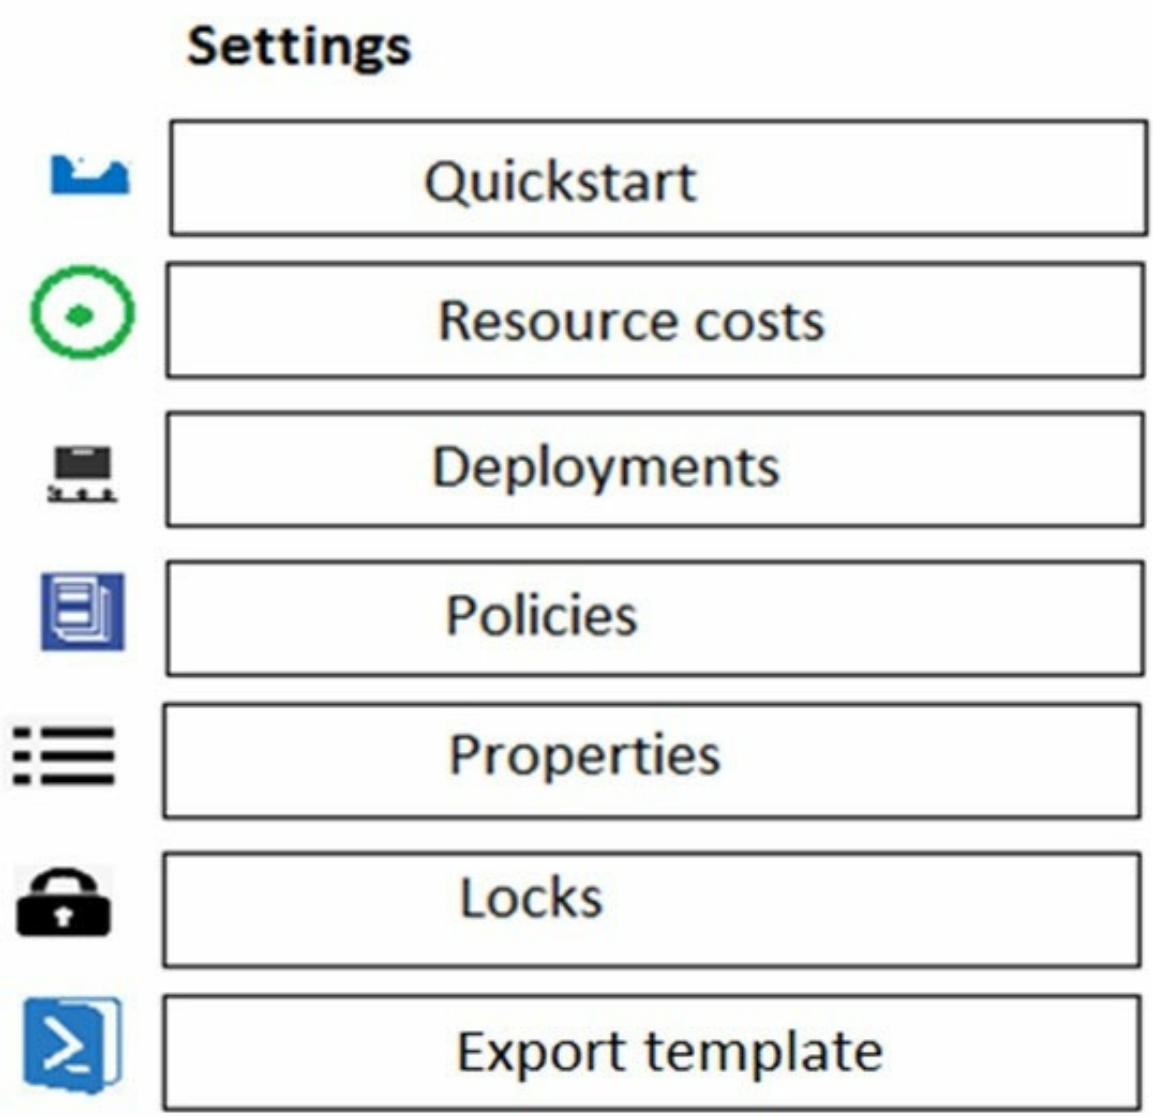
Box 2: Yes -
Azure Monitor can consolidate log entries from multiple Azure resources, subscriptions, and tenants into one location for analysis together.

Box 3: Yes -
You can create alerts in Azure Monitor.
Alerts in Azure Monitor proactively notify you of critical conditions and potentially attempt to take corrective action. Alert rules based on metrics provide near real time alerting based on numeric values, while rules based on logs allow for complex logic across data from multiple sources.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/reports-monitoring/concept-activity-logs-azure-monitor https://docs.microsoft.com/en-us/azure/azure-monitor/overview

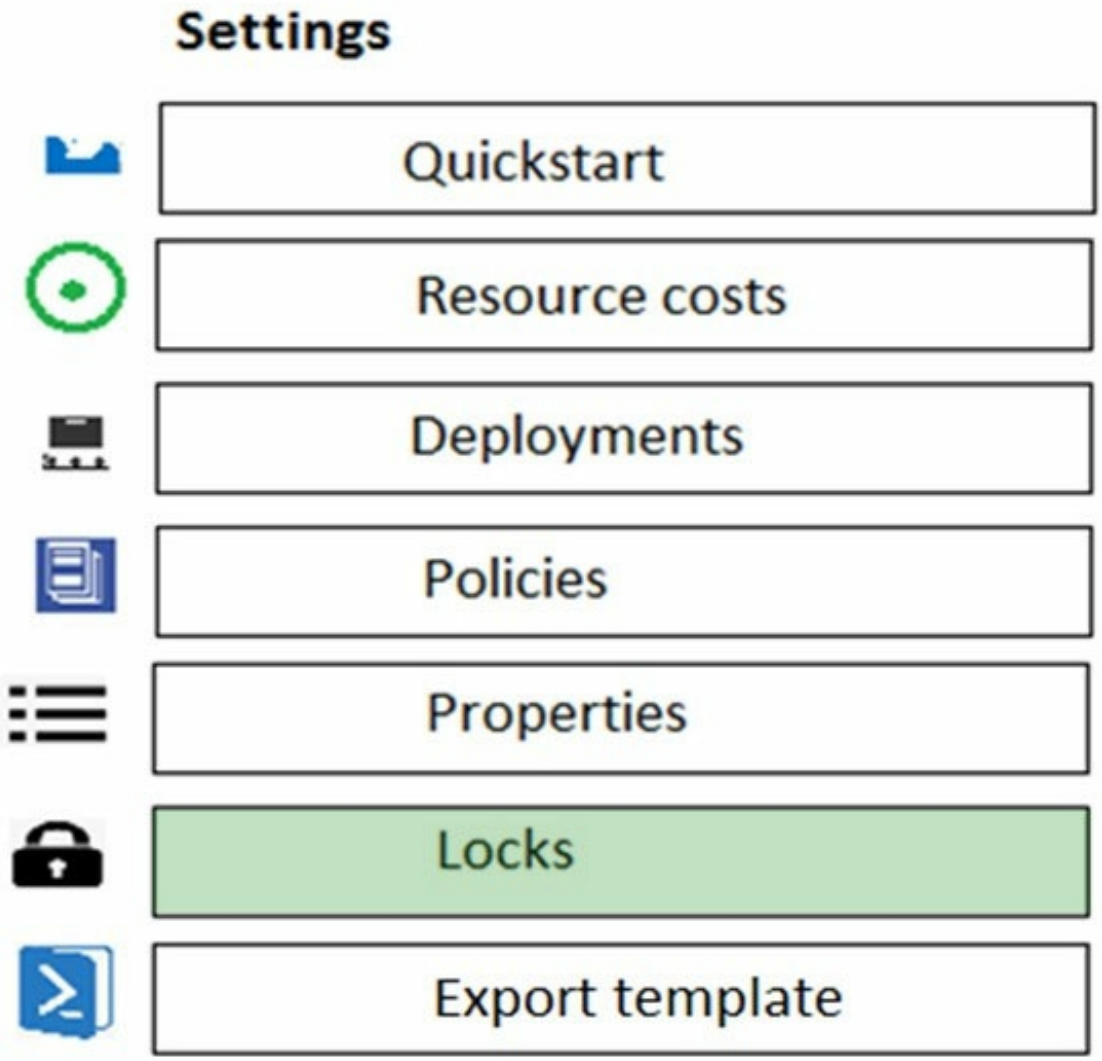
Question: 276 CertyIQ

HOTSPOT -
You create a resource group named RG1 in Azure Resource Manager.
You need to prevent the accidental deletion of the resources in RG1.
Which setting should you use? To answer, select the appropriate setting in the answer area.
Hot Area:



Settings
Quickstart
Resource costs
Deployments
Policies
Properties
Locks
Export template

Answer:



Explanation:
You can configure a lock on a resource group to prevent the accidental deletion.
As an administrator, you may need to lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources. You can set the lock level to CanNotDelete or ReadOnly. In the portal, the locks are called Delete and Read-only respectively.
✑ CanNotDelete means authorized users can still read and modify a resource, but they can't delete the resource.
✑ ReadOnly means authorized users can read a resource, but they can't delete or update the resource.
Applying this lock is similar to restricting all authorized users to the permissions granted by the Reader role.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-lock-resources

Question: 277 CertyIQ

You have a resource group named RG1.
You need to prevent the creation of virtual machines in RG1. The solution must ensure that other objects can be created in RG1.
What should you use?

A. a lock
B. an Azure role
C. a tag
D. an Azure policy

Answer: D

Explanation:
Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.
Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements.
In this question, we would create an Azure policy assigned to the resource group that denies the creation of virtual machines in the resource group.
You could place a read-only lock on the resource group. However, that would prevent the creation of any resources in the resource group, not virtual machines only. Therefore, an Azure Policy is a better solution.

Reference:
https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 278 CertyIQ

You have an Azure subscription and 100 Windows 10 devices.
You need to ensure that only users whose devices have the latest security patches installed can access Azure Active Directory (Azure AD)-integrated applications.
What should you implement?

A. a conditional access policy
B. Azure Bastion
C. Azure Firewall
D. Azure Policy

Answer: A

Explanation:

A conditional access policy is a feature of Azure Active Directory (Azure AD) that enables you to control access to cloud applications based on a set of conditions. You can use a conditional access policy to restrict access to Azure AD-integrated applications to only those devices that meet certain security requirements, such as having the latest security patches installed.

By implementing a conditional access policy, you can ensure that only users whose devices have the latest security patches can access Azure AD-integrated applications, while blocking access for users with devices that do not meet the security requirements.

Reference:

https://docs.microsoft.com/en-us/azure/active-directory/conditional-access/concept-conditional-access-policies

Question: 279 CertyIQ

What can Azure Information Protection encrypt?

A. network traffic
B. documents and email messages
C. an Azure Storage account
D. an Azure SQL database

Answer: B

Explanation:
Azure Information Protection can encrypt documents and emails.
Azure Information Protection is a cloud-based solution that helps an organization to classify and optionally, protect its documents and emails by applying labels.
Labels can be applied automatically by administrators who define rules and conditions, manually by users, or a combination where users are given recommendations.
The protection technology uses Azure Rights Management (often abbreviated to Azure RMS). This technology is integrated with other Microsoft cloud services and applications, such as Office 365 and Azure Active Directory.
This protection technology uses encryption, identity, and authorization policies. Similarly to the labels that are applied, protection that is applied by using Rights
Management stays with the documents and emails, independently of the location " inside or outside your organization, networks, file servers, and applications.

Reference:
https://docs.microsoft.com/en-us/azure/information-protection/what-is-information-protection
https://docs.microsoft.com/en-us/azure/information-protection/quickstart-label-dnf-protectedemail

Question: 280 CertyIQ

What should you use to evaluate whether your company's Azure environment meets regulatory requirements?

A. the Knowledge Center website
B. the Advisor blade from the Azure portal
C. Compliance Manager from the Service Trust Portal
D. the Solutions blade from the Azure portal

Answer: C

Explanation:

Compliance Manager in the Service Trust Portal is a workflow-based risk assessment tool that helps you track, assign, and verify your organization's regulatory compliance activities related to Microsoft Cloud services, such as Microsoft 365, Dynamics 365, and Azure.

Compliance Manager has moved from the Service Trust Portal to its new location in the Microsoft 365 compliance center

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

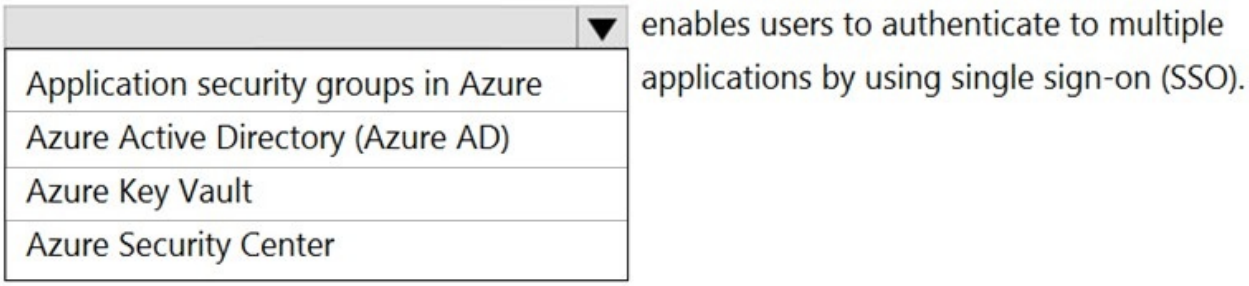
Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

Question: 281 CertyIQ

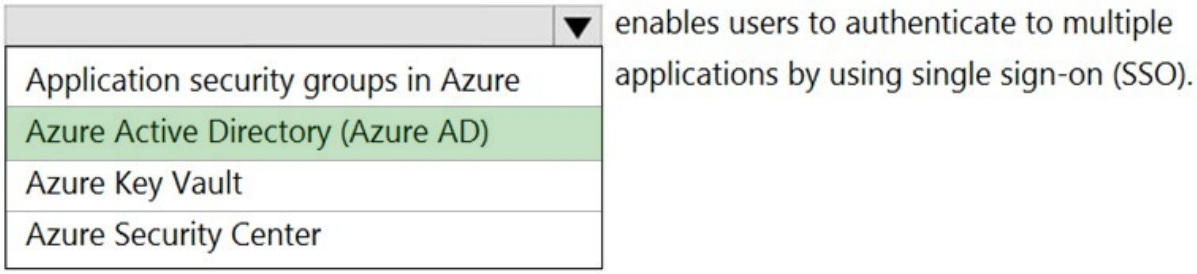
HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

Azure AD provides services such as:

- Single sign-on: Single sign-on (SSO) enables you to remember only one username and one password to access multiple applications. A single identity is tied to a user, which simplifies the security model. As users change roles or leave an organization, access modifications are tied to that identity, which greatly reduces the effort needed to change or disable accounts.

https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/3-authentication-methods

Question: 282 CertyIQ

You have an Azure subscription.
Where will you find details on the personal data collected by Microsoft, how Microsoft uses the data, and what the data is used for?

A. the Data Protection Addendum
B. the Microsoft Online Services Terms
C. the Microsoft Privacy Statement
D. Azure Security Center

Answer: C

Explanation:
The Microsoft Privacy Statement explains the personal data Microsoft processes, how Microsoft processes it, and for what purposes. Your applicable Services
Agreement or the Preview Supplemental Terms may specify lesser or different privacy measures for some Preview services.

Reference:
https://azure.microsoft.com/en-us/support/legal/

Question: 283 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) can be used to manage access to on-premises applications.	○	○
Azure Active Directory (Azure AD) provides single sign-on (SSO).	○	○
iOS devices can be registered in Azure Active Directory (Azure AD).	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) can be used to manage access to on-premises applications.	○	○
Azure Active Directory (Azure AD) provides single sign-on (SSO).	○	○

Question: 284 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1 [ ]

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Answer:

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1 [ ]

- is deleted automatically.
- is moved automatically to another resource group.
- **continues to function normally.**
- is now a read-only object.

Explanation:

The VNet will be marked as 'Non-compliant' when the policy is assigned. However, it will not be deleted and will continue to function normally.

Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements.

If there are any existing resources that aren't compliant with a new policy assignment, they appear under Non-compliant resources.

Question: 286

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can use Azure Policy to apply tags to resources	○	○
You can add multiple tags to the same Azure resource	○	○
An Azure resource inherits tags from the resource group to which the resource is deployed	○	○

Answer:

Answer Area

Statements	Yes	No
You can use Azure Policy to apply tags to resources	○	○
You can add multiple tags to the same Azure resource	○	○
An Azure resource inherits tags from the resource group to which the resource is deployed	○	○

Explanation:

Box 1: Yes -
You use Azure Policy to enforce tagging rules and conventions.

Box 2: Yes -
Each resource or resource group can have a maximum of 50 tags.

Box 3: No -
Tags applied to the resource group or subscription aren't inherited by the resources.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-policies
https://docs.microsoft.com/en-us/azure/governance/policy/tutorials/govern-tags
https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources

Question: 287 CertyIQ

DRAG DROP -
Match the resources to the appropriate descriptions.
To answer, drag the appropriate resource from the column on the left to its description on the right. Each resource may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Resources	Answer Area	
Data Protection Addendum	Resource	Describes which personal data is collected, how the data is used, and what the data is used for.
Microsoft Privacy Statement	Resource	A legal agreement that details the obligations between Microsoft and a customer regarding the processing and security of customer data and personal data.
Online Services Terms	Resource	Defines the data processing and security terms for online services, including the disclosure of processed data and the transfer, retention, and deletion of data.

Answer:

Resources	Answer Area	
Data Protection Addendum	Microsoft Privacy Statement	Describes which personal data is collected, how the data is used, and what the data is used for.
Microsoft Privacy Statement	Online Services Terms	A legal agreement that details the obligations between Microsoft and a customer regarding the processing and security of customer data and personal data.
Online Services Terms	Data Protection Addendum	Defines the data processing and security terms for online services, including the disclosure of processed data and the transfer, retention, and deletion of data.

Explanation:

1. Microsoft Privacy Statement.

2. Online Services Terms: The Online Services Terms (OST) is a legal agreement between Microsoft and the customer. The OST details the obligations by both parties with respect to the processing and security of customer data and personal data. The OST applies specifically to Microsoft's online services that you license through a subscription, including Azure, Dynamics 365, Office 365, and Bing Maps.

3. Data Protection Addendum: The Data Protection Addendum (DPA) further defines the data processing and security terms for online services. These terms include, Disclosure of processed data, Data transfer, retention, and deletion, etc..

https://docs.microsoft.com/en-gb/learn/modules/examine-privacy-compliance-data-protection-standards/3-access-microsoft-privacy-statement

Question: 288

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Requiring a user to enter a password and answer a security question when signing-in to Azure Active Directory (Azure AD) is an example of

- business-to-customer (B2C) identity services.
- managed identities.
- multi-factor authentication (MFA).
- role-based access control (RBAC).

Answer:

Answer Area

Requiring a user to enter a password and answer a security question when signing-in to Azure Active Directory (Azure AD) is an example of

- business-to-customer (B2C) identity services.
- managed identities.
- multi-factor authentication (MFA).
- role-based access control (RBAC).

Explanation:

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/authentication/concept-mfa-howitworks

Question: 289 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure China

- is operated by Microsoft.
- has feature parity with Azure global.
- services can be accessed from China only.
- is a distinct separate instance of Microsoft Azure.

Answer:

Answer Area

Azure China

- is operated by Microsoft.
- has feature parity with Azure global.
- services can be accessed from China only.
- is a distinct separate instance of Microsoft Azure.

Explanation:

“is a distinct separate instance of Microsoft Azure”

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China.

Question: 290 CertyIQ

What should you use to evaluate whether your company's Azure environment meets regulatory requirements?

A. Azure Service Health
B. Azure Knowledge Center
C. Microsoft Defender for Cloud
D. Azure Advisor

Answer: C

Explanation:

Microsoft Defender for Cloud helps streamline the process for meeting regulatory compliance requirements, using the regulatory compliance dashboard.

Reference:

https://docs.microsoft.com/en-us/azure/defender-for-cloud/regulatory-compliance-dashboard

Question: 291 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can review audit reports and compliance-related information for Azure services from

Microsoft Defender for Cloud.
the Microsoft Defender for Identity admin center.
the Microsoft 365 Compliance center.
the Microsoft Service Trust Portal.

Answer:

Answer Area

You can review audit reports and compliance-related information for Azure services from

Microsoft Defender for Cloud.
the Microsoft Defender for Identity admin center.
the Microsoft 365 Compliance center.
the Microsoft Service Trust Portal.

Explanation:

Microsoft Service Trust Portal.

The Microsoft Service Trust Portal provides a variety of content, tools, and other resources about Microsoft security, privacy, and compliance practices.

Trust Documents -

Provides a wealth of security implementation and design information with the goal of making it easier for you to meet regulatory compliance objectives by understanding how Microsoft Cloud services keep your data secure. To review content, select one of the following options on the Trust Documents pull-down menu.

* Audit Reports: A list of independent audit and assessment reports on Microsoft's Cloud services is displayed. These reports provide information about Microsoft

Cloud services compliance with data protection standards and regulatory requirements.

* Data Protection: Contains a wealth of resources such as audited controls, white papers, FAQs, penetration tests, risk assessment tools, and compliance guides.

* Azure Security and Compliance Blueprints: Resources that help you build secure and compliant cloud-based applications. This area contains blueprint-guidance for government, finance, healthcare, and retail verticals.

Incorrect:

Not: Microsoft Defender for Cloud.

Defender for Cloud is a tool for security posture management and threat protection. It strengthens the security posture of your cloud resources, and with its integrated Microsoft Defender plans, Defender for Cloud protects workloads running in Azure, hybrid, and other cloud platforms.

Defender for Cloud provides the tools needed to harden your resources, track your security posture, protect against cyber attacks, and streamline security management.

Not: the Microsoft 365 Compliance center

The Security & Compliance Center lets you grant permissions to people who perform compliance tasks like device management, data loss prevention, eDiscovery, retention, and so on. These people can perform only the tasks that you explicitly grant them access to.

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal

Question: 292

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The Microsoft Service Trust Portal can be accessed by using a Microsoft cloud services account.	○	○
Compliance Manager can be used to track your company's regulatory compliance activities related to Microsoft cloud services.	○	○
The My Library feature can be used to save Microsoft Service Trust Portal documents and resources in a single location.	○	○

Answer:

Answer Area

Statements	Yes	No
The Microsoft Service Trust Portal can be accessed by using a Microsoft cloud services account.	○	○
Compliance Manager can be used to track your company's regulatory compliance activities related to Microsoft cloud services.	○	○
The My Library feature can be used to save Microsoft Service Trust Portal documents and resources in a single location.	○	○

Explanation:

https://learn.microsoft.com/en-us/microsoft-365/compliance/compliance-manager

Microsoft Purview Compliance Manager is a feature in the Microsoft Purview compliance portal that helps you manage your organization's multicloud compliance requirements with greater ease and convenience. Compliance Manager can help you throughout your compliance journey, from taking inventory of your data protection risks to managing the complexities of implementing controls, staying current with regulations and certifications, and reporting to auditors.

https://learn.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide#all-documents

This section displays all available documents. Select the documents to save into your My Library section. Documents are sorted under the same categories shown under Certifications, Standards, Regulations, and Industry Resources. To view all resources for a particular cloud service use the Cloud Service filter.

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

Question: 293 CertyIQ

Your company has an Azure subscription that contains resources in several regions.
You need to create the Azure resource that must be used to meet the policy requirement.
What should you create?

A. a read-only lock
B. an Azure policy
C. a management group
D. a reservation

Answer: B

Explanation:
Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.
Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements. Azure Policy meets this need by evaluating your resources for non-compliance with assigned policies. All data stored by Azure Policy is encrypted at rest.
Azure Policy offers several built-in policies that are available by default. In this question, we would use the 'Allowed Locations' policy to define the locations where resources can be deployed.

Reference:
https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 294 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
From Azure Cloud Shell, you can track your company's regulatory standards and regulations, such as ISO 27001.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed.` If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed.
B. the Microsoft Cloud Partner Portal
C. Compliance Manager
D. the Trust Center

Answer: C

Explanation:

It used to be "Trust Center", but now it is called Microsoft Purview Compliance Manager.

https://docs.microsoft.com/en-us/microsoft-365/compliance/compliance-manager?view=o365-worldwide

Microsoft Compliance Manager (Preview) is a free workflow-based risk assessment tool that lets you track, assign, and verify regulatory compliance activities related to Microsoft cloud services. Azure Cloud Shell, on the other hand, is an interactive, authenticated, browser-accessible shell for managing Azure resources.

References:

https://docs.microsoft.com/en-us/microsoft-365/compliance/compliance-manager-overview
https://docs.microsoft.com/en-us/azure/cloud-shell/overview

Question: 295 CertyIQ

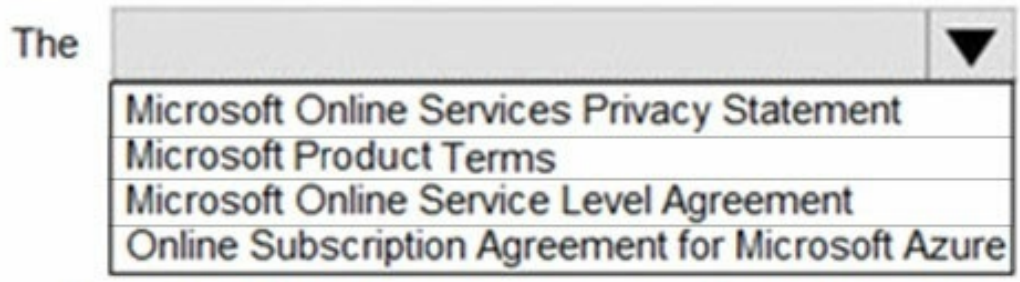
Question: 296 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

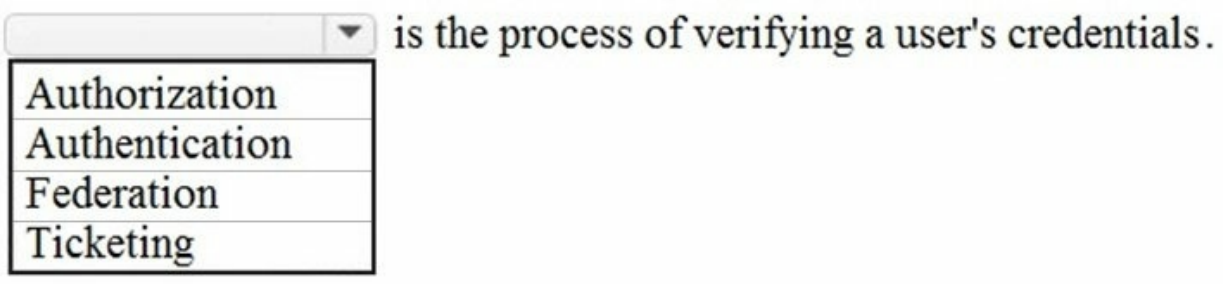
Explanation:
The Microsoft Privacy Statement explains what personal data Microsoft processes, how Microsoft processes the data, and the purpose of processing the data

Reference:
https://privacy.microsoft.com/en-us/privacystatement

Question: 297 CertyIQ

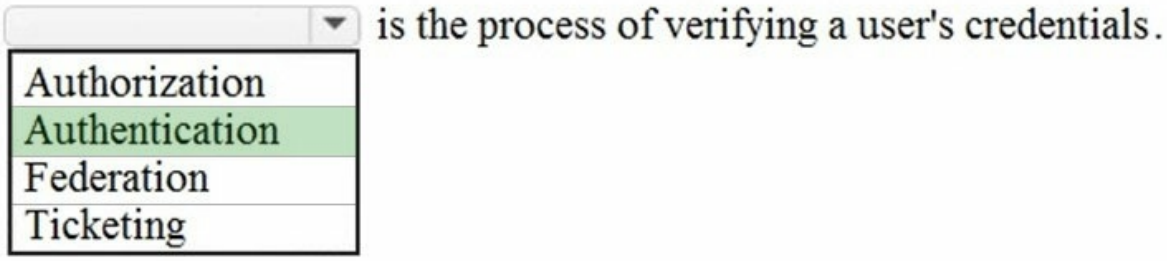
HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

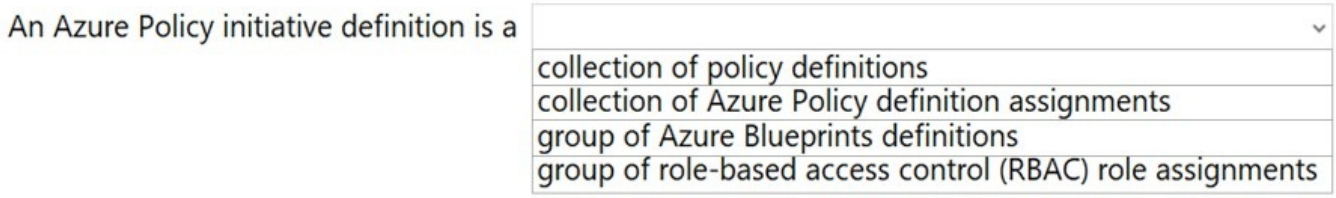
Answer Area



Explanation:
Authentication, not authorization is the process of verifying a user's credentials.
The difference between authentication and authorization is:
✑ Authentication is proving your identity, proving that you are who you say you are. The most common example of this is logging in to a system by providing credentials such as a username and password.
✑ Authorization is what you're allowed to do once you've been authenticated. For example, what resources you're allowed to access and what you can do with those resources.

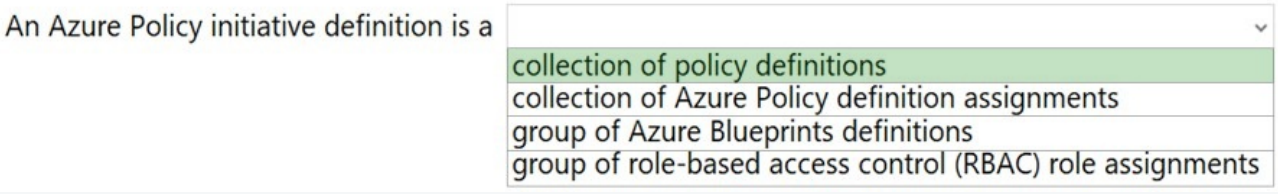
Question: 298 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:
Answer Area



Answer:

Answer Area



Explanation:

"collect of policy definitions" is the answer.

https://learn.microsoft.com/en-us/azure/governance/policy/overview#initiative-definition

An initiative definition is a collection of policy definitions that are tailored toward achieving a singular overarching goal. Initiative definitions simplify managing and assigning policy definitions. They simplify by grouping a set of policies as one single item. For example, you could create an initiative titled Enable Monitoring in Microsoft Defender for Cloud, with a goal to monitor all the available security recommendations in your Microsoft Defender for Cloud instance.

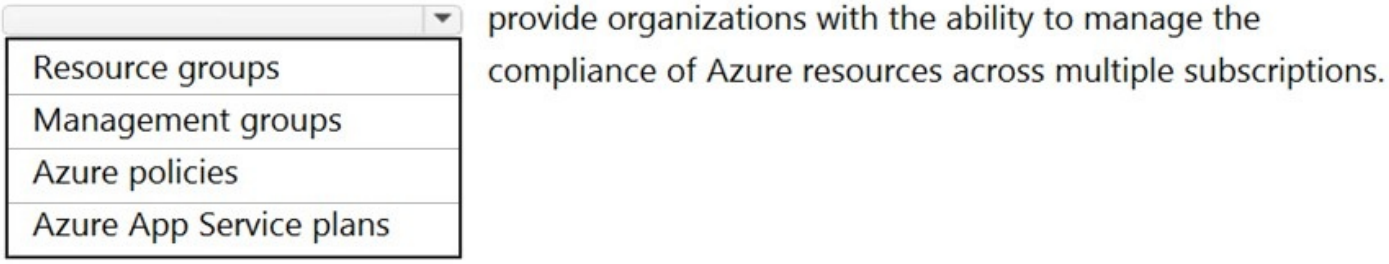
Reference:

https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 299 CertyIQ

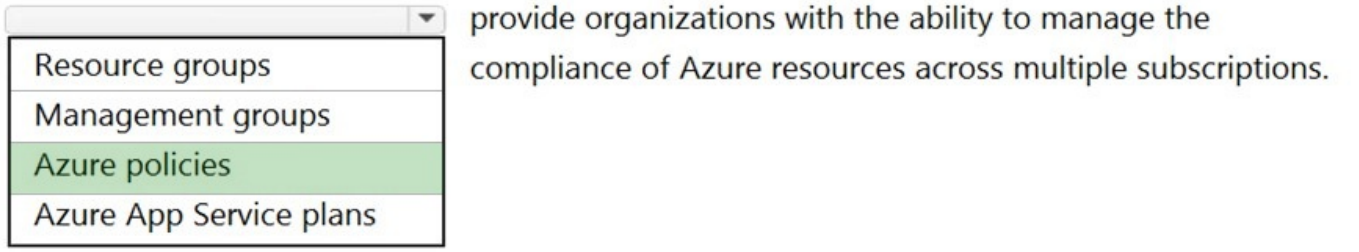
HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

"If your organization has many subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Azure management groups provide a level of scope above subscriptions. You organize subscriptions into containers called "management groups" and apply your governance conditions to the management groups. All subscriptions within a management group automatically inherit the conditions applied to the management group. Management groups give you enterprise-grade management at a large scale no matter what type of subscriptions you might have.....

For example, you can apply POLICIES to a management group that limits the regions available for virtual machine (VM) creation. This policy would be applied to all management groups, subscriptions, and RESOURES under that management group by only allowing VMs to be created in that region."

Reference:

https://docs.microsoft.com/en-us/azure/governance/policy/overview

https://docs.microsoft.com/en-us/azure/governance/management-groups/overview

Question: 300 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
General Data Protection Regulation (GDPR) defines data protection and privacy rules.	○	○
General Data Protection Regulation (GDPR) applies to companies that offer goods or services to individuals in the EU.	○	○
Azure can be used to build a General Data Protection Regulation (GDPR)-compliant infrastructure.	○	○

Answer:

Answer Area

Statements	Yes	No
General Data Protection Regulation (GDPR) defines data protection and privacy rules.	○	○
General Data Protection Regulation (GDPR) applies to companies that offer goods or services to individuals in the EU.	○	○
Azure can be used to build a General Data Protection Regulation (GDPR)-compliant infrastructure.	○	○

Explanation:

Reference:
https://azure.microsoft.com/en-gb/blog/new-capabilities-to-enable-robust-gdpr-compliance/

Question: 301

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can add an Azure Resource Manager template to an Azure blueprint.	○	○
You can assign an Azure blueprint to a resource group.	○	○
You can use Azure Blueprints to grant permissions to a resource.	○	○

Answer:

Answer Area

Statements	Yes	No
You can add an Azure Resource Manager template to an Azure blueprint.	○	○
You can assign an Azure blueprint to a resource group.	○	○
You can use Azure Blueprints to grant permissions to a resource.	○	○

Explanation:

Reference:

https://docs.microsoft.com/en-us/azure/governance/blueprints/overview

Based on https://docs.microsoft.com/en-us/azure/governance/blueprints/overview

Y: Each blueprint can consist of zero or more ARM template artifacts. This support means that previous efforts to develop and maintain a library of ARM templates are reusable in Azure Blueprints.

N:Create a new resource group for use by other artifacts WITHIN the blueprint. When creating a blueprint definition, you'll define where the blueprint is saved. Blueprints can be saved to a management group or subscription that you have Contributor access to. If the location is a management group, the blueprint is available to assign to any child subscription of that management group. Each Published Version of a blueprint can be assigned (with a max name length of 90 characters) to an existing management group or subscription.

Y:The blueprint definition permissions must be granted or inherited on the management group or subscription scope where it is saved --> Meaning this would grant permissions to the resources

Question: 302

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure China is operated by Microsoft.	○	○
Azure Government is operated by Microsoft.	○	○
Azure Government is available only to US government agencies and their partners.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure China is operated by Microsoft.	○	○
Azure Government is operated by Microsoft.	○	○
Azure Government is available only to US government agencies and their partners.	○	○

Explanation:

https://learn.microsoft.com/en-us/azure/china/overview-operations

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China. It's independently operated and transacted by Shanghai Blue Cloud Technology Co., Ltd. ("21Vianet"), a wholly owned subsidiary of Beijing 21Vianet Broadband Data Center Co., Ltd..

https://learn.microsoft.com/en-us/azure/azure-government/documentation-government-welcome

US government agencies or their partners interested in cloud services that meet government security and compliance requirements, can be confident that Microsoft Azure Government provides world-class security and compliance. Azure Government delivers a dedicated cloud enabling government agencies and their partners to transform mission-critical workloads to the cloud. Azure Government services can accommodate data that is subject to various US government regulations and requirements.

https://docs.microsoft.com/en-us/azure/china/overview-operations https://docs.microsoft.com/en-us/azure/azure-government/documentation-government-welcome

Question: 303 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
An Azure resource can have multiple Delete locks.	○	○
An Azure resource inherits locks from its resource group.	○	○
If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.	○	○

Answer:

Answer Area

Statements	Yes	No
An Azure resource can have multiple Delete locks.	○	○
An Azure resource inherits locks from its resource group.	○	○
If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.	○	○

Explanation:

An Azure resource can have multiple Delete locks.

Yes.

In Azure, you can apply multiple locks to a resource. However, only one lock of each type (ReadOnly, CanNotDelete) can be applied to a resource. So, while you can have multiple locks, they must be of different types.

An Azure resource inherits locks from its resource group.

Yes.

Azure resources inherit locks from their parent resource groups. If a resource group has a lock, all resources within that group will inherit the same lock unless explicitly overridden.

If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.

Yes.

You can add a Delete lock (CanNotDelete) to a resource that already has a Read-only lock. The Read-only lock prevents modifications, while the Delete lock prevents deletion. They serve different purposes and can coexist.

Question: 304 CertyIQ

Your company plans to migrate all on-premises data to Azure.
You need to identify whether Azure complies with the company's regional requirements.
What should you use?

A. the Knowledge Center
B. Azure Marketplace
C. the MyApps portal
D. the Trust Center

Answer: D

Explanation:
Azure has more than 90 compliance certifications, including over 50 specific to global regions and countries, such as the US, the European Union, Germany,
Japan, the United Kingdom, India and China.
You can view a list of compliance certifications in the Trust Center to determine whether Azure meets your regional requirements.

Reference:
https://azure.microsoft.com/en-gb/overview/trusted-cloud/compliance/ https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal

Question: 305 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Authorization to access Azure resources can be provided only to Azure Active Directory (Azure AD) users.	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Answer:

Answer Area

Statements	Yes	No
Authorization to access Azure resources can be provided only to Azure Active Directory (Azure AD) users.	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Explanation:

Box 1: No -
Authorization to access Azure resources can be provided by other identity providers by using federation. A commonly used example of this is to federate your on- premises Active Directory environment with Azure AD and use this federation for authentication and authorization.

Box 2: Yes -
As described above, third-party cloud services and on-premises Active Directory can be used to access Azure resources. This is known as 'federation'.
Federation is a collection of domains that have established trust. The level of trust may vary, but typically includes authentication and almost always includes authorization. A typical federation might include a number of organizations that have established trust for shared access to a set of resources.

Box 3: Yes -
Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/whatis-fed https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-scenarios

Question: 306 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

If a resource group named RG1 has a delete lock, [▼] can delete RG1.

- only a member of the global administrators group
- the delete lock must be removed before an administrator
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Answer:

Answer Area

If a resource group named RG1 has a delete lock,

only a member of the global administrators group
the delete lock must be removed before an administrator
an Azure policy must be modified before an administrator
an Azure tag must be added before an administrator

can delete RG1.

Explanation:

You can configure a lock on a resource group to prevent the accidental deletion of the resource group. The lock applies to everyone, including global administrators. If you want to delete the resource group, the lock must be removed first.

As an administrator, you may need to lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources. You can set the lock level to CanNotDelete or ReadOnly. In the portal, the locks are called Delete and Read-only respectively.

- CanNotDelete means authorized users can still read and modify a resource, but they can't delete the resource.

ReadOnly means authorized users can read a resource, but they can't delete or update the resource. Applying this lock is similar to restricting all authorized

- users to the permissions granted by the Reader role.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-lock-resources

Question: 307 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

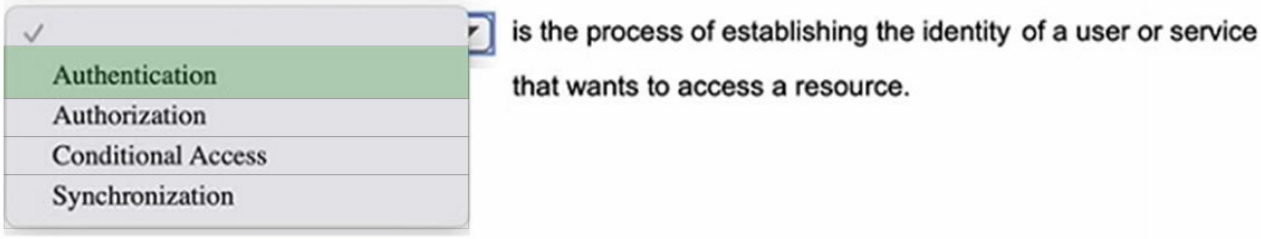
Answer Area

Authentication
Authorization
Conditional Access
Synchronization

is the process of establishing the identity of a user or service that wants to access a resource.

Answer:

Answer Area



Question: 308

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Single sign-on (SSO) requires that all users sign in by using the Microsoft Authenticator app.	○	○
Authentication is the process of establishing which level of access an authenticated user or service has.	○	○
Conditional Access uses signals collected from a user during the sign-in process to decide whether to allow or deny access requests.	○	○

Answer:

Answer Area

Statements	Yes	No
Single sign-on (SSO) requires that all users sign in by using the Microsoft Authenticator app.	○	○
Authentication is the process of establishing which level of access an authenticated user or service has.	○	○
Conditional Access uses signals collected from a user during the sign-in process to decide whether to allow or deny access requests.	○	○

Explanation:
Single sign-on is an authentication method that allows users to sign in using one set of credentials to login across applications. Single sign-on makes it easier to manage passwords and increases security capabilities.
Authorization is the process of establishing what level of access a legitimate user or service should have.
During sign-in, Conditional Access collects signals from the user, makes decisions based on those signals, and

then enforces that decision by allowing or denying the access request or challenging for a multifactor authentication response.

Question: 309 CertyIQ

What is guaranteed in an Azure Service Level Agreement (SLA) for virtual machines?

A. uptime
B. feature availability
C. bandwidth
D. performance

Answer: A

Explanation:
The SLA for virtual machines guarantees 'uptime'. The amount of uptime guaranteed depends on factors such as whether the VMs are in an availability set or availability zone if there is more than one VM, the distribution of the VMs if there is more than one or the disk type if it is a single VM.
The SLA for Virtual Machines states:
✑ For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have
Virtual Machine Connectivity to at least one instance at least 99.99% of the time.
✑ For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.
✑ For any Single Instance Virtual Machine using Premium SSD or Ultra Disk for all Operating System Disks and Data Disks, we guarantee you will have Virtual
Machine Connectivity of at least 99.9%.

Reference:

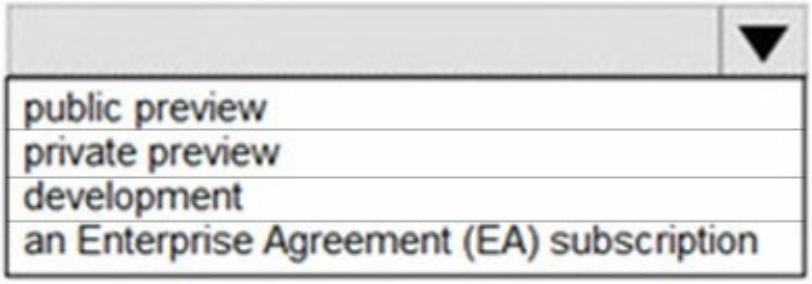
Question: 310 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

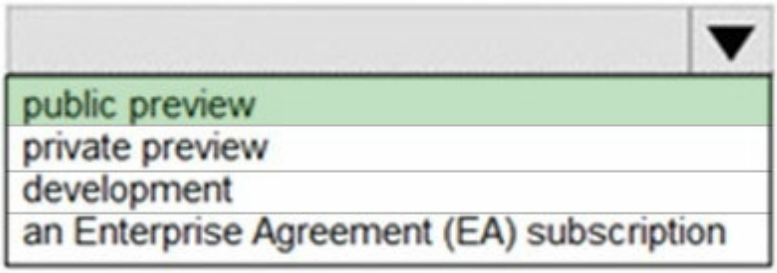
An Azure service is available to all Azure customers when it is in



Answer:

Answer Area

An Azure service is available to all Azure customers when it is in



Explanation:

Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Public previews are excluded from SLAs and in some cases, no support is offered.

Incorrect Answers:

Services in private preview are available only to selected people who has signed up to the private preview program.

- Services in development are not available to the public.
- Services provided under an Enterprise Agreement (EA) subscription are available only to the subscription owner.

https://www.neowin.net/news/several-more-azure-services-now-available-in-private-public-preview/

Question: 311 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to purchase an Azure subscription.

The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.

You need to recommend which support plan meets the support policy requirement.

Solution: Recommend a Basic support plan.

Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

B. No

The Basic support plan typically offers limited support, such as access to documentation, community forums, and self-help resources. It does not include technical support for troubleshooting, advisory support, or support for service-level agreements (SLAs). If the support policy requirement includes direct technical support, faster response times, or other advanced support features, a higher-tier plan like Developer, Standard, Professional Direct, or Premier would be more appropriate. Therefore, recommending a Basic support plan does not meet the goal if the requirement includes more comprehensive support services.

The Basic support plan does not have any technical support for engineers.

Access to Support Engineers via email or phone is available in the following support plans: Premier, Professional Direct and standard.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Question: 312 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to purchase an Azure subscription.
The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.
You need to recommend which support plan meets the support policy requirement.
Solution: Recommend a Standard support plan.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

Reference:
https://azure.microsoft.com/en-gb/support/plans/

Question: 313 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to purchase an Azure subscription.
The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.
You need to recommend which support plan meets the support policy requirement.
Solution: Recommend a Premier support plan.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:

The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Note:- The question is obsolete. Premier support is retired.

Question: 314 CertyIQ

Your company plans to request an architectural review of an Azure environment from Microsoft.
The company currently has a Basic support plan.
You need to recommend a new support plan for the company. The solution must minimize costs.
Which support plan should you recommend?

A. Premier
B. Developer
C. Professional Direct
D. Standard

Answer: C

Explanation:

Professional Direct provide Guidance from a pool of ProDirect delivery managers. Developer and standard provide general guidance. https://azure.microsoft.com/en-gb/support/plans/

Question: 315 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Most Azure services are introduced in private preview before being introduced in public preview, and then in general availability.	○	○
Azure services in public preview can be managed only by using the Azure CLI.	○	○
The cost of an Azure service in private preview decreases when the service becomes generally available.	○	○

Answer:

Answer Area

Statements	Yes	No
Most Azure services are introduced in private preview before being introduced in public preview, and then in general availability.	●	○
Azure services in public preview can be managed only by using the Azure CLI.	○	●
The cost of an Azure service in private preview decreases when the service becomes generally available.	○	●

Explanation:

Box 1: Yes -
Most services go to private preview then public preview before being released to general availability.
The private preview is only available to certain Azure customers for evaluation purposes. The public preview is available to all Azure customers.

Box 2: No -
Azure services in public preview can be managed using the regular management tools: Azure Portal, Azure CLI and PowerShell.

Box 3: No -
Services in private or public preview are usually offered at reduced costs. However, the costs increase, not decrease when the services are released to general availability.

Question: 316 CertyIQ

What is required to use Azure Cost Management?

A. a Dev/Test subscription
B. Software Assurance
C. an Enterprise Agreement (EA)
D. a pay-as-you-go subscription

Answer: D

Explanation:

D (pay-as-you-go). It also supports EA. The difference is in the kind of data managed in the Cost Management tool.

"Cost Management includes all usage and purchases, including reservations and third-party offerings for Enterprise Agreement (EA) accounts. Microsoft Customer Agreement accounts and individual subscriptions with pay-as-you-go rates only include usage from Azure and Marketplace services. Support and other costs aren't included."

https://learn.microsoft.com/en-gb/azure/cost-management-billing/costs/understand-cost-mgt-data

Question: 317 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

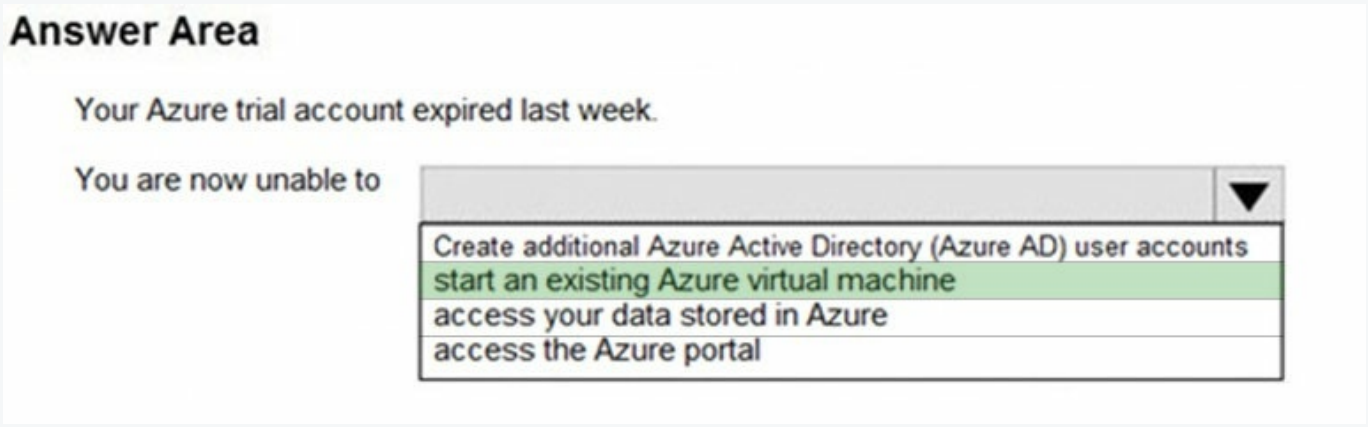
Answer Area

Your Azure trial account expired last week.

You are now unable to

- Create additional Azure Active Directory (Azure AD) user accounts
- start an existing Azure virtual machine
- access your data stored in Azure
- access the Azure portal

Answer:



Explanation:

A stopped (deallocated) VM is offline and not mounted on an Azure host server. Starting a VM mounts the VM on a host server before the VM starts. As soon as the VM is mounted, it becomes chargeable. For this reason, you are unable to start a VM after a trial has expired.

Incorrect Answers:

- You are not charged for Azure Active Directory user accounts so you can continue to create accounts.
- You can access data that is already stored in Azure.
- You can access the Azure Portal. You can also reactivate and upgrade the expired subscription in the portal.

Question: 318 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to purchase an Azure subscription.

The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.

You need to recommend which support plan meets the support policy requirement.

Solution: Recommend a Professional Direct support plan.

Does this meet the goal?

A. Yes

B. No

Answer: A

Explanation:

The Basic support plan does not have any technical support for engineers.

The Developer support plan has only technical support for engineers via email.

The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Question: 319 CertyIQ

Your company has a Software Assurance agreement that includes Microsoft SQL Server licenses.
You plan to deploy SQL Server on Azure virtual machines.
What should you do to minimize licensing costs for the deployment?

A. Deallocate the virtual machines during off hours.
B. Use Azure Hybrid Benefit.
C. Configure Azure Cost Management budgets.
D. Use Azure reservations.

Answer: B

Explanation:
Azure Hybrid Benefit is a licensing benefit that helps you to significantly reduce the costs of running your workloads in the cloud. It works by letting you use your on-premises Software Assurance-enabled Windows Server and SQL Server licenses on Azure.

Reference:
https://azure.microsoft.com/en-us/pricing/hybrid-benefit/

Question: 320 CertyIQ

Your company has 10 departments.
The company plans to implement an Azure environment.
You need to ensure that each department can use a different payment option for the Azure services it consumes.
What should you create for each department?

A. a reservation
B. a subscription
C. a resource group
D. a container instance

Answer: B

Explanation:
There are different payment options in Azure including pay-as-you-go (PAYG), Enterprise Agreement (EA), and Microsoft Customer Agreement (MCA) accounts.
Your Azure costs are 'per subscription'. You are charged monthly for all resources in a subscription. Therefore, to use different payment options per department, you will need to create a separate subscription per

department. You can create multiple subscriptions in a single Azure Active Directory tenant.
Incorrect Answers:
A: A reservation is where you commit to a resource (for example a virtual machine) for one or three years. This gives you a discounted price on the resource for the reservation period. Reservations do not provide a way to use different payment options per department.
C: A resource group is a logical container for Azure resources. You can view the total cost of all the resources in a resource group. However, resource groups do not provide a way to use different payment options per department.
D: A container instance is an Azure resource used to run an application. Container instances do not provide a way to use different payment options per department.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/create-subscription

Question: 321 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statements	Yes	No
An Azure free account has a spending limit.	○	○
An Azure free account has a limit of 2TB of data that can be uploaded to Azure.	○	○
An Azure free account can contain an unlimited number of web apps.	○	○

Answer:

Statements	Yes	No
An Azure free account has a spending limit.	○	○
An Azure free account has a limit of 2TB of data that can be uploaded to Azure.	○	○
An Azure free account can contain an unlimited number of web apps.	○	○

Explanation:
Box 1: Yes -
An Azure free account has a spending limit. This is currently 200 USD or 150 GBP.

Box 2: No -
Azure free account has a 5 GB blob storage limit and a 5 GB file storage limit.

Box 3: No -
Azure free account has a limit of 10 web, mobile or API apps

Reference:
https://azure.microsoft.com/en-us/free/
https://azure.microsoft.com/en-us/free/free-account-faq/
https://docs.microsoft.com/en-us/azure/billing/billing-avoid-charges-free-account

Question: 322 CertyIQ

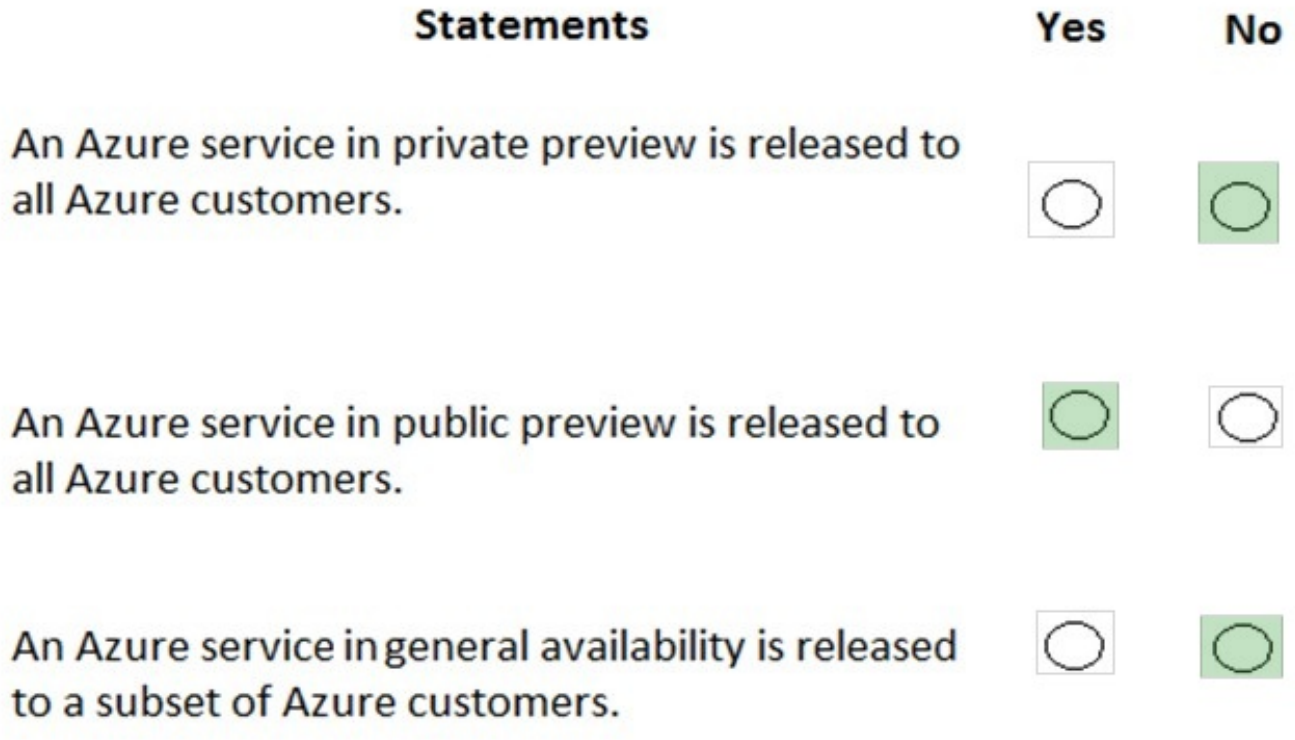
HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
An Azure service in private preview is released to all Azure customers.	○	○
An Azure service in public preview is released to all Azure customers.	○	○
An Azure service in general availability is released to a subset of Azure customers.	○	○

Answer:

Answer Area



Explanation:
Box 1: No -
Most services go to private preview then public preview before being released to general availability. The private preview is only available to certain Azure customers for evaluation purposes.

Box 2: Yes -
Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.
Public previews are excluded from SLAs and in some cases, no support is offered.

Box 3: No -
An Azure service in general availability is available to all Azure customers, not just a subset of the customers.

Reference:
https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms/

Question: 323 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
With a consumption-based plan, you pay a fixed rate for all data sent to or from virtual machines hosted in the cloud.	○	○
With a consumption-based plan, you reduce overall costs by paying only for extra capacity when it is required.	○	○
Serverless computing is an example of a consumption-based plan.	○	○

Answer:

Answer Area

Statements	Yes	No
With a consumption-based plan, you pay a fixed rate for all data sent to or from virtual machines hosted in the cloud.	○	●
With a consumption-based plan, you reduce overall costs by paying only for extra capacity when it is required.	●	○
Serverless computing is an example of a consumption-based plan.	●	○

Explanation:

1. So for consumption based plan, no fixed rate - N

2. extra capacity only when its required. no fixed rate - Y

3. Y

Question: 324

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The cost of Azure resources can vary between regions.	○	○
An Azure reservation is used to reserve server capacity at a specific data center.	○	○
You can stop an Azure SQL Database instance to decrease costs.	○	○

Answer:

Answer Area

Statements	Yes	No
The cost of Azure resources can vary between regions.	○	○
An Azure reservation is used to reserve server capacity at a specific data center.	○	○
You can stop an Azure SQL Database instance to decrease costs.	○	○

Explanation:

Y/Y/N

https://learn.microsoft.com/en-us/azure/cost-management-billing/reservations/manage-reserved-vm-instance

If you bought Azure Reserved Virtual Machine Instances, you can change the optimize setting for the reservation. The reservation discount can apply to VMs in the same series or you can reserve data center capacity for a specific VM size. You should try to optimize reservations so that they're fully used.

Question: 325

CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

You have an application that is comprised of an Azure web app that has a Service Level Agreement (SLA) of 99.95 percent and an Azure SQL database that has an SLA of 99.99 percent.

The composite SLA for the application is

the product of both SLAs, which equals 99.94 percent
the lowest SLA associated to the application, which is 99.95 percent
the highest SLA associated to the application, which is 99.99 percent
the difference between the two SLAs, which is 0.05 percent

Answer:

Answer Area

You have an application that is comprised of an Azure web app that has a Service Level Agreement (SLA) of 99.95 percent and an Azure SQL database that has an SLA of 99.99 percent.

The composite SLA for the application is

the product of both SLAs, which equals 99.94 percent
the lowest SLA associated to the application, which is 99.95 percent
the highest SLA associated to the application, which is 99.99 percent
the difference between the two SLAs, which is 0.05 percent

Explanation:

Composite SLAs involve multiple services supporting an application, each with differing levels of availability. For example, consider an App Service web app that writes to Azure SQL Database. At the time of this writing, these Azure services have the following SLAs:

App Service web apps = 99.95%

- SQL Database = 99.99%

What is the maximum downtime you would expect for this application? If either service fails, the whole application fails. The probability of each service failing is independent, so the composite SLA for this application is 99.95% * 99.99% = 99.94%. That's lower than the individual SLAs, which isn't surprising because an application that relies on multiple services has more potential failure points.

Reference:
https://docs.microsoft.com/en-us/azure/architecture/reliability/requirements#understand-service-level-agreements

Question: 326

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The Service Level Agreement (SLA) guaranteed uptime for paid Azure services is at least 99.9 percent.	○	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by adding Azure resources to multiple regions.	○	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by purchasing multiple subscriptions.	○	○

Answer:

Answer Area

Statements	Yes	No
The Service Level Agreement (SLA) guaranteed uptime for paid Azure services is at least 99.9 percent.	●	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by adding Azure resources to multiple regions.	●	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by purchasing multiple subscriptions.	○	●

Explanation:

Box 1: Yes -
SLA's vary based on the resource type and the location distribution of the resource. However, the minimum uptime for all Azure services is 99.9 percent.

Box 2: Yes -
The SLA guaranteed uptime is increased (usually to 99.95 percent) when resources are deployed across multiple regions.

Box 3: No -
The number of subscriptions is unrelated to uptime SLA's. You can deploy resources to multiple regions under a single subscription or you can have multiple subscriptions with resources deployed to the same region.

Reference:
https://azure.microsoft.com/en-us/support/legal/sla/summary/

Question: 327 CertyIQ

Which statement accurately describes the Modern Lifecycle Policy for Azure services?

A. Microsoft provides mainstream support for a service for five years.

B. Microsoft provides a minimum of 12 months' notice before ending support for a service.

C. After a service is made generally available, Microsoft provides support for the service for a minimum of four years.

D. When a service is retired, you can purchase extended support for the service for up to five years.

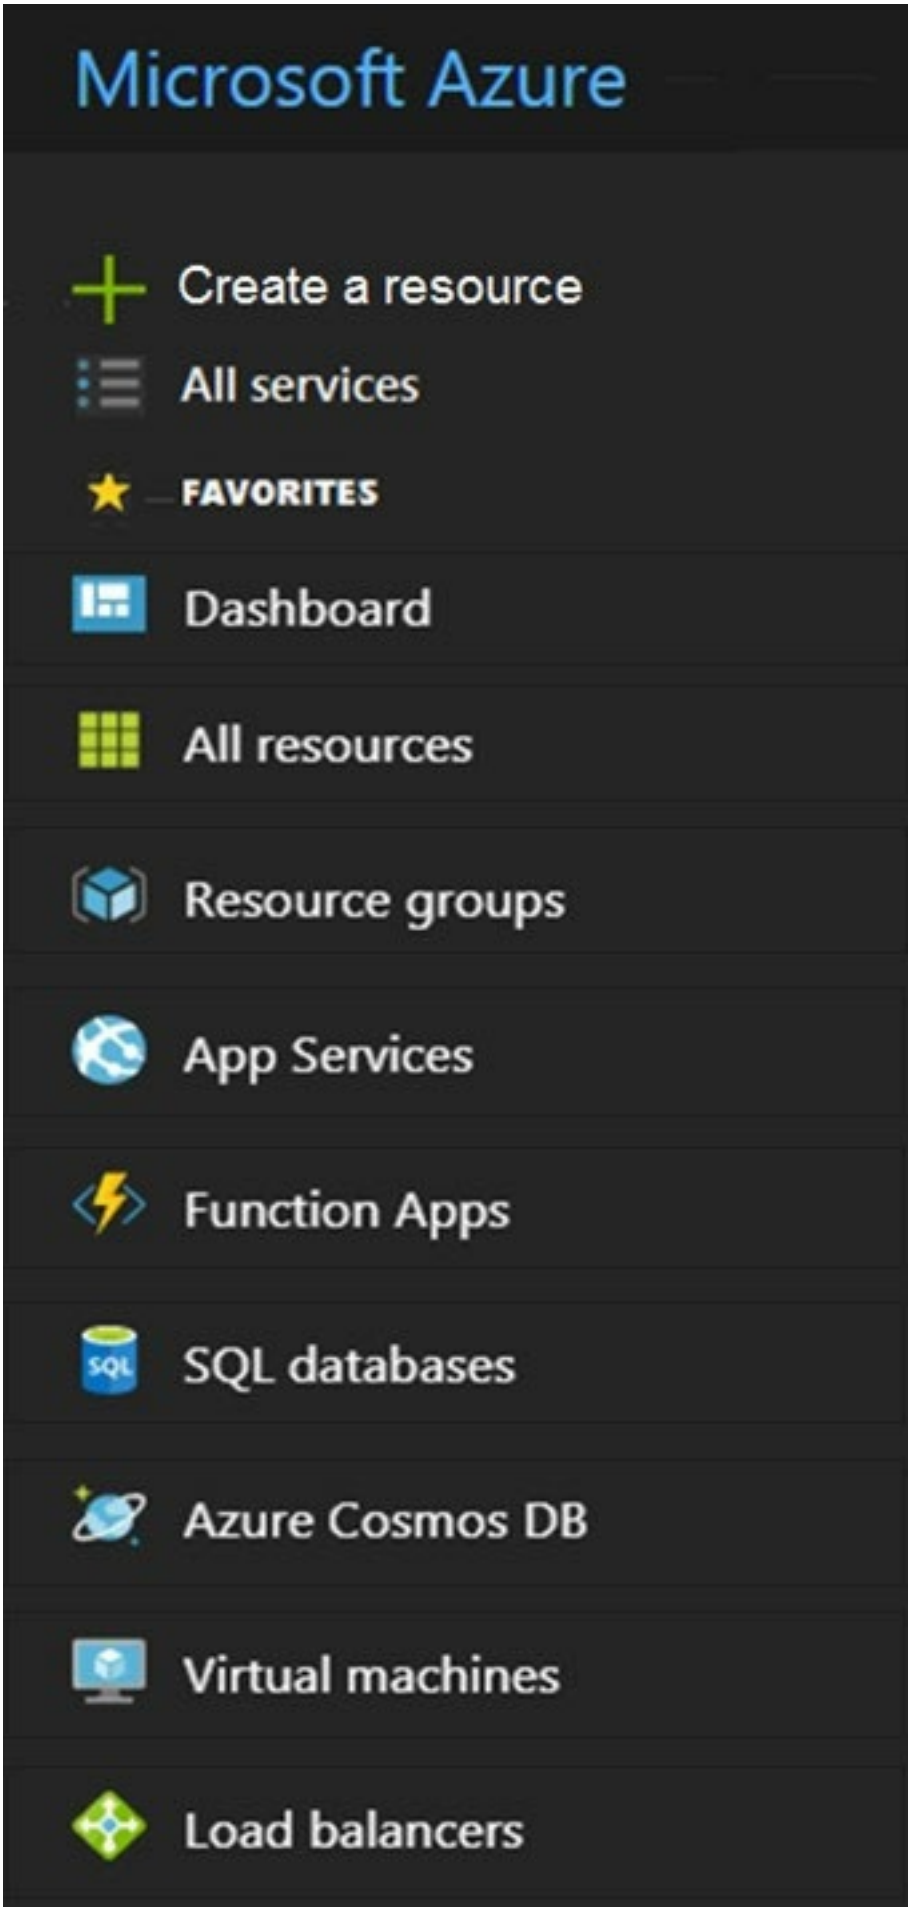
Answer: B

Explanation:
For products governed by the Modern Lifecycle Policy, Microsoft will provide a minimum of 12 months' notification prior to ending support if no successor product or service is offered " excluding free services or preview releases.

Reference:
https://support.microsoft.com/en-us/help/30881/modern-lifecycle-policy

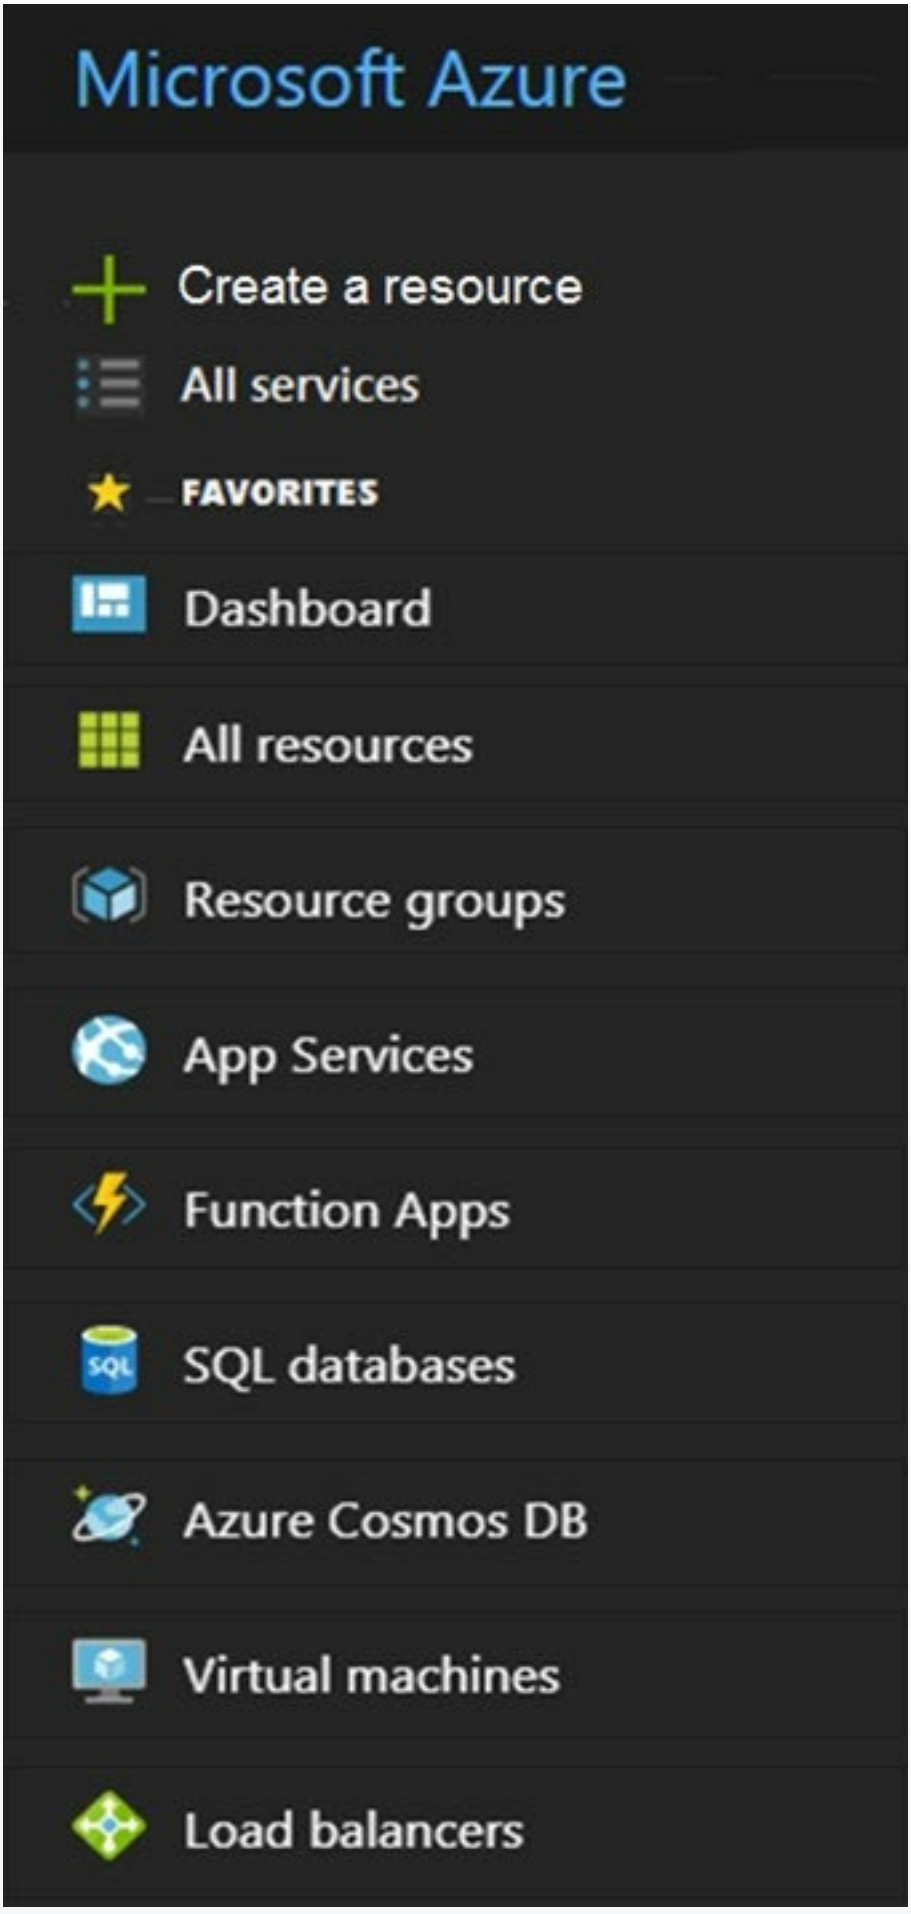
Question: 328 CertyIQ

HOTSPOT -
You need to request that Microsoft increase a subscription quota limit for your company.
Which blade should you use from the Azure portal? To answer, select the appropriate blade in the answer area.
Hot Area:



Microsoft Azure
Create a resource
All services
FAVORITES
Dashboard
All resources
Resource groups
App Services
Function Apps
SQL databases
Azure Cosmos DB
Virtual machines
Load balancers

Answer:



Explanation:

Request a standard quota increase from Help + support

Reference:

https://docs.microsoft.com/en-us/azure/azure-portal/supportability/per-vm-quota-requests

Question: 329 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:
Answer Area

You can use [ ] in Azure to send email alerts when the cost of the current billing period for an Azure subscription exceeds a specified limit.

- Advisor recommendations
- Access control (IAM)
- Budget alerts
- Compliance

Answer:

Answer Area

You can use [Budget alerts] in Azure to send email alerts when the cost of the current billing period for an Azure subscription exceeds a specified limit.

Explanation:
Budget alerts notify you when spending, based on usage or cost, reaches or exceeds the amount defined in the alert condition of the budget. Cost Management budgets are created using the Azure portal or the Azure Consumption API.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/costs/cost-mgt-alerts-monitor-usage-spending

Question: 330 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
From the Azure portal, you can distinguish between services that are generally available and services that are in public preview.	○	○
After an Azure service becomes generally available, the service is no longer updated with new features.	○	○
When you create Azure resources for a service in public preview, you must recreate the resources once the service becomes generally available.	○	○

Answer:

Answer Area

Statements	Yes	No
From the Azure portal, you can distinguish between services that are generally available and services that are in public preview.	○	○
After an Azure service becomes generally available, the service is no longer updated with new features.	○	○
When you create Azure resources for a service in public preview, you must recreate the resources once the service becomes generally available.	○	○

Explanation:

Reference:
https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms/

Question: 331

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
When using an Azure ExpressRoute connection, inbound data traffic from an on-premises network to Azure is always free.	○	○
Outbound data traffic from Azure to an on-premises network is always free.	○	○
Data traffic between Azure services within the same Azure region is always free.	○	○

Answer:

Answer Area

Statements	Yes	No
When using an Azure ExpressRoute connection, inbound data traffic from an on-premises network to Azure is always free.	○	○
Outbound data traffic from Azure to an on-premises network is always free.	○	○
Data traffic between Azure services within the same Azure region is always free.	○	○

Explanation:

Box 1: Yes -

With Azure ExpressRoute, all inbound data transfer is free of charge.

Box 2: No -

Inbound data traffic is free but outbound data traffic is not.

Box 3: Yes -

>>>>>>>>>>>>>>>>>>>>>>

1. Yes. You already use and pay ExpressRoute. They just ask if inbound data is free of charge, which it is.

2. No. Outbound data is not free of charge.

3. Yes. Within same region is free.

>>>>>>>>>>>>>>>>>.>>>>>

https://azure.microsoft.com/en-us/pricing/details/expressroute/ https://azure.microsoft.com/en-

us/pricing/details/bandwidth/

Question: 332 CertyIQ

Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Which unused resources should you remove?

A. the network interfaces
B. the public IP addresses
C. the groups
D. the user accounts

Answer: B

Explanation:
You are charged for public IP addresses. Therefore, deleting unused public IP addresses will reduce the Azure costs.

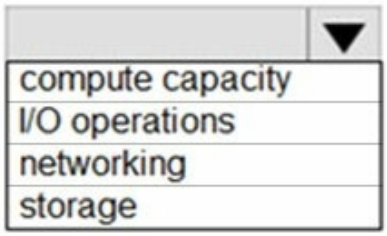
Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 333 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

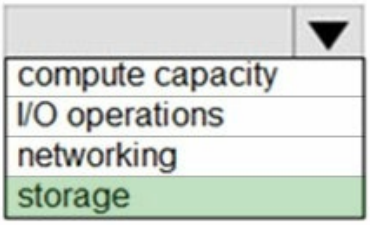
If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for



Answer:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for



Explanation:
When a virtual machine is stopped (deallocated), the virtual machine is unloaded/dismounted from the physical server in Azure. In this state, you are not charged for the virtual machine itself. However, you are still charged for the storage costs of the virtual hard disks attached to the virtual machine.
If the virtual machine is stopped but not deallocated (this happens if you shut down the virtual machine from the operating system of the virtual machine), the virtual machine is still mounted on the physical server in Azure and you are charged for the virtual machine itself as well as the storage costs. To ensure that a virtual machine is 'stopped (deallocated)', you need to stop the virtual machine in the Azure portal.

Reference:
https://blogs.technet.microsoft.com/uspartner_ts2team/2014/10/10/azure-virtual-machines-stopping-versus-stopping-deallocating/

Question: 334 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statements	Yes	No
Storing 1 TB of data in Azure Blob storage will always cost the same, regardless of the Azure region in which the data is located.	○	○
When you use a general-purpose v2 Azure Storage account, you are only charged for the amount of data that is stored. All read and write operations are free.	○	○
Transferring data between Azure Storage accounts in different Azure regions is free.	○	○

Answer:

Statements	Yes	No
Storing 1 TB of data in Azure Blob storage will always cost the same, regardless of the Azure region in which the data is located.	○	○
When you use a general-purpose v2 Azure Storage account, you are only charged for the amount of data that is stored. All read and write operations are free.	○	○
Transferring data between Azure Storage accounts in different Azure regions is free.	○	○

Explanation:

Inbound is free.

Outbound is paid per GB.

Storage rent is paid per GB/month.

Storage read/write operations are paid.

Box 1: No -

The price of Azure storage varies by region. If you use the Azure storage pricing page, you can select different regions and see how the price changes per region.

Box 2: No -

You are charged for read and write operations in general-purpose v2 storage accounts.

Box 3: No -

You would be charge for the read operations of the source storage account and write operations in the destination storage account.

Reference:

https://docs.microsoft.com/en-us/azure/storage/common/storage-account-overview
https://azure.microsoft.com/en-gb/pricing/details/storage/blobs/

Question: 335

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
In Azure Active Directory Premium P2, at least 99.9 percent availability is guaranteed.	○	○
The Service Level Agreement (SLA) for Azure Active Directory Premium P2 is the same as the SLA for Azure Active Directory Free.	○	○
All paying Azure customers receive a credit if their monthly uptime percentage is below the guaranteed amount in the Service Level Agreement (SLA).	○	○

Answer:

Answer Area

Statements	Yes	No
In Azure Active Directory Premium P2, at least 99.9 percent availability is guaranteed.	○	○
The Service Level Agreement (SLA) for Azure Active Directory Premium P2 is the same as the SLA for Azure Active Directory Free.	○	○
All paying Azure customers receive a credit if their monthly uptime percentage is below the guaranteed amount in the Service Level Agreement (SLA).	○	○

Explanation:
Box 1: Yes -

Microsoft guarantee at least 99.9% availability of the Azure Active Directory Premium edition services. The services are considered available in the following scenarios:
➩ Users are able to login to the service, login to the Access Panel, access applications on the Access Panel and reset passwords.
➩ IT administrators are able to create, read, write and delete entries in the directory or provision or de-provision users to applications in the directory.

Box 2: No -
No SLA is provided for the Free tier of Azure Active Directory.

Box 3: Yes -
You can claim credit if the availability falls below the SLA. The amount of credit depends on the availability. For example: You can claim 25% credit if the availability is less than 99.9%, 50% credit for less than 99% and 100% for less than 95% availability.

Reference:
https://azure.microsoft.com/en-gb/support/legal/sla/active-directory/v1_0/

Question: 336 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Adding resource groups in an Azure subscription generates additional costs.	○	○
Copying 10 GB of data **to** Azure **from** an on-premises network over a VPN generates additional Azure data transfer costs.	○	○
Copying 10 GB of data **from** Azure **to** an on-premises network over a VPN generates additional Azure data transfer costs.	○	○

Answer:

Answer Area

Statements	Yes	No
Adding resource groups in an Azure subscription generates additional costs.	○	●
Copying 10 GB of data **to** Azure **from** an on-premises network over a VPN generates additional Azure data transfer costs.	○	●
Copying 10 GB of data **from** Azure **to** an on-premises network over a VPN generates additional Azure data transfer costs.	●	○

Explanation:
Box 1: No -
Resource groups are logical containers for Azure resources. You do not pay for resource groups.

Box 2: No -
Data ingress over a VPN is data 'coming in' to Azure over the VPN. You are not charged data transfer costs for data ingress.

Box 3: Yes -
Data egress over a VPN is data 'going out' of Azure over the VPN. You are charged for data egress.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/manage-resource-groups-portal
https://azure.microsoft.com/en-us/pricing/details/bandwidth/

Question: 337 CertyIQ

Who can use the Azure Total Cost of Ownership (TCO) calculator?

A. billing readers for an Azure subscription only

B. owners for an Azure subscription only

C. anyone

D. all users who have an account in Azure Active Directory (Azure AD) that is linked to an Azure subscription only

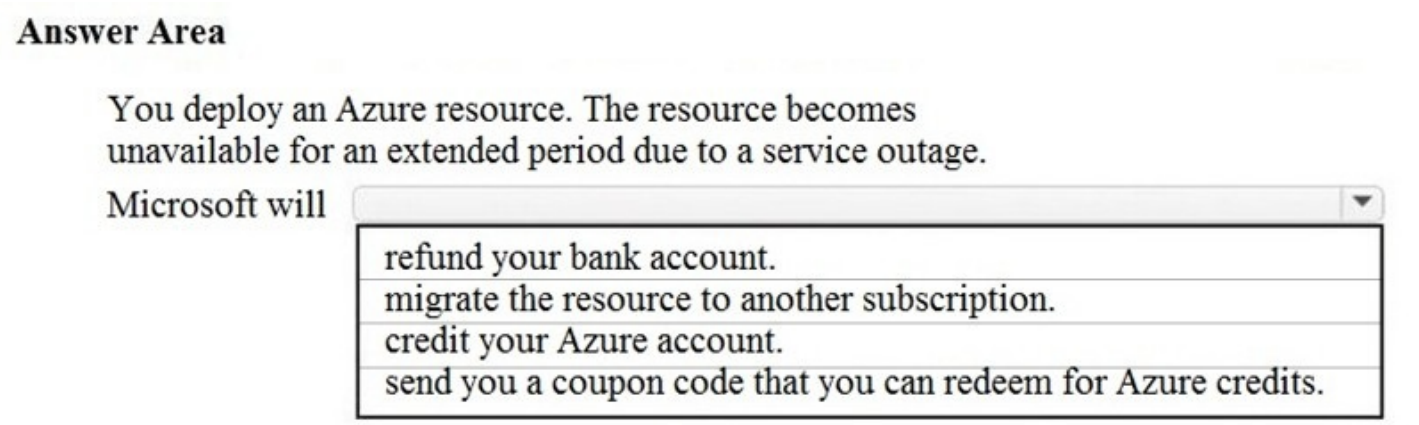
Answer: C

Explanation:
You don't need an Azure subscription to work with the TCO Calculator.

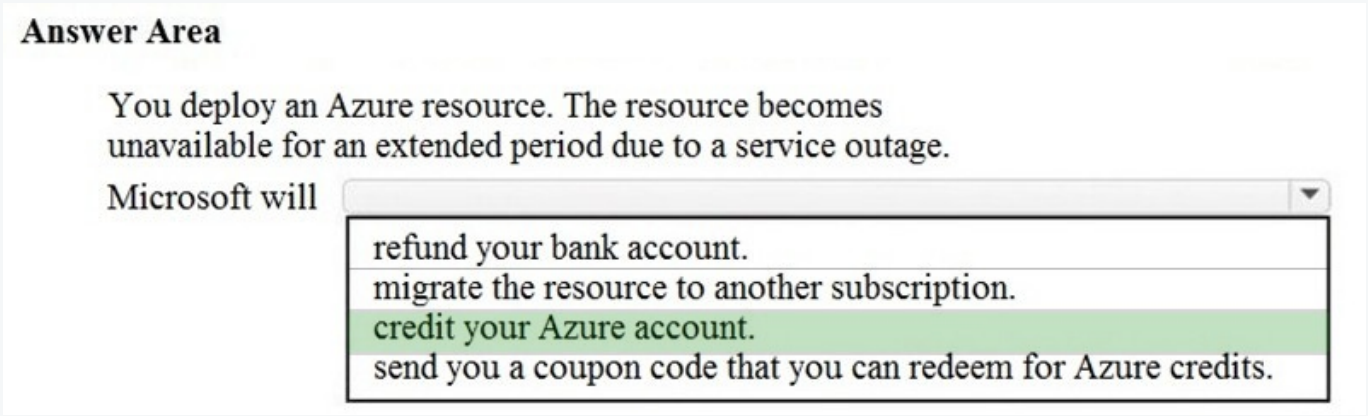
Reference:
https://docs.microsoft.com/en-us/learn/modules/plan-manage-azure-costs/2-compare-costs-tco-calculator

Question: 338 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



Explanation:
If the SLA for an Azure service is not met, you receive credits for that service and that service only. The credits are deducted from your monthly bill for that service.
If you stopped using the service where the SLA was not met, your account would remain in credit for that service. The credits would not be applied to any other services that you may be using.
Service Credits apply only to fees paid for the particular Service, Service Resource, or Service tier for which a Service Level has not been met. In cases where
Service Levels apply to individual Service Resources or to separate Service tiers, Service Credits apply only to fees paid for the affected Service Resource or
Service tier, as applicable. The Service Credits awarded in any billing month for a particular Service or Service Resource will not, under any circumstance, exceed your monthly service fees for that Service or Service Resource, as applicable, in the billing month.

Question: 339 CertyIQ

Which task can you perform by using Azure Advisor?

A. Integrate Active Directory and Azure Active Directory (Azure AD).
B. Estimate the costs of an Azure solution.
C. Confirm that Azure subscription security follows best practices.
D. Evaluate which on-premises resources can be migrated to Azure.

Answer: C

Explanation:

Price estimation is provided by pricing calculator

Advisor provides relevant best practices to help you improve reliability, security, and performance, achieve operational excellence, and reduce costs. Configure Advisor to target specific subscriptions and resource groups, to focus on critical optimisations. Access Advisor through the Azure portal, the Azure Command Line Interface (CLI), or the Advisor API. Or configure alerts to notify you automatically about new recommendations.

Question: 340

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
If your company uses an Azure free account, you will only be able to use a subset of Azure services.	○	○
All Azure free accounts expire after a specific period.	○	○
You can create up to 10 Azure free accounts by using the same Microsoft account.	○	○

Answer:

Answer Area

Statements	Yes	No
If your company uses an Azure free account, you will only be able to use a subset of Azure services.	○	○
All Azure free accounts expire after a specific period.	○	○
You can create up to 10 Azure free accounts by using the same Microsoft account.	○	○

Explanation:

Box 1: Yes

Box 2: Yes -

All free accounts expire after 12 months.

Box 3: No -

You can only create one free Azure account per Microsoft account.

Reference:

https://azure.microsoft.com/en-us/free/free-account-faq/

Question: 341 CertyIQ

You have an Azure application that uses the services shown in the following table.

Service	Service Level Agreement (SLA)
Azure virtual machines	99.9%
Azure SQL Database	99.99%

How should you calculate the composite SLA for the application?

A. 0.999 * 0.9999 = 0.9989001 = 99.89001%
B. 0.999 / 0.9999 = 0.9991 = 99.91%
C. Max(0.999, 0.9999) = 0.9999 = 99.99%
D. Min(0.999, 0.9999) = 0.999 = 99.9%

Answer:

A

Explanation:

Composite SLAs involve multiple services supporting an application, each with differing levels of availability. For example, consider an App Service web app that writes to Azure SQL Database. At the time of this writing, these Azure services have the following SLAs:

✑ App Service web apps = 99.95%

✑ SQL Database = 99.99%

What is the maximum downtime you would expect for this application? If either service fails, the whole application fails. The probability of each service failing is independent, so the composite SLA for this application is 99.95% — 99.99% = 99.94%. That's lower than the individual SLAs, which isn't surprising because an application that relies on multiple services has more potential failure points.

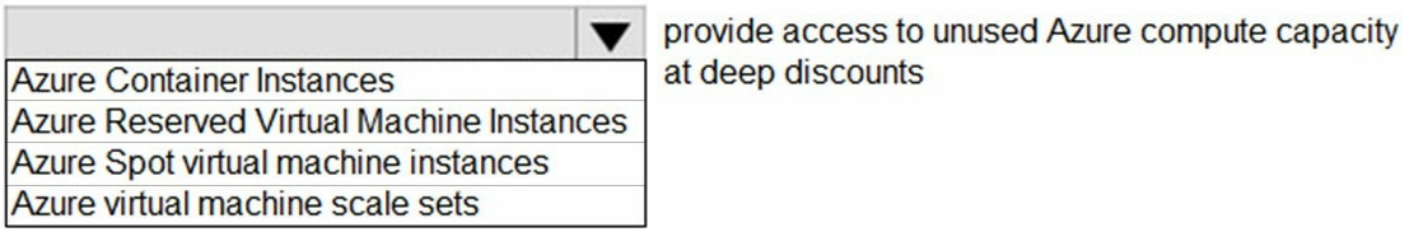
https://docs.microsoft.com/en-us/azure/architecture/reliability/requirements#understand-service-level-agreements

Question: 342 CertyIQ

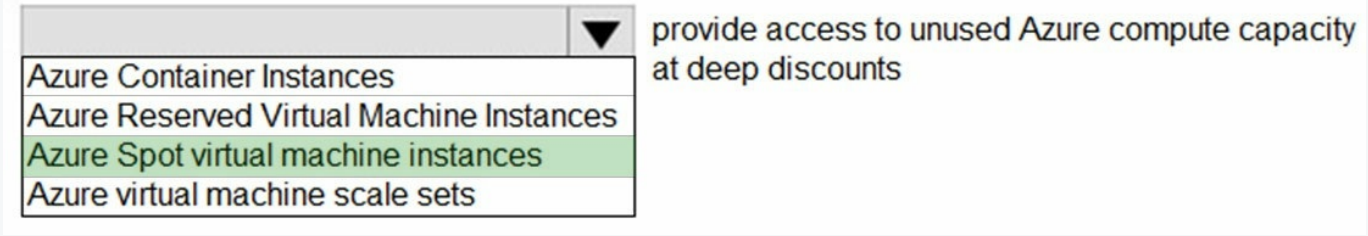
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

"Azure Spot VM instances" is the answer.

https://learn.microsoft.com/en-us/azure/virtual-machines/spot-vms

Using Azure Spot Virtual Machines allows you to take advantage of our unused capacity at a significant cost savings. At any point in time when Azure needs the capacity back, the Azure infrastructure will evict Azure Spot Virtual Machines. Therefore, Azure Spot Virtual Machines are great for workloads that can handle interruptions like batch processing jobs, dev/test environments, large compute workloads, and more.

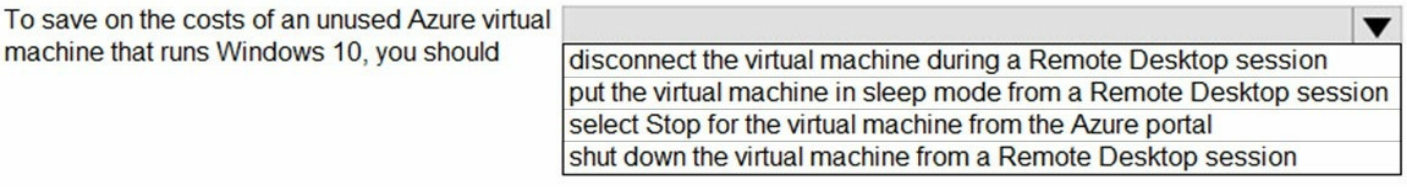
Reference:

https://docs.microsoft.com/en-us/shows/azure-videos/virtual-spot-machines-overview

Question: 343 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area

To save on the costs of an unused Azure virtual machine that runs Windows 10, you should

- disconnect the virtual machine during a Remote Desktop session
- put the virtual machine in sleep mode from a Remote Desktop session
- select Stop for the virtual machine from the Azure portal
- shut down the virtual machine from a Remote Desktop session

Explanation:

Select stop for the Virtual machine from the Azure portal.

Shutting down the machine from the OS is not enough, you will still be paying for the Azure VM compute resources (aka hardware allocation).

Question: 344

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

All Azure services that are in public preview are

- provided without any documentation.
- only configurable from Azure CLI.
- excluded from the Service Level Agreements.
- only configurable from the Azure portal.

Answer:

Answer Area

All Azure services that are in public preview are

- provided without any documentation.
- only configurable from Azure CLI.
- excluded from the Service Level Agreements.
- only configurable from the Azure portal.

Explanation:

"excluded from SLA" is the answer.

https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms

Public preview – During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal

service level agreements do not apply.

Public preview " During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply.

Reference:

https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms
https://azure.microsoft.com/en-us/overview/what-is-saas/

Question: 345 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for

- compute capacity
- I/O operations
- networking
- storage

Answer:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for

- compute capacity
- I/O operations
- networking
- storage

Explanation:
Box: storage -
Azure doesn't charge for the VM core hours while it is Stopped (Deallocated). However, you continue to accrue charges for the Azure storage needed for the VM's
OS disk and any attached data disks.

Reference:
https://www.parkmycloud.com/does-azure-charge-for-stopped-vm/

Question: 346 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

The [ ] explains what data Microsoft processes, how Microsoft processes the data, and the purpose of processing the data.

- Microsoft Online Services Privacy Statement
- Microsoft Product Terms
- Microsoft Online Service Level Agreement
- Online Subscription Agreement for Microsoft Azure

Answer:

Answer Area

The [Microsoft Online Services Privacy Statement] explains what data Microsoft processes, how Microsoft processes the data, and the purpose of processing the data.

Explanation:
Box: Microsoft Online Services Privacy Statement

Microsoft Privacy Statement -
Your privacy is important to us. This privacy statement explains the personal data Microsoft processes, how Microsoft processes it, and for what purposes.

Reference:
https://privacy.microsoft.com/en-us/privacystatement

Question: 347 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can access Compliance Manager from the [ ]

- Azure Active Directory admin center
- Azure portal
- Microsoft 365 admin center
- Microsoft Service Trust Portal

Answer:

Answer Area

You can access Compliance Manager from the

- Azure Active Directory admin center
- Azure portal
- **Microsoft 365 admin center**
- Microsoft Service Trust Portal

Explanation:

Box: Microsoft 365 admin center -

1. Go to the Microsoft 365 compliance center and sign in with your Microsoft 365 global administrator account.

2. Select Compliance Manager on the left navigation pane. You'll arrive at your Compliance Manager dashboard.

Note:- Compliance Manager has moved from the Service Trust Portal to the Microsoft Purview compliance portal.

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/compliance-manager-setup

Question: 348 CertyIQ

You have 1,000 virtual machines hosted on the Hyper-V hosts in a data center.
You plan to migrate all the virtual machines to an Azure pay-as-you-go subscription.
You need to identify which expenditure model to use for the planned Azure solution.
Which expenditure model should you identify?

A. scalable
B. operational
C. elastic
D. capital

Answer: B

Explanation:
One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it). This switch also requires more careful management of your costs. The benefit of the cloud is that you can fundamentally and positively affect the cost of a service you use by merely shutting down or resizing it when it's not needed.

Reference:
https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold

Question: 349 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

[▼] is an Apache Spark-based analytics service.

- Azure Databricks
- Azure Data Factory
- Azure DevOps
- Azure Synapse Analytics

Answer:

Answer Area

[▼] is an Apache Spark-based analytics service.

- Azure Databricks
- Azure Data Factory
- Azure DevOps
- Azure Synapse Analytics

Question: 350 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A company has complete control of the resources and security for its private cloud.	○	○
A hybrid cloud solution enables a company to control whether its applications run on-premises or in the cloud.	○	○
Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud.	○	○

Answer:

Answer Area

Statements	Yes	No
A company has complete control of the resources and security for its private cloud.	○	○
A hybrid cloud solution enables a company to control whether its applications run on-premises or in the cloud.	○	○
Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud.	○	○

Explanation:

A company has complete control of the resources and security for its private cloud - **Yes**

A Hybrid Cloud solution enables a company to control whether its applications run on-premises or in the cloud - **Yes**

Explanation: Hybrid cloud computing enables an enterprise to deploy its most sensitive workloads in an on-premises cloud and to host less-critical resources on a third-party public cloud provider. This approach allows organizations to get the best of both private and public cloud models.

Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud - **No**

Explanation: With the public cloud, you get pay-as-you-go pricing – you pay only for what you use, no CapEx costs.

Question: 351 CertyIQ

Which Service Level Agreement (SLA) is provided for Azure services in public preview?

A. Each service defines its own SLA
B. The SLA will be 99%
C. The SLA will be 1% less than the general availability (GA) SLA
D. The SLA will be 99.95%

Answer: A

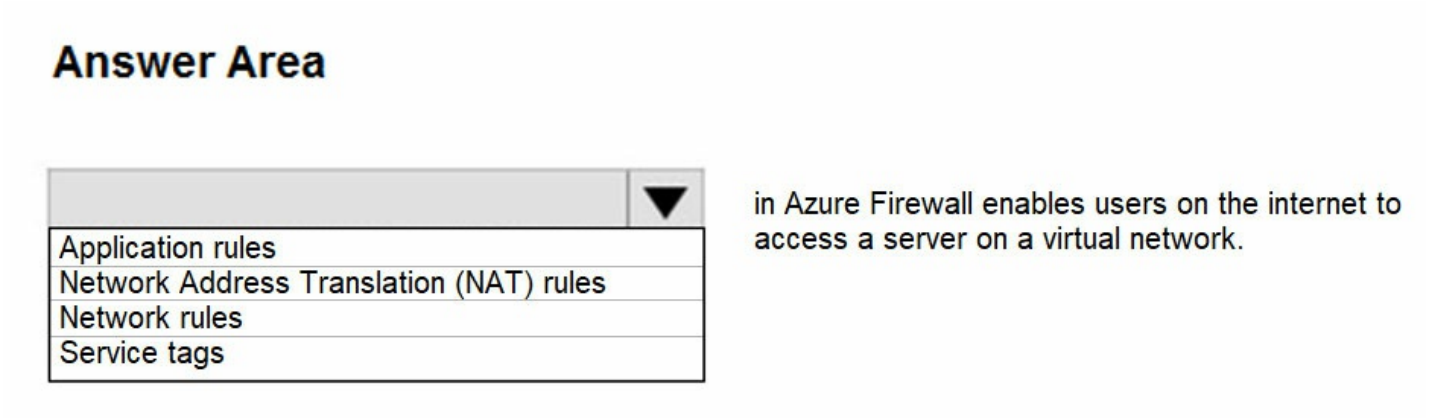
Explanation:

Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply

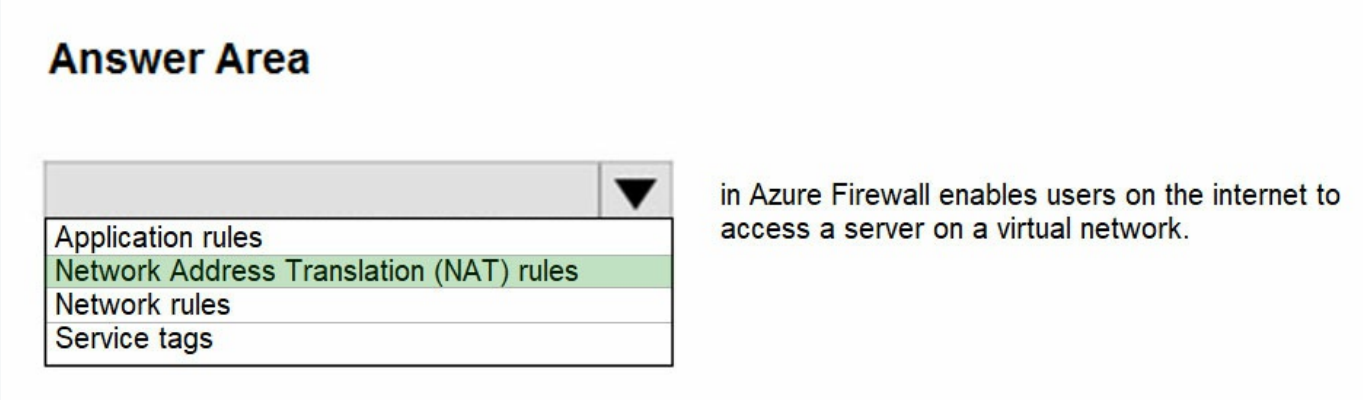
https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms/#:~:text=Public%20preview%20%E2%80%93%20During%20this%20phase%20we%20allow%20any%20cu

Question: 352 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:

"NAT rules" is the answer.

https://learn.microsoft.com/en-us/azure/firewall/policy-rule-sets#dnat-rules

DNAT rules allow or deny inbound traffic through the firewall public IP address(es). You can use a DNAT rule when you want a public IP address to be translated into a private IP address. The Azure Firewall public IP addresses can be used to listen to inbound traffic from the Internet, filter the traffic and translate this traffic to internal resources in Azure.

Question: 353

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The cost of outbound traffic from Azure is the same for all Azure regions.	○	○
Purchasing Azure services through an Enterprise Agreement (EA) requires you to spend a predetermined amount.	○	○
Microsoft defines the pricing structure of all third-party services sold through Azure Marketplace.	○	○

Answer:

Answer Area

Statements	Yes	No
The cost of outbound traffic from Azure is the same for all Azure regions.	○	○
Purchasing Azure services through an Enterprise Agreement (EA) requires you to spend a predetermined amount.	○	○
Microsoft defines the pricing structure of all third-party services sold through Azure Marketplace.	○	○

Explanation:

Box 1: No -

Within most of the areas, there are clearly more expensive regions and less expensive regions.

The least expensive regions, on average across these instance types are us-west-2, us-west-central, and korea-south.

The most expensive regions are asia-pacific-east, japan-east, and australia-east.

Box 2: Yes -

Many organizations with Microsoft Enterprise Agreements (EA) are adding Azure to their EA to enjoy the benefits it offers, such as:

Minimizing Azure upfront costs by locking in pricing with consumption pre-commitment

Using Azure EA Portal to manage Azure Subscriptions easily and organize them under a single billing account

Box 3: No

The commercial marketplace operates on an agency model, whereby publishers set prices, Microsoft bills customers, and Microsoft pays revenue to publishers while withholding an agency fee.

Question: 354

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Pay-As-You-Go (PAYG) is a consumption-based model.	○	○
Payments to cloud service providers are considered capital expenditures (CapEx).	○	○
The services provided through a consumption-based model are considered operational expenditures (OpEx).	○	○

Answer:

Answer Area

Statements	Yes	No
Pay-As-You-Go (PAYG) is a consumption-based model.	○	○
Payments to cloud service providers are considered capital expenditures (CapEx).	○	○
The services provided through a consumption-based model are considered operational expenditures (OpEx).	○	○

Explanation:
Box 1: Yes -
The Pay as You Go model is billed on a per second basis and you can start or stop the service at any time " paying only for what you use.

Box 2: No -
No, it is OpEx (Operational Expenditures).
OpEx: The business can achieve ROI immediately in many cases because the infrastructure is managed by the cloud provider.
CapEx: ROI is not usually realized until a long time after the purchase was made because the infrastructure needs to be set up and employees need to be trained.
Computers, servers, and other hardware needed for on-premises data centers are all examples of CapEx.

Box 3: Yes -
Operational Expenditures (OpEx) are the ongoing costs related to day-to-day operations. A subscription fee for cloud services is considered OpEx"the cloud provider is making the infrastructure investment upfront, and you only pay for the resources you need as you need them.

Reference:
https://azure.microsoft.com/en-us/pricing/purchase-options/pay-as-you-go/
https://blogs.vmware.com/cloudhealth/capex-vs-opex-cloud-cost-management/

Question: 355 CertyIQ

What is the longest term you can purchase for Azure Reserved VM instances?

A. one year
B. five years
C. four years
D. three years

Answer: D

Explanation:
Azure Reservations help you save money by committing to one-year or three-year plans for multiple products. Committing allows you to get a discount on the resources you use. Reservations can significantly reduce your resource costs by up to 72% from pay-as-you-go prices.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/reservations/save-compute-costs-reservations

Question: 356

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
All Azure services in private preview must be accessed by using a separate Azure portal.	○	○
Azure services in public preview can be used in production environments.	○	○
Azure services in public preview are subject to a Service Level Agreement (SLA).	○	○

Answer:

Answer Area

Statements	Yes	No
All Azure services in private preview must be accessed by using a separate Azure portal.	○	○
Azure services in public preview can be used in production environments.	○	○
Azure services in public preview are subject to a Service Level Agreement (SLA).	○	○

Explanation:
Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Box 1: No -
Services in private preview can be viewed in the regular Azure portal. However, you need to be signed up for the feature in private preview before you can view it.
Access to private preview features is usually by invitation only.

Box 2: Yes -
You can use services in public preview in production environments. However, you should be aware that the service may have faults, is not subject to an SLA and may be withdrawn without notice.

Box 3: No -
Public previews are excluded from SLAs and in some cases, no support is offered.

Reference:
https://www.neowin.net/news/several-more-azure-services-now-available-in-private-public-preview/

Question: 357

CertyIQ

Your company has 10 offices. You plan to generate several billing reports from the Azure portal. Each report will contain the Azure resource utilization of each office.
Which Azure Resource Manager feature should you use before you generate the reports?

A. tags
B. templates
C. locks
D. policies

Answer: A

Explanation:
You can use resource tags to 'label' Azure resources. Tags are metadata elements attached to resources. Tags consist of pairs of key/value strings. In this question, we would tag each resource with a tag to identify each office. For example: Location = Office1. When all Azure resources are tagged, you can generate reports to list all resources based on the value of the tag. For example: All resources used by Office1.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/decision-guides/resource-tagging/

Question: 358

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A Standard support plan is included in an Azure free account.	○	○
A Premier support plan can only be purchased by companies that have an Enterprise Agreement (EA).	○	○
Support from MSDN forums is only provided to companies that have a pay-as-you-go subscription.	○	○

Answer:

Answer Area

Statements	Yes	No
A Standard support plan is included in an Azure free account.	○	●
A Premier support plan can only be purchased by companies that have an Enterprise Agreement (EA).	●	○
Support from MSDN forums is only provided to companies that have a pay-as-you-go subscription.	○	●

Explanation:

Box 1: No -

An Azure free account comes with a 'basic' support plan, not a 'standard' support plan.

Box 2: Yes -

You can purchase the Professional Direct, Standard, and Developer support plans with the Microsoft

Customer Agreement. You can also purchase the

Professional and Standard support plans with the Enterprise Agreement.

Box 3: No -

Users with any type of Azure subscription (pay-as-you-go, Enterprise Agreement, Microsoft Customer Agreement etc.) can get support from the MSDN forums.

References:

https://azure.microsoft.com/en-us/support/plans/

Question: 359 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
If Microsoft plans to end support for an Azure service that does NOT have a successor service, Microsoft will provide notification at least 12 months before.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed.
B. 6 months
C. 90 days
D. 30 days

Answer: A

Explanation:
The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For products governed by the Modern Lifecycle Policy,
Microsoft will provide a minimum of 12 months' notification prior to ending support if no successor product or service is offered"excluding free services or preview releases.

Reference:
https://support.microsoft.com/en-us/help/30881

Question: 360 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
A user who is assigned the Owner role can transfer ownership of an Azure subscription.	○	○
You can convert the Azure subscription of your company from Free Trial to Pay-As-You-Go.	○	○
The Azure spending limit is fixed and cannot be increased or decreased.	○	○

Answer:

Answer Area

Statements	Yes	No
A user who is assigned the Owner role can transfer ownership of an Azure subscription.	○	○
You can convert the Azure subscription of your company from Free Trial to Pay-As-You-Go.	○	○
The Azure spending limit is fixed and cannot be increased or decreased.	○	○

Explanation:

Box 1: No -

You need to be an administrator of the billing account that has the subscription to be able to transfer the subscription. This could be a Billing Administrator or

Global Administrator. A subscription owner can manage all resources and permissions within the subscription but cannot transfer ownership of the subscription.

Box 2: Yes -

You can convert a free trial subscription to Pay-As-You-Go. This is common practice for people who wish to continue using the Azure services when the free trial period expires.

Box 3: Yes -

You can remove the spending limit, but you can't increase or decrease it.

The spending limit in Azure prevents spending over your credit amount. All new customers who sign up for an Azure free account or subscription types that include credits over multiple months have the spending limit turned on by default. The spending limit is equal to the amount of credit and it can't be changed. For example, if you signed up for Azure free account, your spending limit is $200 and you can't change it to $500. However, you can remove the spending limit. So, you either have no limit, or you have a limit equal to the amount of

credit.

Reference:

https://docs.microsoft.com/en-us/azure/billing/billing-add-change-azure-subscription-administrator
https://docs.microsoft.com/en-us/azure/billing/billing-upgrade-azure-subscription
https://docs.microsoft.com/en-us/azure/billing/billing-spending-limit

Question: 361 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Answer Area

Statements	Yes	No
With Azure Reservations, you pay less for virtual machines than with pay-as-you-go pricing.	○	○
Two Azure virtual machines that use the B2S size have the same monthly costs.	○	○
When an Azure virtual machine is stopped, you continue to pay storage costs for the virtual machine.	○	○

Answer:

Answer Area

Statements	Yes	No
With Azure Reservations, you pay less for virtual machines than with pay-as-you-go pricing.	○	○
Two Azure virtual machines that use the B2S size have the same monthly costs.	○	○
When an Azure virtual machine is stopped, you continue to pay storage costs for the virtual machine.	○	○

Explanation:
Box 1: Yes -
A reservation is where you commit to pay for a resource (for example a virtual machine) for one or three years. This gives you a discounted price on the resource for the reservation period.

Box 2: No -
There are other factors that influence the cost of a virtual machine such as the virtual hard disks attached to the virtual machine. You could have multiple virtual machines with the same 'size' (B2S in this case) but with different virtual hard disk configurations.

Box 3: Yes -
When a virtual machine is stopped (deallocated), the virtual machine is unloaded/dismounted from the physical server in Azure. In this state, you are not charged for the virtual machine itself. However, you are still charged for the storage costs of the virtual hard disks attached to the virtual machine.
If the virtual machine is stopped but not deallocated (this happens if you shut down the virtual machine from the operating system of the virtual machine), the virtual machine is still mounted on the physical server in Azure and you are charged for the virtual machine itself as well as the storage costs. To ensure that a virtual machine is 'stopped (deallocated)', you need to stop the virtual machine in the Azure portal.

Question: 362 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused network interfaces.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
You are not charged for unused network interfaces. Therefore, deleting unused network interfaces will not reduce the Azure costs for the company.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 363 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)

Five groups in Azure AD -

- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused public IP addresses.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
You are charged for public IP addresses. Therefore, deleting unused public IP addresses will reduce the Azure costs.

Reference:

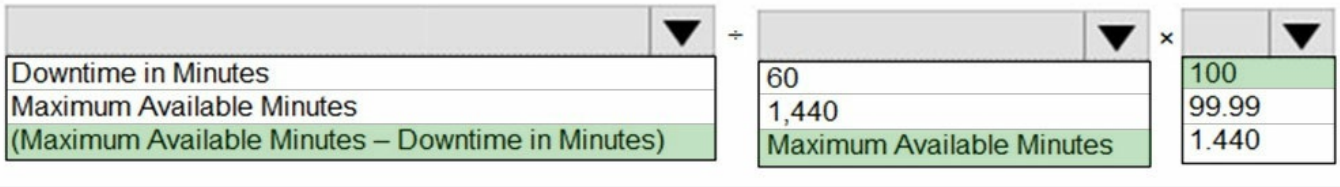
Question: 365 CertyIQ

HOTSPOT -
How should you calculate the monthly uptime percentage? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Answer:

Answer Area



Explanation:
"Maximum Available Minutes" is the total accumulated minutes during a billing month .
"Downtime" is the total accumulated minutes that are part of Maximum Available Minutes where a system is unavailable.
"Monthly Uptime Percentage" for a service is calculated as Maximum Available Minutes less Downtime divided by Maximum Available Minutes x 100.
Monthly Uptime Percentage is represented by the following formula:
Monthly Uptime % = (Maximum Available Minutes-Downtime) / Maximum Available Minutes x 100.

Reference:
https://azure.microsoft.com/en-au/support/legal/sla/cloud-services/v1_0/

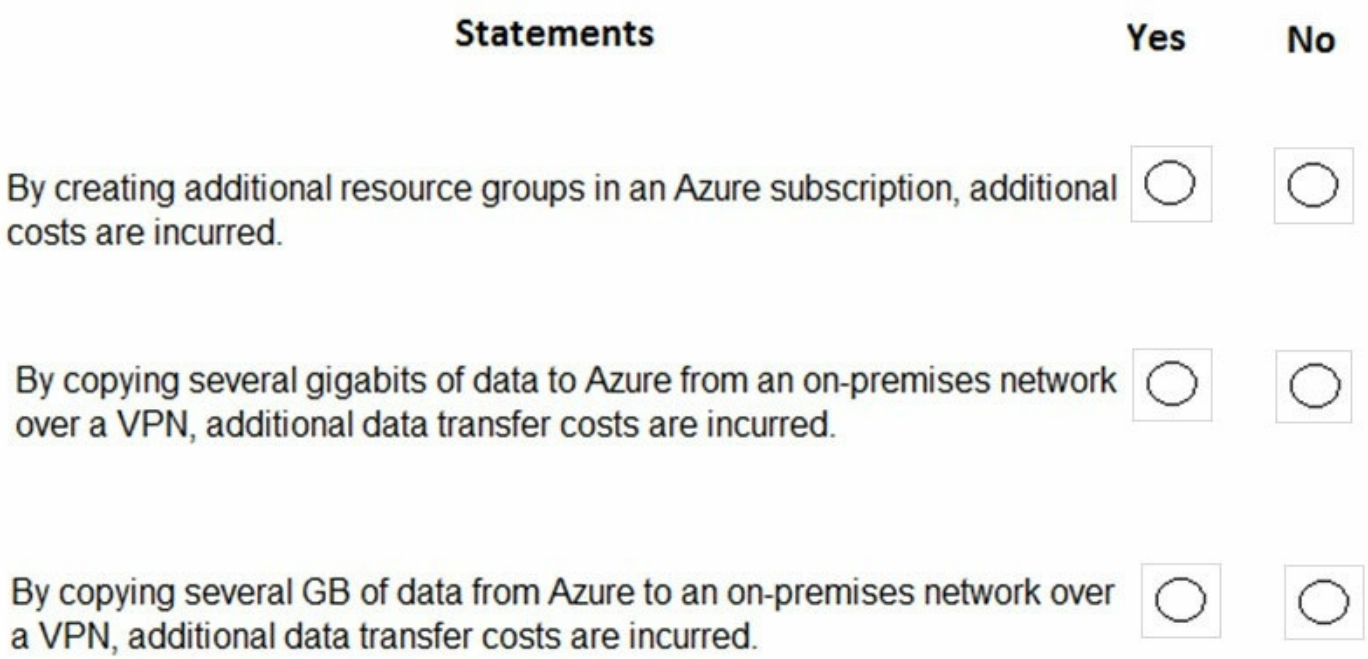
Answer Area



Answer:

Answer Area

Statements	Yes	No
By creating additional resource groups in an Azure subscription, additional costs are incurred.	○	○
By copying several gigabits of data to Azure from an on-premises network over a VPN, additional data transfer costs are incurred.	○	○
By copying several GB of data from Azure to an on-premises network over a VPN, additional data transfer costs are incurred.	○	○

Explanation:
Box 1: No -
Resource groups are logical containers for Azure resources. You do not pay for resource groups.

Box 2: No -
Data ingress over a VPN is data 'coming in' to Azure over the VPN. You are not charged data transfer costs for data ingress.

Box 3: Yes -
Data egress over a VPN is data 'going out' of Azure over the VPN. You are charged for data egress.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/manage-resource-groups-portal https://azure.microsoft.com/en-us/pricing/details/bandwidth/ https://azure.microsoft.com/en-us/pricing/details/bandwidth/

Question: 367 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
A support plan solution that gives you best practice information, health status and notifications, and 24/7 access to billing information at the lowest possible cost is a Standard support plan.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Developer
C. Basic
D. Premier

Answer: C

Explanation:
A basic support plan provides:

✑ 24x7 access to billing and subscription support, online self-help, documentation, whitepapers, and support forums
✑ Best practices: Access to full set of Azure Advisor recommendations
✑ Health Status and Notifications: Access to personalized Service Health Dashboard & Health API

Reference:
https://azure.microsoft.com/en-us/support/plans/

Question: 368 CertyIQ

In which Azure support plans can you open a new support request?

A. Premier and Professional Direct only
B. Premier, Professional Direct, and Standard only
C. Premier, Professional Direct, Standard, and Developer only
D. Premier, Professional Direct, Standard, Developer, and Basic

Answer: D

Explanation:

You can submit support request tickets in the following plans: Premier, Professional Direct, Standard, Developer, and Basic.

Reference:

https://azure.microsoft.com/en-us/support/plans/

Question: 369 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
You can create an Azure support request from support.microsoft.com.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed.` If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed.
B. the Azure portal
C. the Knowledge Center
D. the Security & Compliance admin center

Answer: B

Explanation:
You can create an Azure support request from the Help and Support blade in the Azure portal or from the context menu of an Azure resource in the Support + Troubleshooting section.

Reference:
https://docs.microsoft.com/en-us/azure/azure-supportability/how-to-create-azure-support-request

Question: 370 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused groups.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
You are not charged for Azure Active Directory Groups. Therefore, deleting unused groups will not reduce your Azure costs.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 371 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
The Azure Standard support plan is the lowest cost option to receive 24x7 access to support engineers by phone.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Developer
C. Basic
D. Professional Direct

Answer: A

Explanation:

The Basic support plan is free so is therefore the cheapest. The Developer support plan is the cheapest paid-for support plan. The order of support plans in terms of cost ranging from the cheapest to most expensive is: Basic, Developer, Standard, Professional Direct, Premier.

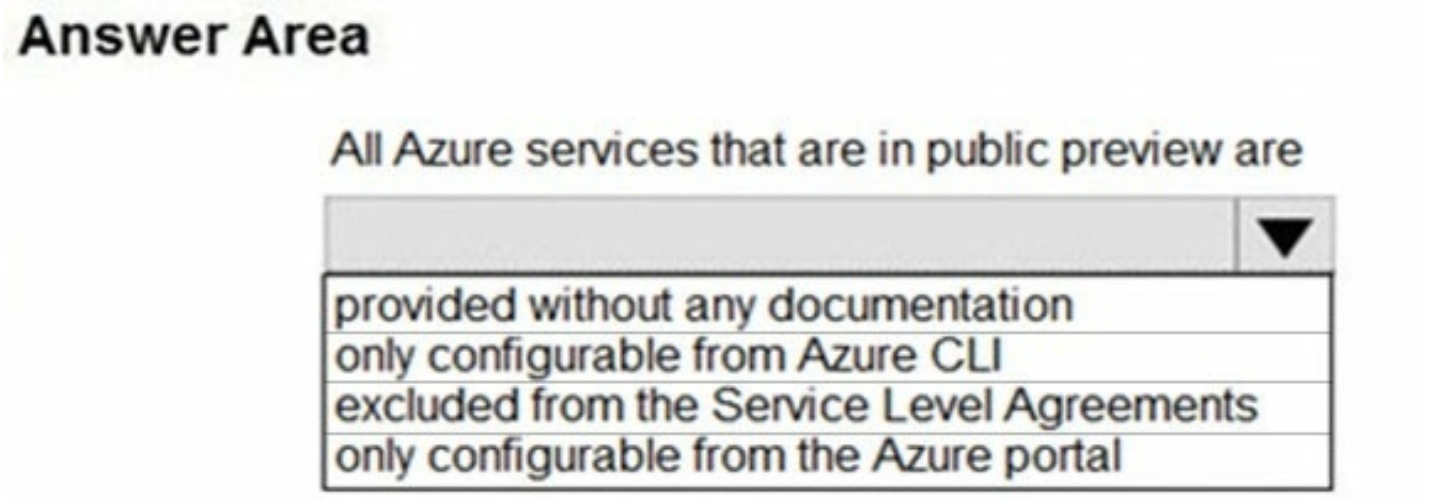
However, 24/7 access to technical support by email and phone is only available for Standard, Professional Direct, Premier plans.

Reference:

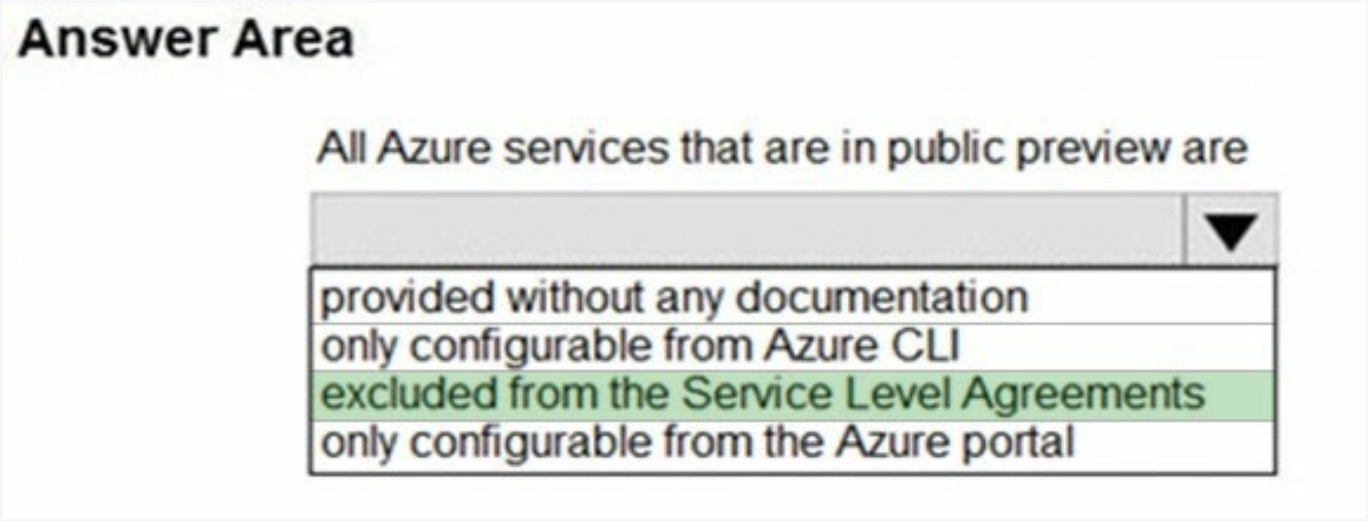
https://azure.microsoft.com/en-gb/support/plans/

Question: 372 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



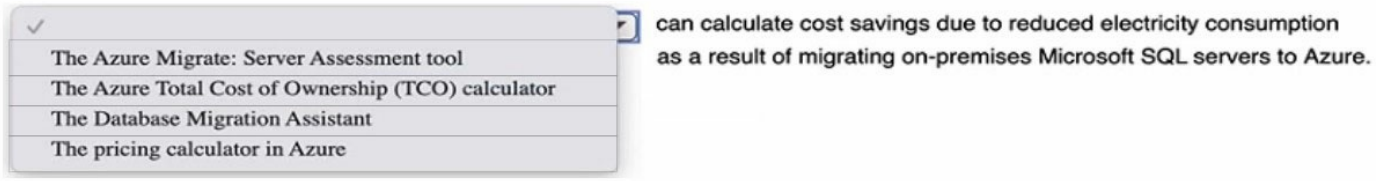
Explanation:
Preview features are made available to you on the condition that you accept additional terms which supplement the regular Azure terms. The supplemental terms state:
PREVIEWS ARE PROVIDED "AS-IS," "WITH ALL FAULTS," AND "AS AVAILABLE," AND ARE EXCLUDED FROM THE SERVICE LEVEL AGREEMENTS AND
LIMITED WARRANTY.

Reference:
https://azure.microsoft.com/en-gb/support/legal/preview-supplemental-terms/

Question: 373 CertyIQ

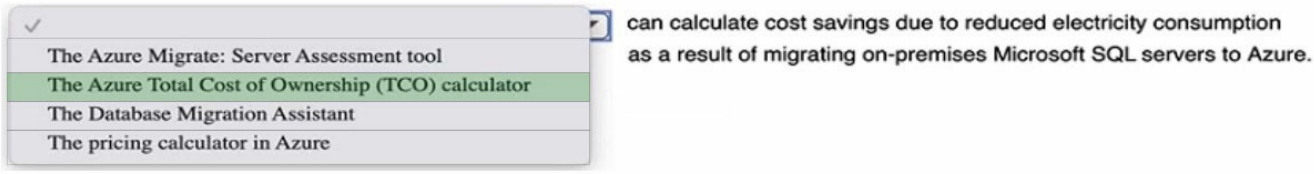
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

"Azure TCO calculator" is the answer.

https://learn.microsoft.com/en-us/training/modules/describe-cost-management-azure/3-compare-pricing-total-cost-of-ownership-calculators

The TCO calculator is designed to help you compare the costs for running an on-premises infrastructure compared to an Azure Cloud infrastructure. With the TCO calculator, you enter your current infrastructure configuration, including servers, databases, storage, and outbound network traffic. The TCO calculator then compares the anticipated costs for your current environment with an Azure environment supporting the same infrastructure requirements.

Reference:

https://docs.microsoft.com/en-us/learn/modules/plan-manage-azure-costs/2-compare-costs-tco-calculator

Question: 374

CertyIQ

You need to compare a company's cloud usage to industry standard best practices.
What should you use?

A. Azure Monitor
B. Azure Service Health
C. Application Insights in Azure Monitor
D. Azure Advisor

Answer: D

Explanation:

D- "As your personalized cloud consultant, Azure Advisor continually assesses your usage telemetry and resource configuration to check for industry best practices." https://learn.microsoft.com/en-

us/azure/advisor/azure-advisor-score

Question: 375 CertyIQ

You need to start Azure Cloud Shell.
What should you use?

A. the Azure portal
B. Azure Command-Line Interface (CLI)
C. Azure PowerShell
D. an Azure Resource Manager (ARM) template

Answer: A

Explanation:

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

You can access Cloud Shell in three ways:

- Direct link: Open a browser to https://shell.azure.com.

- Azure portal: Select the Cloud Shell icon on the Azure portal

- Code samples: In Microsoft technical documentation and training resources, select the Try It button that appears with Azure CLI and Azure PowerShell code snippets

https://learn.microsoft.com/en-us/azure/cloud-shell/overview

Question: 376 CertyIQ

How many copies of data are maintained by an Azure Storage account that uses locally-redundant storage (LRS)?

A. 3
B. 4
C. 6
D. 9

Answer: A

Explanation:

https://learn.microsoft.com/en-us/azure/storage/common/storage-redundancy#locally-redundant-storage

Locally redundant storage (LRS) replicates your storage account three times within a single data center in the primary region. LRS provides at least 99.999999999% (11 nines) durability of objects over a given year.

Question: 377 CertyIQ

What enables a cloud service to adapt quickly to changing requirements?

A. high availability
B. predictability
C. manageability
D. agility

Answer: D

Explanation:

D is correct. Agility: The ability to react quickly. Cloud services can allocate and deallocate resources quickly. They are provided on-demand via self-service, so vast amounts of computing resources can be provisioned in minutes. There is no manual intervention in provisioning or deprovisioning services.

Question: 378 CertyIQ

What is an example of vertical scaling in a cloud environment?

A. adding an additional CPU to an existing Azure virtual machine
B. adding an additional Azure virtual machine
C. adding an additional Azure Virtual Desktop session host
D. adding an additional Azure App Service instance automatically

Answer: A

Explanation:

Vertical scaling, also known as scaling up or scaling out, is the process of increasing the capacity of a single resource, such as a virtual machine or a database, to meet the demands of a workload. This can be done by adding more resources to the existing resource, such as additional CPUs, memory, or storage.

An example of vertical scaling in a cloud environment is adding an additional CPU to an existing Azure virtual machine. This can be done by modifying the VM's size or configuration to include more CPUs, which will allow it to handle a larger workload or more concurrent requests.

Other examples of vertical scaling in a cloud environment include adding more memory to a database server, or increasing the capacity of a storage volume.

Vertical scaling is typically used to address short-term or temporary increases in workload demand, and is often a faster and simpler way to scale a resource than horizontal scaling, which involves adding additional instances of a resource.

Question: 379 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Microsoft Defender for Cloud can monitor Azure resources and on-premises resources.	◯	◯
All Microsoft Defender for Cloud features are free.	◯	◯
For Microsoft Defender for Cloud, you can download a Regulatory Compliance report.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Microsoft Defender for Cloud can monitor Azure resources and on-premises resources.	◯	◯
All Microsoft Defender for Cloud features are free.	◯	◯
For Microsoft Defender for Cloud, you can download a Regulatory Compliance report.	◯	◯

Explanation:

Box 1: YES

"Microsoft Defender for Cloud is a Cloud Security Posture Management (CSPM) and Cloud Workload Protection Platform (CWPP) for all of your Azure, on-premises, and multicloud (Amazon AWS and Google GCP) resources." First sentence from https://docs.microsoft.com/en-us/azure/defender-for-cloud/defender-for-cloud-introduction. So first answer should be YES.

Box 2: NO

Defender for Cloud includes Foundational CSPM capabilities for free. You can also enable advanced CSPM capabilities by enabling the Defender CSPM plan.

This means that foundational features are free and Advanced features come as a cost. This negates the statement as clearly not "all Microsoft Defender for cloud features aee free

Box 3: YES

Now in Microsoft Defender for Cloud, you can easily create & download Audit reports for Regulatory Compliance Standards.

Question: 380 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Cloud computing offers lower capital expenditure (CAPEX) costs than on-premises deployments.	◯	◯
Cloud computing provides the same configuration options as on-premises deployments.	◯	◯
Cloud computing can scale when a business requires change.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Cloud computing offers lower capital expenditure (CAPEX) costs than on-premises deployments.	◯	◯
Cloud computing provides the same configuration options as on-premises deployments.	◯	◯
Cloud computing can scale when a business requires change.	◯	◯

Explanation:

Y- Capital expenditures (CapEx) are funds used by a company to acquire, upgrade, and maintain physical assets such as property, plants, buildings, technology, or equipment. These costs are lower in cloud computing than in on-premises deployments.

Y- Cloud computing in general provides the same configuration options as on-premises deployments. If you compare a specific product such as Exchange Online vs. Exchange Server or Azure SQL vs. SQL Server this might not be true. But, you could install Exchange Server on a virtual machine in the cloud to get the same configuration options.

Y- Cloud computing allows to increase or decrease IT resources as needed to meet changing demand. Scalability is one of the hallmarks of the cloud and the primary driver of its exploding popularity with businesses.

Question: 381 CertyIQ

What additional resource is required by an Azure virtual machine?

A. a virtual network
B. a service endpoint
C. Azure Firewall
D. a public IP address

Answer: A

Explanation:

A- Virtual Network is a mandatory resource required by Azure VM Public IP is an additional option for VM. Keyword is "additional resource"

Question: 382 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Functions is an example of a platform as a service (PaaS) cloud service model.	◯	◯
Microsoft 365 is an example of a software as a service (SaaS) cloud service model.	◯	◯
An Azure virtual machine is an example of an infrastructure as a service (IaaS) cloud service model.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Azure Functions is an example of a platform as a service (PaaS) cloud service model.	◯	◯
Microsoft 365 is an example of a software as a service (SaaS) cloud service model.	◯	◯
An Azure virtual machine is an example of an infrastructure as a service (IaaS) cloud service model.	◯	◯

Explanation:

Yes

Yes

Yes

Azure Functions is the new kid on the block in the Azure platform. It's a key ingredient of serverless compute that's needed to achieve the benefits of a cloud PaaS implementation. Azure Functions turns the focus to the value of the code and away from managing infrastructure.

https://learn.microsoft.com/en-us/archive/msdn-magazine/2017/february/azure-serverless-architecture-with-azure-functions

Question: 383 CertyIQ

How many copies of data are maintained by an Azure Storage account that uses geo-redundant storage (GRS)?

A. 3
B. 4
C. 6
D. 9

Answer: C

Explanation:

C is correct: https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy#geo-redundant-storage "Geo-redundant storage (GRS) copies your data synchronously three times within a single physical location in the primary region using LRS. It then copies your data asynchronously to a single physical location in a secondary region that is hundreds of miles away from the primary region."

Question: 384 CertyIQ

What is used to grant permission to Azure Virtual Desktop resources?

A. tags
B. role-based access control (RBAC) roles
C. resource groups
D. application security groups

Answer: B

Explanation:

In Azure, you can use role-based access control (RBAC) to grant permissions to Azure Virtual Desktop resources. RBAC is a system that allows you to manage access to Azure resources based on roles.

In RBAC, you can define roles that represent a set of permissions, and then assign those roles to users or groups. For example, you can create a role that allows users to view and manage Azure Virtual Desktop resources, and then assign that role to a group of users who need to access those resources.

Question: 385 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Virtual networks created in the same resource group must have unique names.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Virtual networks created in the same resource group must have unique names.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Explanation:

No

Yes

Yes

Question: 386

CertyIQ

DRAG DROP
-
Match the cloud computing benefits to the appropriate requirements.
To answer, drag the appropriate benefit from the column on the left to its requirement on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.

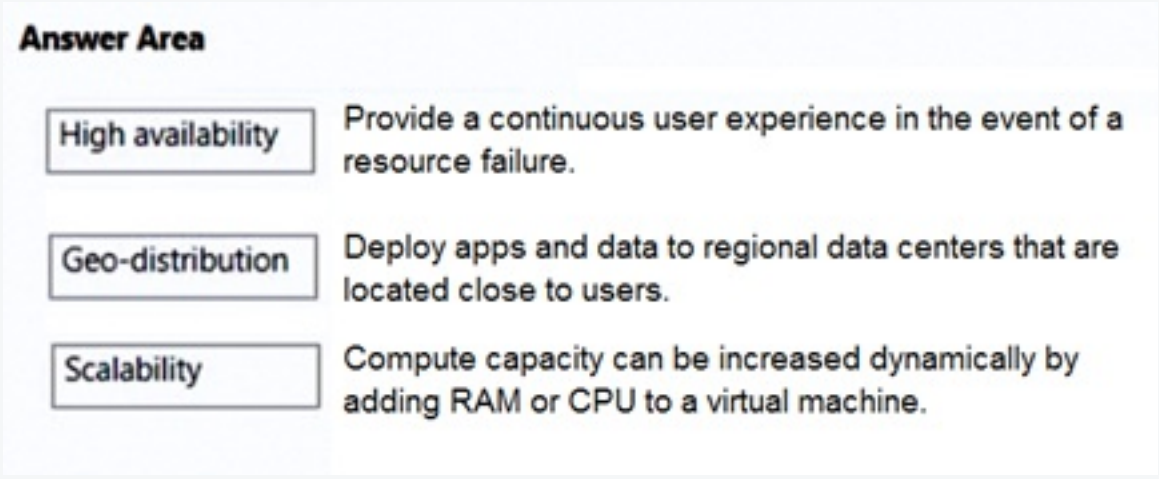
Benefits

- Disaster recovery
- Geo-distribution
- High availability
- Scalability

Answer Area

Benefit	Provide a continuous user experience in the event of a resource failure.
Benefit	Deploy apps and data to regional data centers that are located close to users.
Benefit	Compute capacity can be increased dynamically by adding RAM or CPU to a virtual machine.

Answer:



Explanation:

High availability

When you're deploying an application, a service, or any IT resources, it's important the resources are available when needed. High availability focuses on ensuring maximum availability, regardless of disruptions or events that may occur.

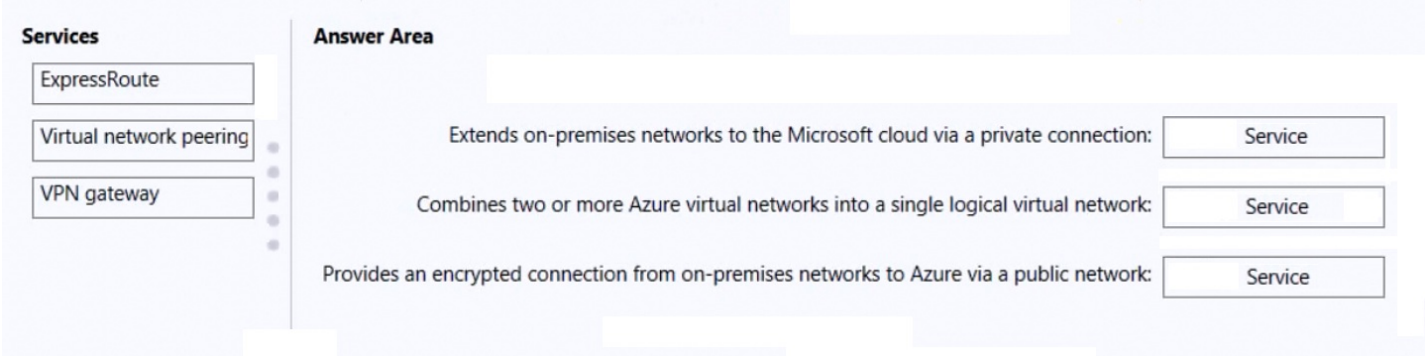
Scalability

Another major benefit of cloud computing is the scalability of cloud resources. Scalability refers to the ability to adjust resources to meet demand. If you suddenly experience peak traffic and your systems are overwhelmed, the ability to scale means you can add more resources to better handle the increased demand.

Question: 387

CertyIQ

DRAG DROP
-
Match the Azure services to the appropriate descriptions.
To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Answer Area

Explanation:

1. Extends on-premises networks to the Microsoft cloud via a private connection:

Answer: ExpressRoute

Detailed : Azure ExpressRoute allows you to create private connections between Microsoft datacenters and your on-premises infrastructure or co-location facilities. Crucially, ExpressRoute connections do not go over the public internet. This provides higher reliability, faster speeds, lower latencies, and greater security than typical connections over the internet.

2. Combines two or more Azure virtual networks into a single logical virtual network:

Answer: Virtual network peering

Detailed : Virtual network (VNet) peering enables you to seamlessly connect multiple virtual networks in Azure. Once peered, the VNets appear as a single logical network for connectivity purposes. Traffic between virtual machines in peered VNets uses the private Microsoft backbone infrastructure, maintaining low latency and high bandwidth without requiring a gateway or public internet traversal.

3. Provides an encrypted connection from on-premises networks to Azure via a public network:

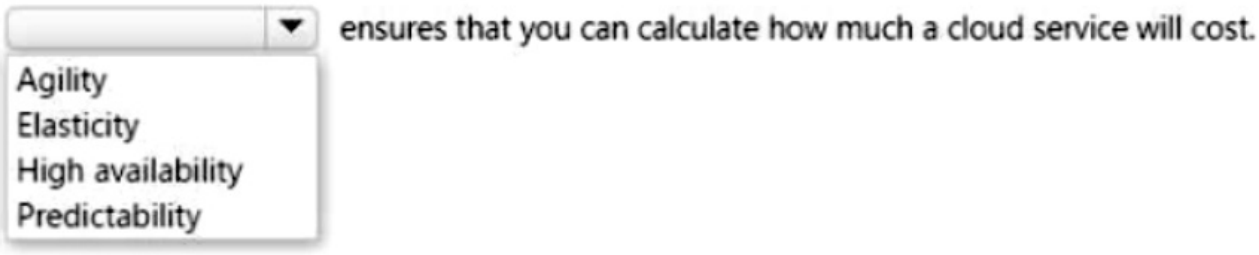
Answer: VPN gateway

Detailed : An Azure VPN Gateway is a specific type of virtual network gateway that is used to send encrypted traffic between an on-premises location and an Azure VNet. Unlike ExpressRoute, this connection travels across the public internet via an encrypted tunnel (typically utilizing IPsec/IKE protocol suites), making it a cost-effective solution for Site-to-Site hybrid connectivity.

Question: 388 CertyIQ

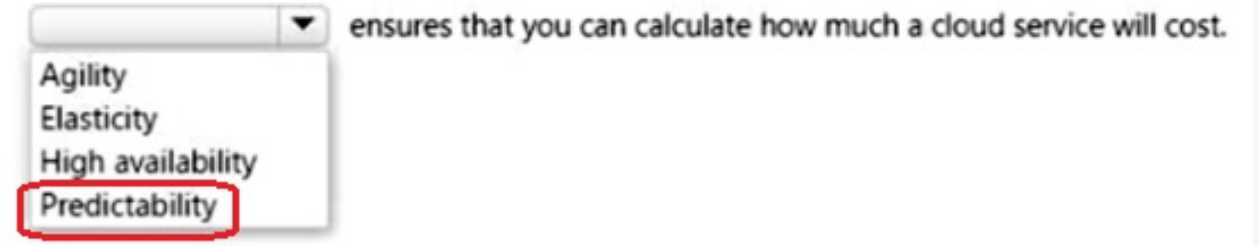
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

Predictability

Predictability in the cloud lets you move forward with confidence. Predictability can be focused on performance predictability or cost predictability. Both performance and cost predictability are heavily influenced by the Microsoft Azure Well-Architected Framework. Deploy a solution that's built around this framework and you have a solution that's cost and performance are predictable.

https://learn.microsoft.com/en-us/training/modules/describe-benefits-use-cloud-services/3-reliability-predictability-cloud

Question: 389 CertyIQ

Which cloud service model minimizes the management responsibility of a customer?

A. infrastructure as a service (IaaS)
B. platform as a service (PaaS)
C. software as a service (SaaS)

Answer: C

Explanation:

Software as a service (SaaS) is a cloud service model that allows customers to access and use software applications over the internet. In the SaaS model, the provider is responsible for managing and maintaining the infrastructure, software, and data associated with the application. The customer pays a subscription fee to use the software and does not need to worry about installing, configuring, or maintaining the software.

SaaS minimizes the management responsibility of the customer, as the provider handles most of the management tasks, such as provisioning, scaling, patching, and updating the software. This allows the customer to focus on using the software to meet their business needs, rather than worrying about the underlying infrastructure.

Question: 390

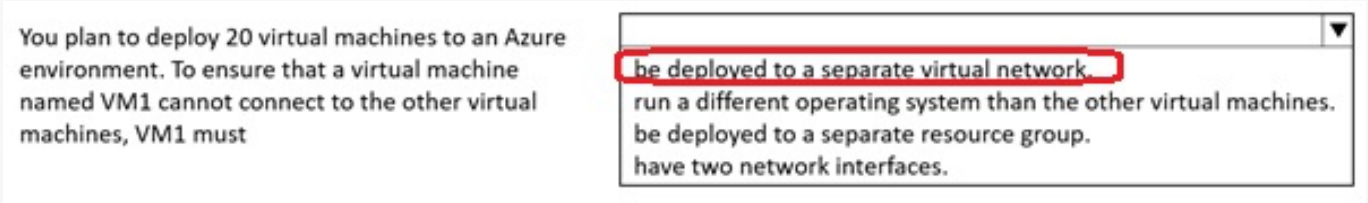
CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

- be deployed to a separate virtual network.
- run a different operating system than the other virtual machines.
- be deployed to a separate resource group.
- have two network interfaces.

Answer:



Explanation:

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must be deployed to a separate virtual network.

Question: 391

CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

An organization that hosts its own infrastructure [ ] no longer requires a data center.

- in a private cloud
- in a hybrid cloud
- in the public cloud
- on a Hyper-V host

Answer:

An organization that hosts its own infrastructure [▼] no longer requires a data center.

- in a private cloud
- in a hybrid cloud
- **in the public cloud**
- on a Hyper-V host

Explanation:

in the public cloud.

Question: 392 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

When a cloud app can allocate and release resources, it has [▼]

- elasticity.
- governance.
- high availability.
- predictability.
- reliability.

Answer:

Answer Area

When a cloud app can allocate and release resources, it has [▼]

- **elasticity.**
- governance.
- high availability.
- predictability.
- reliability.

Explanation:

Elastic computing is the ability to quickly expand or decrease computer processing, memory, and storage resources to meet changing demands without worrying about capacity planning and engineering for peak usage. Typically controlled by system monitoring tools, elastic computing matches the amount of resources allocated to the amount of resources actually needed without disrupting operations. With cloud elasticity, a company avoids paying for unused capacity or idle resources and doesn't have to worry about investing in the purchase or maintenance of additional resources and equipment.

https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-elastic-computing/

Question: 393 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

Answer:

Answer Area

Explanation:

Azure Functions is a serverless solution that allows you to write less code, maintain less infrastructure, and save on costs.

Question: 394

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The Archive access tier for Azure Storage can be set at the account level.	○	○
The Cool access tier offers the lowest costs for storing blobs in Azure Storage.	○	○
After blobs are uploaded to an Azure Storage container, the access tier of the storage account can be changed.	○	○

Answer:

Answer Area

Statements	Yes	No
The Archive access tier for Azure Storage can be set at the account level.	○	○
The Cool access tier offers the lowest costs for storing blobs in Azure Storage.	○	○
After blobs are uploaded to an Azure Storage container, the access tier of the storage account can be changed.	○	○

Explanation:

No

No

Yes

The archive access tier for Azure Storage cannot be set at the account level. It can only be set at the blob level

Hot, cool, and archive tiers can be set at the blob level

The Archive Tier has the lowest storage cost of them all

Hot Tier: Storage Cost: Highest / Access Cost: Lowest

Cool Tier: Storage Cost: Medium / Access Cost: Medium

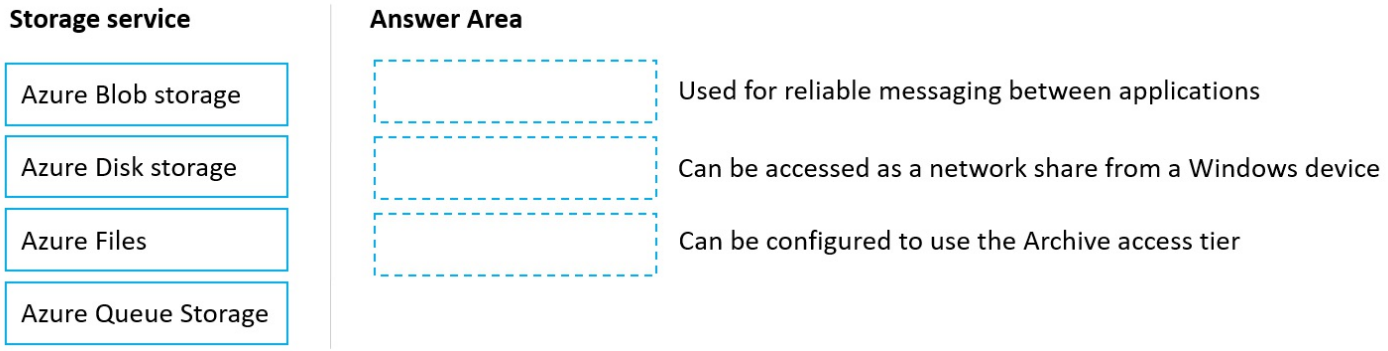
Archive Tier: Storage Cost: Lowest/ Access Cost: Highest

Reference:

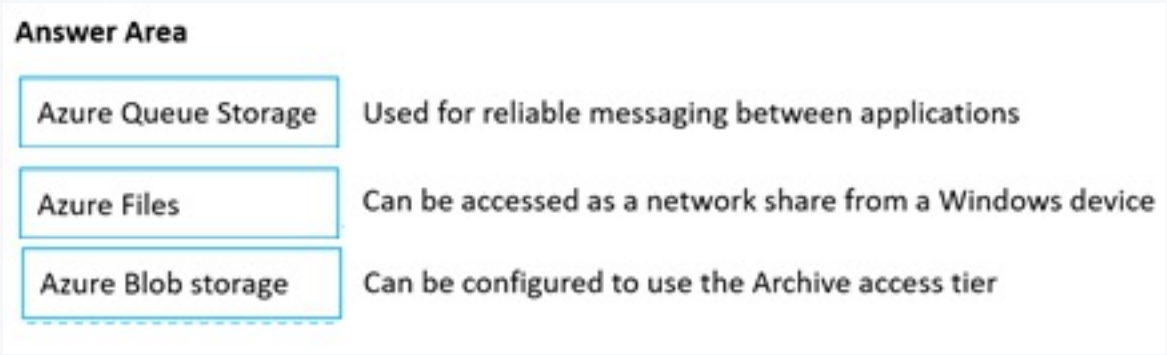
https://learn.microsoft.com/en-us/azure/storage/blobs/access-tiers-overview

Question: 395 CertyIQ

DRAG DROP
-
Match the Azure storage services to the appropriate descriptions.
To answer, drag the appropriate storage service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:



Explanation:

Azure Queue storage is a fully managed, cloud-based message queue service.

Azure Queue Storage is a service for storing large numbers of messages. You access messages from anywhere in the world via authenticated calls using HTTP or HTTPS. A queue message can be up to 64 KB in size. A queue may contain millions of messages, up to the total capacity limit of a storage account. Queues are commonly used to create a backlog of work to process asynchronously

https://learn.microsoft.com/en-us/azure/storage/queues/storage-queues-introduction

Azure Files allows you to create file shares in the cloud that can be accessed by both Windows and Linux clients over the SMB (Server Message Block) protocol.

Question: 396 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Premium storage accounts can be configured as Azure file shares.	○	○
Premium storage accounts can be configured as block blobs storage.	○	○
Premium storage accounts can be configured as StorageV2 storage.	○	○

Answer:

Answer Area

Statements	Yes	No
Premium storage accounts can be configured as Azure file shares.	○	○
Premium storage accounts can be configured as block blobs storage.	○	○
Premium storage accounts can be configured as StorageV2 storage.	○	○

Explanation:

1: True.

Premium storage accounts provide high-performance storage for Azure virtual machines. Using premium storage accounts to create file shares can provide better performance and increased reliability compared to standard storage accounts.

2:True.

Block blobs are used to store unstructured data, such as text and images, and can be up to 4.75 TB in size. Using premium storage accounts for block blobs can provide better performance and increased reliability compared to standard storage accounts.

3: False.

Premium storage accounts cannot be configured as a storageV2 storage accounts. StorageV2 storage account is a new version of General purpose storage accounts, that provide all the features of the General purpose v1 and additional features and capabilities such as larger file shares, higher IOPS and throughput, and archive storage tier.

Question: 397

CertyIQ

HOTSPOT

-
Select the answer that correctly completes the sentence.

Answer Area

Premium block blobs storage accounts only support [ ] redundancy.

- geo-redundant storage (GRS)
- geo-zone-redundant storage (GZRS)
- locally-redundant storage (LRS)
- zone-redundant storage (ZRS)

Answer:

Answer Area

Premium block blobs storage accounts only support [zone-redundant storage (ZRS)] redundancy.

Explanation:

Key word - 'redundancy', means it will have to be stored in more than one place. So answer is correct, ZRS.

Question: 398

CertyIQ

You have an Azure web app.
You need to manage the settings of the web app from an iPhone.
What are two Azure management tools that you can use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Windows PowerShell
B. Azure Cloud Shell
C. the Azure portal
D. Azure Storage Explorer

Answer: BC

Explanation:

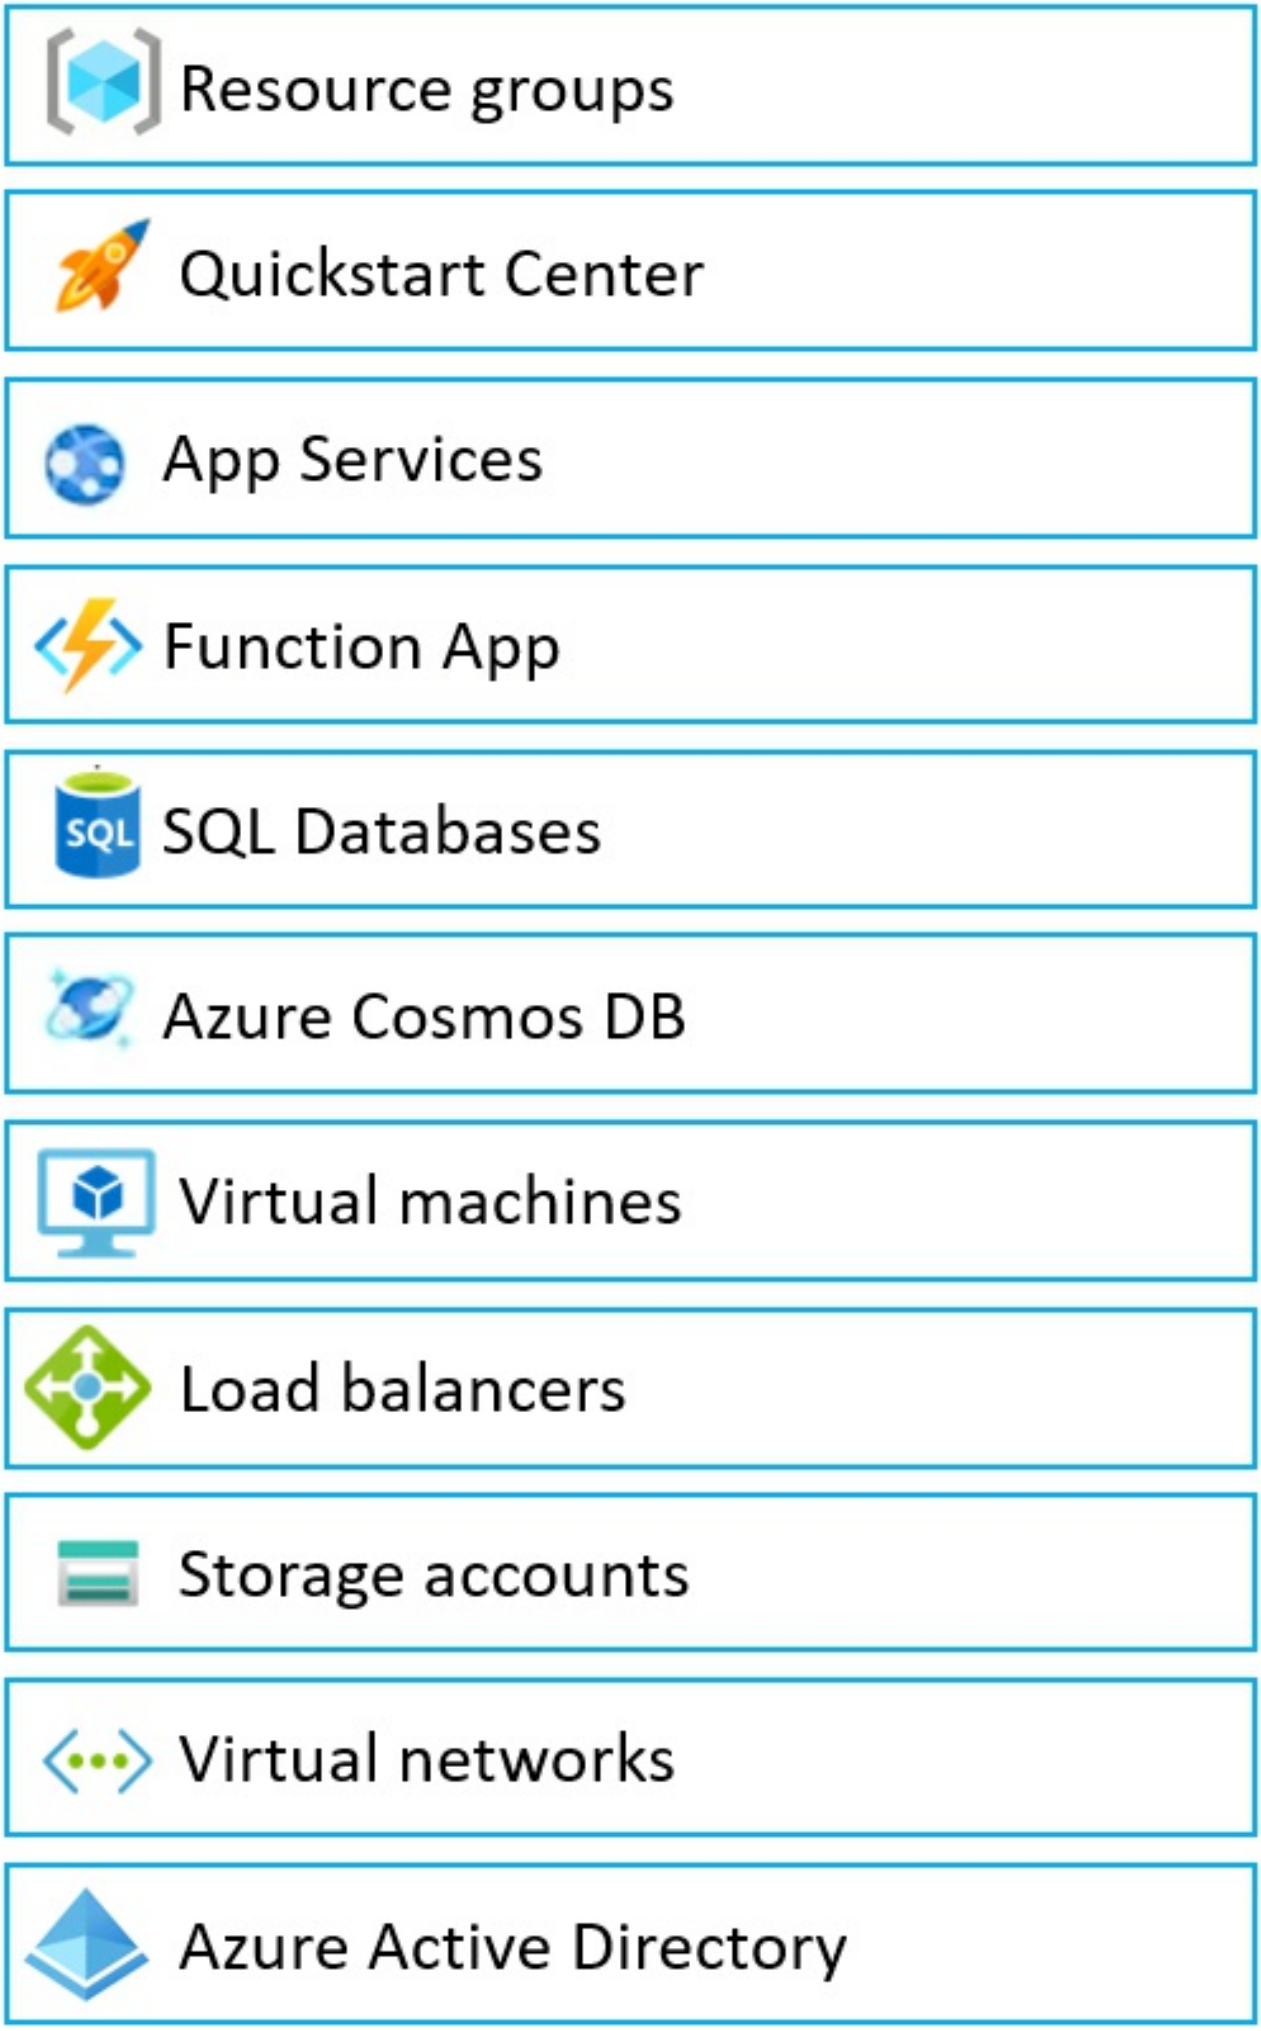
https://azure.microsoft.com/en-us/get-started/azure-portal/mobile-app

Question: 399

CertyIQ

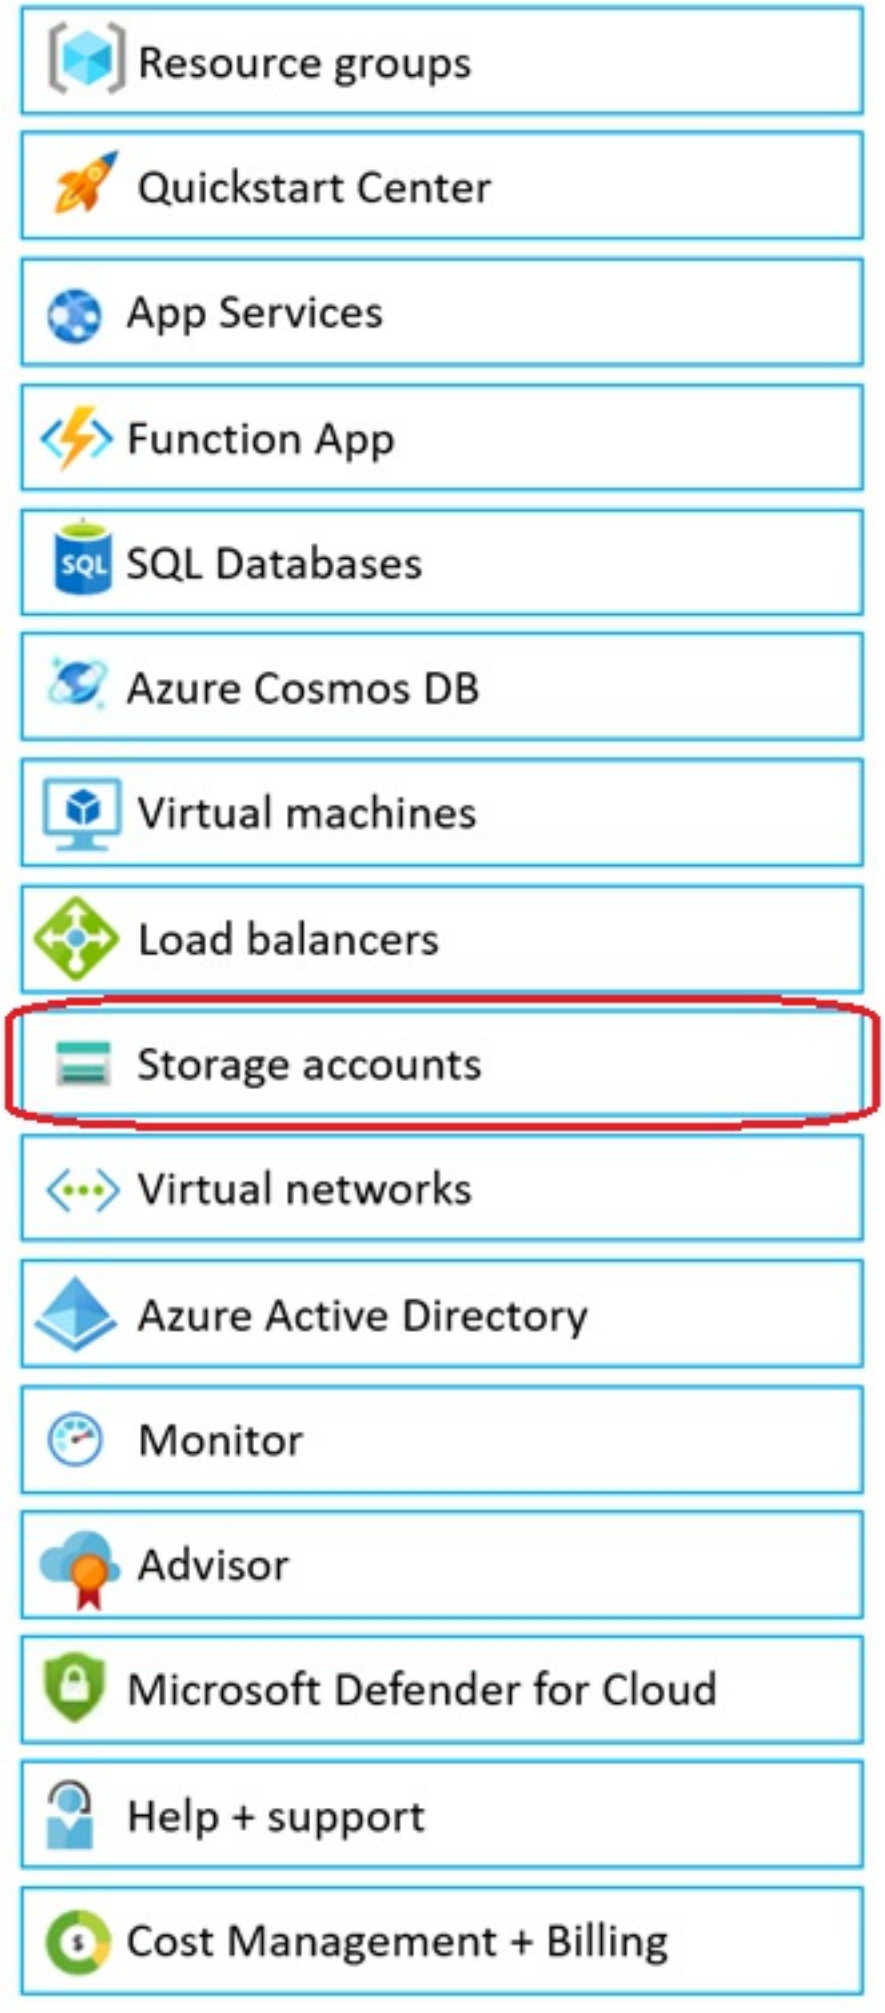
HOTSPOT
-
You need to create a new Azure file share.

What should you use? To answer, select the service in the answer area.
NOTE: Each correct selection is worth one point.



Monitor
Advisor
Microsoft Defender for Cloud
Help + support
Cost Management + Billing

Answer:



Resource groups
Quickstart Center
App Services
Function App
SQL Databases
Azure Cosmos DB
Virtual machines
Load balancers
Storage accounts
Virtual networks
Azure Active Directory
Monitor
Advisor
Microsoft Defender for Cloud
Help + support
Cost Management + Billing

Question: 400 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can deploy Azure Resource Manager (ARM) templates by using the Azure portal.	○	○
Azure Resource Manager (ARM) templates can define infrastructure by using code.	○	○
Each Azure resource to be deployed requires a separate Azure Resource Manager (ARM) template.	○	○

Answer:

Answer Area

Statements	Yes	No
You can deploy Azure Resource Manager (ARM) templates by using the Azure portal.	○	○
Azure Resource Manager (ARM) templates can define infrastructure by using code.	○	○
Each Azure resource to be deployed requires a separate Azure Resource Manager (ARM) template.	○	○

Explanation:

YYN

it is not necessary to use a separate template for each resource. For example, an ARM template can define a virtual machine, a storage account, and a virtual network altogether in a single template.

Question: 401 CertyIQ

What should you use to prevent traffic from an Azure virtual network from being routed to an Azure Storage account via the internet?

A. a network security group (NSG)
B. a public endpoint
C. Azure VPN Gateway
D. a service endpoint

Answer:

D

Explanation:

1. I'd go with D

2. A storage account is an Azure Resource Manager resource.

Question: 402 CertyIQ

Which service can replace a resource lock automatically if the lock is removed?

A. Azure Information Protection (AIP)
B. Azure Blueprints
C. Azure Backup
D. Azure Advisor

Answer: B

Explanation:

It's typically possible for someone with appropriate Azure role-based access control (Azure RBAC) on the subscription, such as the 'Owner' role, to be allowed to alter or delete any resource. This access isn't the case when Azure Blueprints applies locking as part of a deployed assignment. If the assignment was set with the Read Only or Do Not Delete option, not even the subscription owner can perform the blocked action on the protected resource.

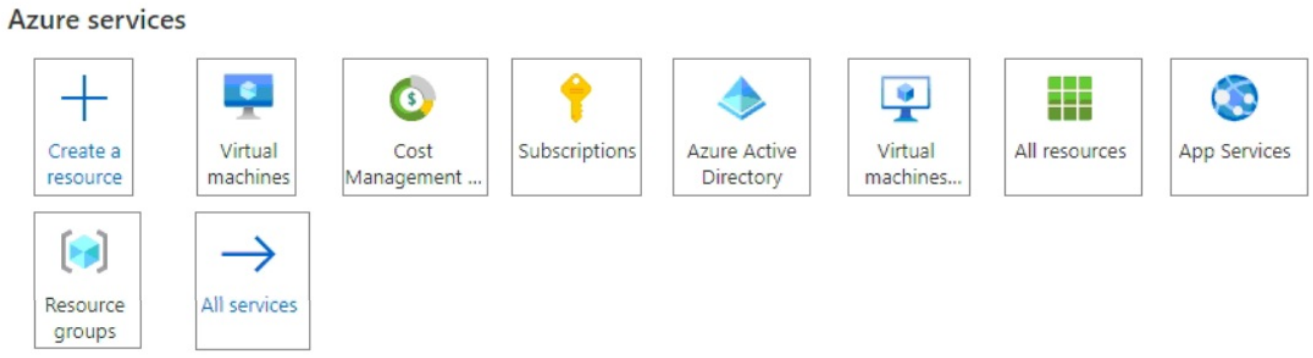
This security measure protects the consistency of the defined blueprint and the environment it was designed to create from accidental or programmatic deletion or alteration.

https://learn.microsoft.com/en-us/azure/governance/blueprints/concepts/resource-locking#overriding-locking-states

Question: 403 CertyIQ

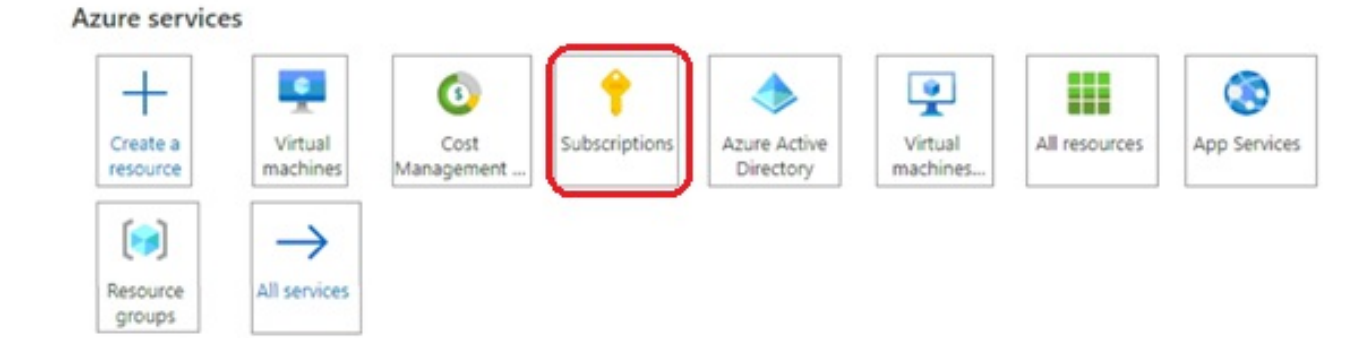
HOTSPOT
-
You need to create a new user for an Azure subscription.
What should you use? To answer, select the service in the answer area.
NOTE: Each correct match is worth one point.

Answer Area



Answer:

Answer Area



Explanation:

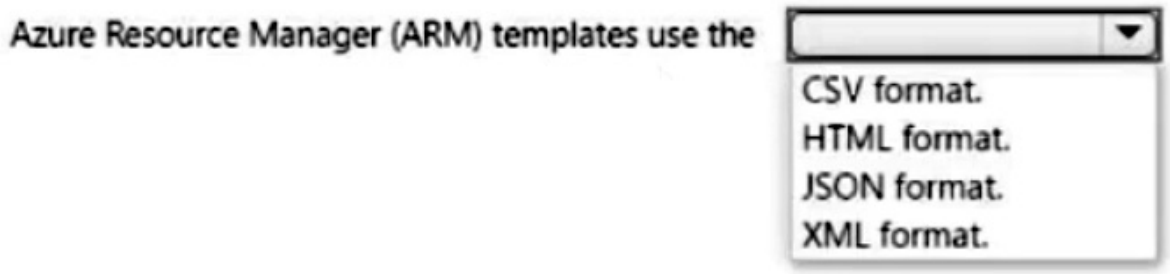
The keyword is **subcription**

At the Azure portal, select Subscriptions. Select the subscription you want to assign and then select Access Control. Select Add to add a user to the subscription. After you add the user to the subscription, you can assign the user a role and the account to which the user will have access.

Question: 404 CertyIQ

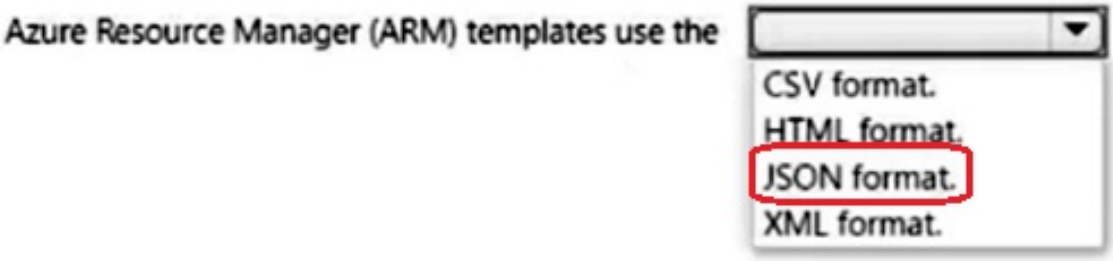
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

"JSON format" is the answer.

https://learn.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

To implement infrastructure as code for your Azure solutions, use Azure Resource Manager templates (ARM templates). The template is a JavaScript Object Notation (JSON) file that defines the infrastructure and configuration for your project. The template uses declarative syntax, which lets you state what you intend to deploy without having to write the sequence of programming commands to create it. In the template, you specify the resources to deploy and the properties for those resources.

Question: 405

CertyIQ

You plan to collect and analyze event details for five Azure virtual machines.
You need to run queries to compare the event details collected from all the virtual machines.
Which two tools should you use? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Azure Service Health
B. Azure Service Bus
C. Azure Monitor
D. Azure Advisor
E. Log Analytics

Answer: CE

Explanation:

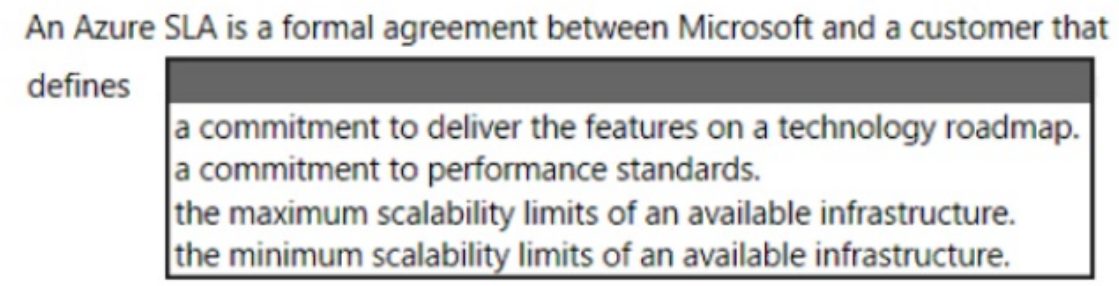
Log Analytics: Use this primary tool in the Azure portal to edit log queries and interactively analyze their results. Even if you intend to use a log query elsewhere in Azure Monitor, you'll typically write and test it in Log Analytics before you copy it to its final location.

https://learn.microsoft.com/en-us/azure/azure-monitor/logs/log-query-overview

Question: 406 CertyIQ

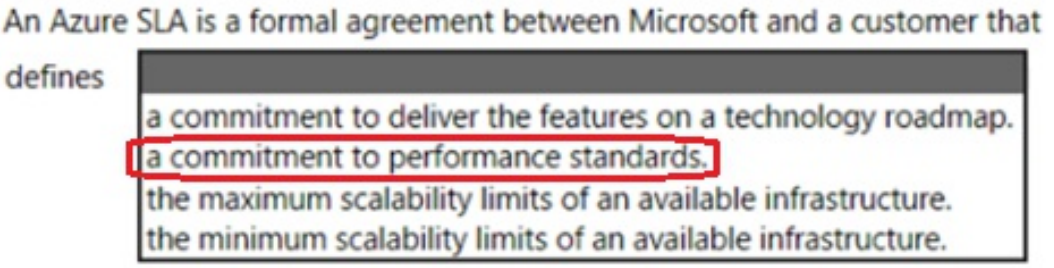
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

"a commitment to performance standards" is the the answer.

An Azure Service Level Agreement (SLA) is a formal agreement between Microsoft and a customer that defines the level of service and availability that Microsoft will provide for a specific Azure service.

The SLA typically includes metrics such as uptime, availability, and responsiveness, and specifies the guarantees that Microsoft will make in terms of meeting those metrics.

In more detail, an Azure SLA outlines the service level targets and credit system for Azure service, ensuring that customer will receive a credit towards their bill if they don't meet the agreed-upon service level. It guarantees a certain level of uptime (i.e. availability) for a given Azure service, and if that service falls below that level, customer may be eligible for a service credit to be applied to their account.

Question: 407 CertyIQ

What should you use to track the costs of Azure resources?

A. Azure Quickstart templates
B. tags
C. budgets
D. usage and quotas

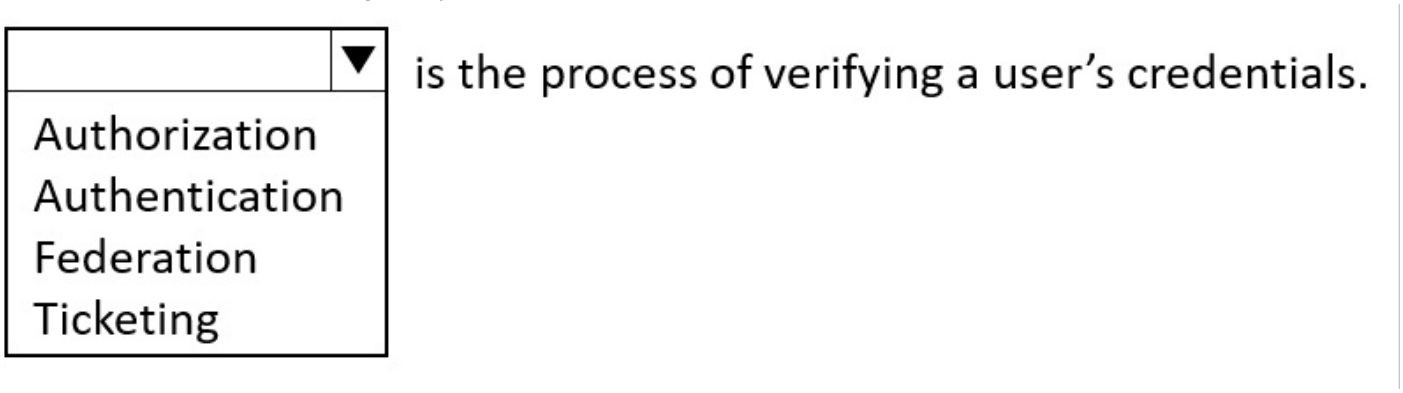
Answer: D

Explanation:

Usage and quotas allow you to monitor and control resource usage, and prevent unexpected charges. You can set quotas on resources to limit the amount of usage, and use Azure Monitor to track usage and performance metrics. This helps you identify inefficiencies and optimize your resource usage to save costs.Tags allow you to categorize Azure resources and add metadata to them, which makes it easier to track and manage costs. You can use tags to organize resources by department, project, environment, or any other category that makes sense for your organization. Once you have tagged your resources, you can use the Azure Cost Management and Billing tool to analyze costs by tag and get a better understanding of where your money is going.Budgets allow you to set spending limits and get alerts when you are approaching or exceeding those limits. You can set budgets at the subscription, resource group, or resource level, and receive email notifications when spending reaches a certain threshold. Budgets help you stay on top of costs and avoid unexpected charges.

Question: 408 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:

Explanation:

Authentication is the process of proving that you are who you say you are.

Authorization is the act of granting an authenticated party permission to do something.

https://learn.microsoft.com/en-us/azure/active-directory/develop/authentication-vs-authorization

Therefore answer should be Authentication

Question: 409 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure.
- reduce the number of connections to the website.

Answer:

When planning to migrate a public website to Azure, you must plan to pay monthly usage costs.

Explanation:

B. pay monthly usage costs: Azure is a pay-as-you-go service, which means that you will be charged based on your usage. You must plan to pay monthly usage costs for the Azure services and resources you use to host your website.

Question: 410 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

- Resource groups
- Management groups
- Azure policies
- Azure App Service plans

provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

Answer:

- Resource groups
- **Management groups**
- Azure policies
- Azure App Service plans

provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

Explanation:

"Management Groups" is the answer.

https://learn.microsoft.com/en-us/azure/governance/management-groups/overview

If your organization has many Azure subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Management groups provide a governance scope above subscriptions. You organize subscriptions into management groups; the governance conditions you apply cascade by inheritance to all associated subscriptions.

Question: 411 CertyIQ

You plan to reduce ongoing Azure expenditures.
You need to identify which factors affect the costs of a resource.
Which three factors should you identify? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. the volume of outbound data
B. the volume of inbound data
C. the service tier
D. the Azure region
E. the type of processed data

Answer: ACD

Explanation:

A C D

There are several factors that can affect the costs of a resource in Azure. Here are three factors that you should consider when trying to identify which factors are affecting the costs of a resource:

The volume of outbound data: The volume of data that is transferred out of Azure can affect the costs of a resource. For example, if you have a resource that generates a large volume of outbound data, such as a web server that serves a lot of content to users, this can result in higher costs.

The service tier: The service tier that you choose for a resource can also affect its costs. For example, if you choose a higher service tier, such as a more powerful virtual machine, this can result in higher costs.

The Azure region: The Azure region in which a resource is deployed can also affect its costs. Azure regions are geographical areas that contain one or more data centers, and the costs of resources can vary depending on the region in which they are deployed.

Question: 412 CertyIQ

Your company has an Azure subscription that contains several resources.
You need to identify which department is responsible for the cost of each resource.
What should you use?

A. budgets
B. alerts
C. tags

Answer: C

Explanation:

https://learn.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources?tabs=json#tags-and-billing

You can use tags to group your billing data. If you're running multiple VMs for different organizations, for example, use the tags to group usage by cost center. You can also use tags to categorize costs by runtime environment, such as the billing usage for VMs running in the production environment.

Question: 413 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer:

Explanation:

platform as a service (Paas)

Question: 414 CertyIQ

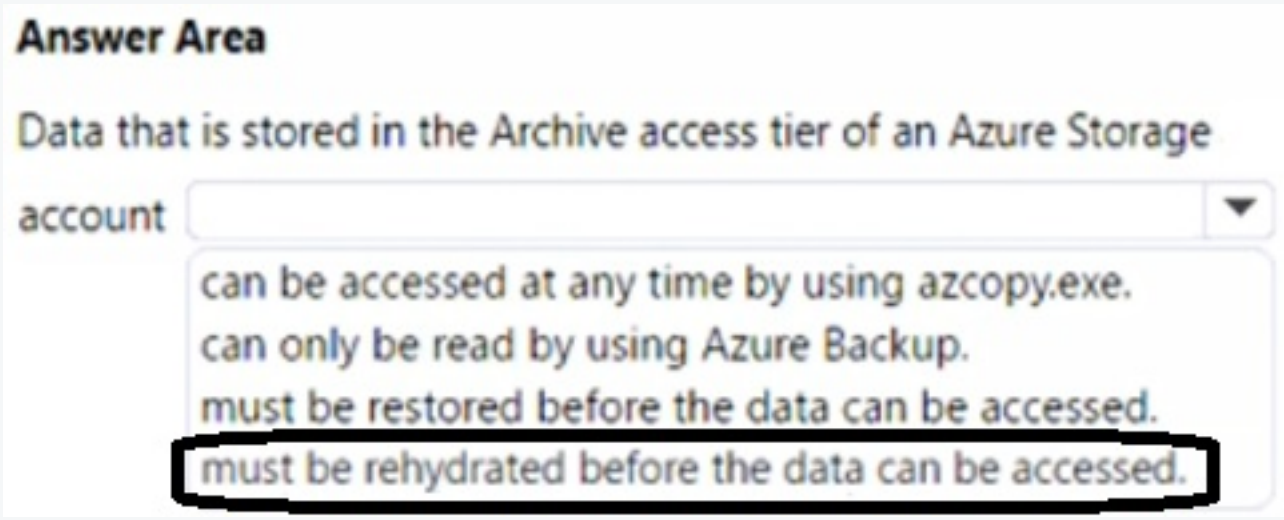
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Answer:



Explanation:

Data that is stored in the Archive access tier of an Azure Storage account must be rehydrated before the data can be accessed.

Question: 415 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
An Azure Virtual Desktop session host can run Windows 10 or Windows 11 only.	○	○
An Azure Virtual Desktop host pool that includes 20 session hosts supports maximum of 20 simultaneous user connections.	○	○
Azure Virtual Desktop supports desktop and app virtualization.	○	○

Answer:

Answer Area

Statements	Yes	No
An Azure Virtual Desktop session host can run Windows 10 or Windows 11 only.	○	●
An Azure Virtual Desktop host pool that includes 20 session hosts supports maximum of 20 simultaneous user connections.	○	●
Azure Virtual Desktop supports desktop and app virtualization.	●	○

Explanation:

Statement 1: An Azure Virtual Desktop session host can run Windows 10 or Windows 11 only.

Answer: No

While Windows 10 and Windows 11 (including their specialized Multi-session editions) are incredibly popular deployment choices, Azure Virtual Desktop natively supports server-based operating systems as session hosts as well. Organizations frequently deploy AVD session hosts running Windows Server 2022, Windows Server 2019, or Windows Server 2016 to run legacy enterprise software or specialized line-of-business applications.

Statement 2: An Azure Virtual Desktop host pool that includes 20 session hosts supports maximum of 20 simultaneous user connections.

Answer: No

This statement describes a strict 1:1 personal desktop assignment model, but AVD is highly utilized for its pooled host pools running Windows Client Multi-session or Windows Server. With multi-session configurations, a single session host virtual machine can support multiple independent user sessions concurrently. If you have 20 session hosts running multi-session configurations with a capacity limit set to 10 users per host, that single host pool could easily support up to 200 simultaneous user connections.

Statement 3: Azure Virtual Desktop supports desktop and app virtualization.

Answer: Yes

AVD allows administrators to provision two distinct types of application groups to meet user needs:

Desktop Virtualization (Full Desktop): Users log in and are presented with a complete, immersive virtualized desktop environment where they can access the full OS GUI.

App Virtualization (RemoteApp): Instead of provisioning an entire desktop workspace, you can publish individual, isolated applications (like Microsoft Excel or a custom legacy ERP tool). To the end user, these apps launch and run seamlessly in their own individual windows on their local machine, behaving exactly like a locally installed application.

Question: 416 CertyIQ

HOTSPOT

-

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
In an Azure virtual machine scale set, the virtual machines are configured identically.	○	○
The number of Azure virtual machines in a virtual machine scale set can increase automatically.	○	○
The number of Azure virtual machines in a virtual machine scale set can decrease automatically.	○	○

Answer:

Answer Area

Statements	Yes	No
In an Azure virtual machine scale set, the virtual machines are configured identically.	◉	○
The number of Azure virtual machines in a virtual machine scale set can increase automatically.	◉	○
The number of Azure virtual machines in a virtual machine scale set can decrease automatically.	◉	○

Explanation:

Statement 1: In an Azure virtual machine scale set, the virtual machines are configured identically.

Answer: Yes

An Azure Virtual Machine Scale Set is designed to deploy and manage a fleet of load-balanced virtual machines. To enable seamless scaling, all VM instances in the scale set are built from the exact same underlying base configuration. They share the identical operating system image, size SKU, storage disks, extension configurations, and network settings defined in the scale set's core configuration template.

Statement 2: The number of Azure virtual machines in a virtual machine scale set can increase automatically.

Answer: Yes

This is the core functionality of autoscale (scale-out). You can define autoscale rules based on performance metrics (such as average CPU utilization exceeding 75%, memory pressure, or network queue depth) or based on a specific calendar schedule. When these target thresholds are breached, the scale set automatically provisions and configures new identical VM instances to handle the increased workload.

Statement 3: The number of Azure virtual machines in a virtual machine scale set can decrease automatically.

Answer: Yes

This represents the complementary scale-in capability designed to optimize cloud spend. Just as a scale set can grow, you can configure corresponding autoscale rules to automatically deprovision and remove extra VM instances when application demand drops (for example, if average CPU utilization falls below 25%). This ensures you only pay for the compute resources you actively need.

Question: 417 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

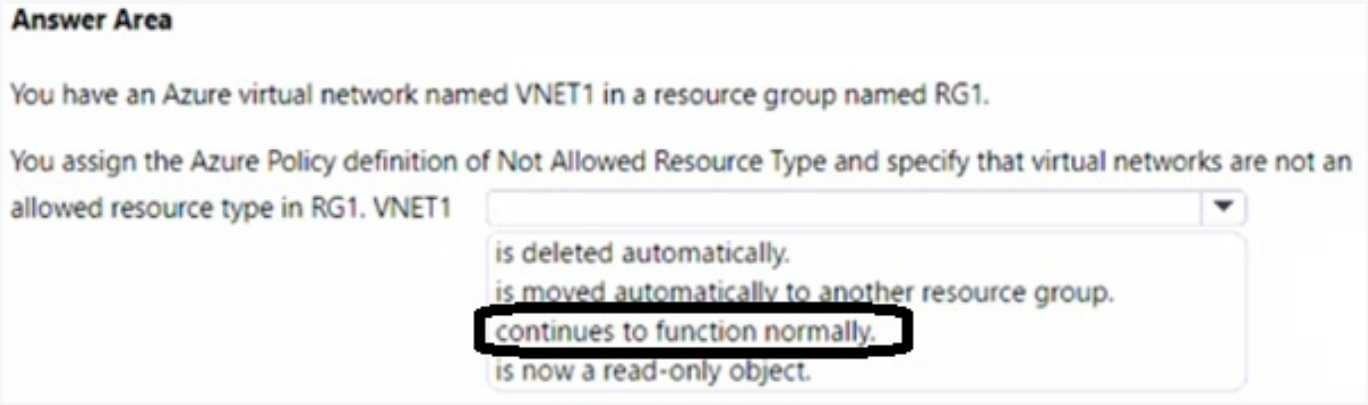
Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1 [ ]

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Answer:



Explanation:

You have an Azure virtual network named VNET1 in a resource group named RG1. You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1 continues to function normally.

Question: 418 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure Advisor provides personalized recommendations.	○	○
Azure Advisor can provide cost recommendations for virtual machines.	○	○
Azure Advisor can provide recommendations across multiple Azure subscriptions.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Advisor provides personalized recommendations.	○	○
Azure Advisor can provide cost recommendations for virtual machines.	○	○
Azure Advisor can provide recommendations across multiple Azure subscriptions.	○	○

Explanation:

Statement 1: Microsoft Entra ID requires user passwords to be at least eight characters long.

Answer: Yes

By default, Microsoft Entra ID enforces a strict built-in password policy for cloud users. This policy mandates that passwords must have a minimum length of 8 characters and a maximum of 256 characters. It also requires a mix of character complexities (uppercase, lowercase, numbers, and symbols).

Statement 2: Passwords for cloud-only user accounts in Microsoft Entra ID never expire by default.

Answer: Yes

Historically, corporate IT forced users to change passwords every 30 to 90 days. Modern Microsoft security research shows that regular forced password rotation actually causes users to pick weaker, predictable variations of their old passwords. Therefore, for cloud-only accounts, the default setting is PasswordNeverExpires. Global Administrators can override this, but out-of-the-box, they do not expire.

Statement 3: You can change the default lockout threshold for Microsoft Entra ID.

Answer: Yes

Microsoft Entra ID uses a security feature called Smart Lockout to lock out bad actors attempting to guess passwords via brute-force or dictionary attacks. By default, it locks an account after 10 failed attempts for a duration of 60 seconds. Administrators can customize these values by navigating to the Authentication methods -> Password protection pane to change the lockout threshold and duration to fit company security requirements.

Question: 419 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can assign an Azure policy to a virtual machine.	○	○
If an Azure policy is assigned to a resource group, noncompliant resources are removed from the group.	○	○
If an Azure policy is assigned to a resource group, only compliant resources can be deployed to the group.	○	○

Answer:

Answer Area

Statements	Yes	No
You can assign an Azure policy to a virtual machine.	◉	○
If an Azure policy is assigned to a resource group, noncompliant resources are removed from the group.	○	◉
If an Azure policy is assigned to a resource group, only compliant resources can be deployed to the group.	◉	○

Explanation:

Statement 1: You can assign an Azure policy to a virtual machine.

Answer: Yes (Correct in the image)

Azure Policy assignments can be scoped to different levels of your cloud hierarchy. While they are frequently applied at the Management Group, Subscription, or Resource Group level, you can target an individual resource directly. Alternatively, policies utilizing guest configurations can evaluate and enforce compliance settings directly inside a single specific virtual machine.

Statement 2: If an Azure policy is assigned to a resource group, noncompliant resources are removed from the

group.

Answer: No (Correct in the image)

Azure Policy is an evaluation and governance system, not an automated deletion service. If an existing resource inside a resource group breaks a newly assigned policy rule, its status is flagged as Non-compliant in the Azure portal for visibility. It is never automatically deleted or removed from the resource group by the policy evaluation engine.

Statement 3: If an Azure policy is assigned to a resource group, only compliant resources can be deployed to the group.

Answer: Yes (Correct in the image based on specific conditions)

Explanation: This depends entirely on the Effect defined inside the policy rule:

If the policy uses a Deny effect, Azure Resource Manager (ARM) will block the deployment of any new non-compliant resource entirely. In this scenario, the statement is completely true.

Note on nuance: If the policy uses other effects like Audit, Append, or Modify, a non-compliant resource can still be deployed (and will simply be flagged as non-compliant or altered during deployment). However, for standard exam scenarios testing the restrictive enforcement of policies, this statement is marked as Yes to reflect the preventative capabilities of a Deny policy assignment.

Question: 420 CertyIQ

You have on-premises servers that run Windows Server.
What should you implement to manage the servers by using the Azure portal?

A.Azure Kubernetes Service (AKS)
B.Azure Arc
C.Docker
D.role-based access control (RBAC)

Answer: B

Explanation:

Answer: B Azure Arc

Azure Arc allows us to extend Azure management and governance capabilities to your on-premises and multi-cloud environments. By implementing Azure Arc, we can connect your Windows Server machines to Azure and manage them centrally through the Azure portal, alongside your other Azure resources.

Question: 421 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

You can use [ ] in Azure to send email alerts when the cost of the current billing period for an Azure subscription exceeds a specified limit.

- Advisor recommendations
- Access control (IAM)
- Budget alerts
- Compliance

Answer:

Answer Area

You can use [Budget alerts] in Azure to send email alerts when the cost of the current billing period for an Azure subscription exceeds a specified limit.

Explanation:

Budget alerts are a native governance feature within the Azure Cost Management + Billing suite designed to prevent unexpected overages and cloud spend leakage.

Question: 422 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

If Windows Server or Microsoft SQL Server licenses are covered by [ ], you can repurpose the licenses on Azure virtual machines.

- an End User License Agreement (EULA)
- Microsoft Lifecycle Policy
- Software Assurance

Answer:

Answer Area

If Windows Server or Microsoft SQL Server licenses are covered by [Software Assurance], you can repurpose the licenses on Azure virtual machines.

Explanation:

Software assurance is a correct answer.

Question: 423 CertyIQ

You have a web app that runs in Azure.
You need to identify the amount of time it takes for web pages to load in a user's browser.
What should you use?

A.Azure Monitor alerts
B.Application Insights in Azure Monitor
C.Log Analytics
D.Azure Network Watcher

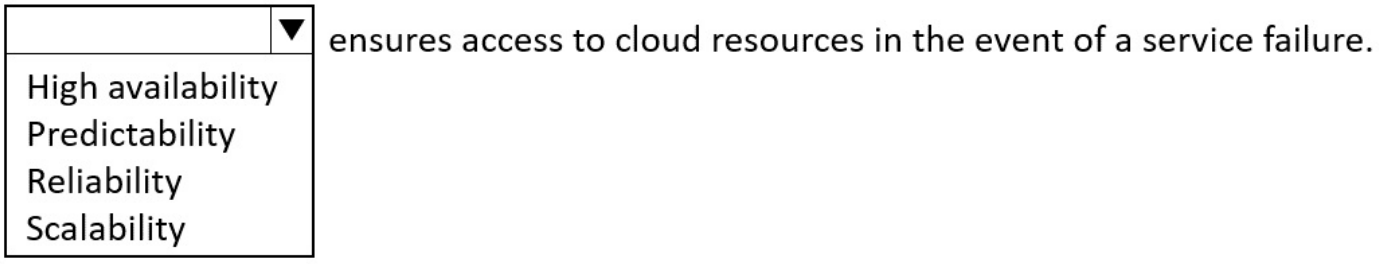
Answer: B

Explanation:

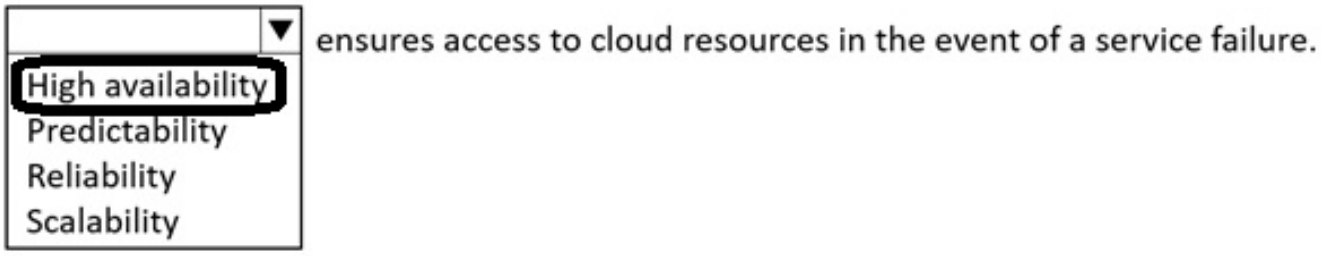
It's B: Azure Application Insights is a feature of Azure Monitor that allows to monitor running applications, automatically detect performance anomalies, and use built-in analytics tools to see what users do on an app.

Question: 424 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:



Explanation:

High availability ensures access to cloud resources in the event of a service failure.

High Availability (HA): This concept refers to a system's ability to remain continuously operational and accessible, even if an underlying component or localized service experiences a failure. In the cloud, this is achieved through built-in redundancies, such as deploying applications across multiple Availability Zones (AZs) with automated load balancing. If a hardware rack or an entire data center goes down, traffic is automatically rerouted to a healthy instance, ensuring zero or near-zero downtime for users.

Question: 425 CertyIQ

What should a desktop application use to interact with Azure and manage resources?

A.APIs
B.Azure Resource Manager (ARM) templates
C.Azure Command-Line Interface (CLI)
D.Azure Cloud Shell

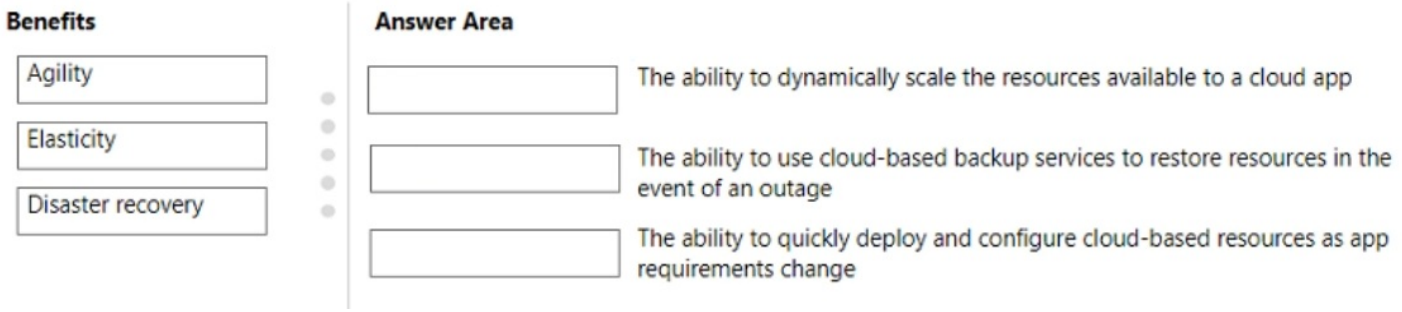
Answer: A

Explanation:

'A. APIs' is correct.Key is Desktop Applications which need to interact with Azure resources in a programmatical way, so APIs.

Question: 426 CertyIQ

DRAG DROP
-
Match the cloud computing benefits to the appropriate requirements.
To answer, drag the appropriate benefit from the column on the left to its requirement on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Explanation:

Elasticity $\rightarrow$ The ability to dynamically scale the resources available to a cloud appExplanation: Elasticity is the power of a system to automatically commission and decommission resources (like RAM, CPU, or virtual machines) on the fly to match current demand closely.

Disaster recovery $\rightarrow$ The ability to use cloud-based backup services to restore resources in the event of an outageExplanation: Disaster Recovery (DR) is a strategy focused on keeping applications

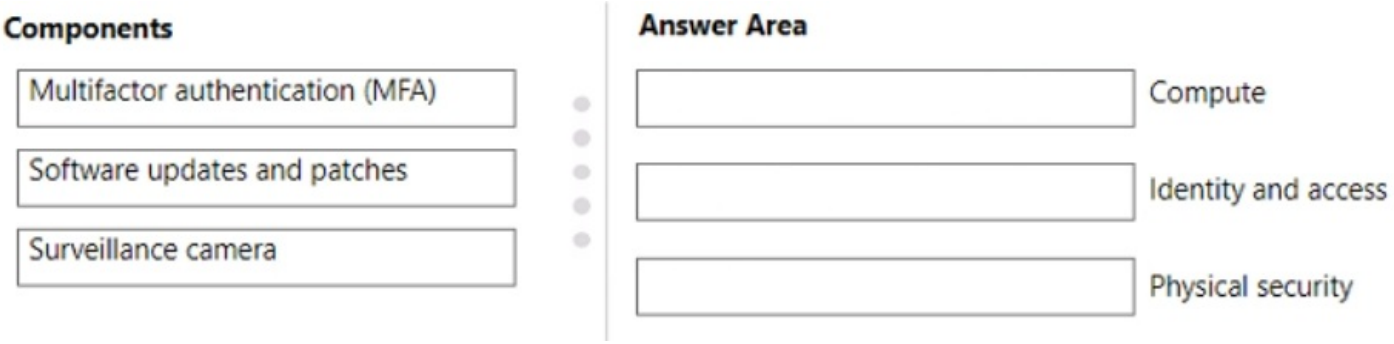
functional or rapidly restoring them following a catastrophic failure, network outage, or natural disaster.Key Context: DR relies heavily on data replication, backups, and cross-region failovers. If an entire data center goes dark due to a power grid failure, cloud-based disaster recovery ensures you can bring your applications back online using data mirrored in a separate, unaffected geographical region.

Agility $\rightarrow$ The ability to quickly deploy and configure cloud-based resources as app requirements changeExplanation: Agility is all about speed and flexibility from a business and development standpoint. It represents how rapidly an organization can respond to changes or test new ideas.Key Context: In a traditional on-premises data center, provisioning a new server could take weeks or months due to budgeting, hardware procurement, and physical installation. In the cloud, developers can deploy, configure, and teardown complex architectures in minutes using the portal, CLI, or infrastructure-as-code templates, allowing teams to innovate at an incredibly fast pace.

Question: 427

CertyIQ

DRAG DROP
-
Match the security components to the appropriate defense in depth layers.
To answer, drag the appropriate security component from the column on the left to its defense in depth layer on the right Each security component may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Explanation:

1. Software updates and patches $\rightarrow$ ComputeThe Layer: The Compute layer focus is entirely on securing the actual processing resources, such as virtual machines, container instances, or serverless functions running your applications.Why it matches: Unpatched operating systems and runtimes contain known vulnerabilities that attackers can exploit to gain control or execute arbitrary code. Applying software updates and security patches hardens the compute environments directly, minimizing the attack surface of those individual virtual machines or host environments.

2. Multifactor authentication (MFA) $\rightarrow$ Identity and accessThe Layer: The Identity and access layer controls access to infrastructure, applications, and data. It ensures that only authenticated and authorized

users (or services) can interact with resources.Why it matches: Identity has become the primary security perimeter in cloud environments. MFA requires users to provide multiple forms of verification before gaining access, directly strengthening this layer against compromised passwords, credential stuffing, and phishing attacks.

3. Surveillance camera $\rightarrow$ Physical securityThe Layer: The Physical security layer is the outermost barrier of defense-in-depth. It involves protecting the physical assets — such as data center buildings, server racks, and network cabling — from unauthorized physical access, theft, or damage.Why it matches: A surveillance camera acts as both a physical deterrent and a monitoring mechanism to protect the tangible facility itself. If an attacker cannot physically enter the data center, they cannot physically tamper with the disks or hardware.

Question: 428 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The Hot access tier is available for blob data that uses standard storage.	○	○
The Cool access tier is available for file shares in premium storage.	○	○
The Cool access tier can be configured at the storage account level.	○	○

Answer:

Answer Area

Statements	Yes	No
The Hot access tier is available for blob data that uses standard storage.	●	○
The Cool access tier is available for file shares in premium storage.	○	●
The Cool access tier can be configured at the storage account level.	●	○

Explanation:

Answer: Yes
Standard storage accounts support different online access tiers tailored to data usage patterns. The **Hot access tier** is optimized for storing data that is accessed or modified frequently. It features higher storage costs but the lowest data access/transaction costs among standard online tiers.

Answer: No
Premium storage accounts use Solid-State Drives (SSDs) designed for high performance, low-latency workloads and do not utilize standard blob-style online tiers like Cool or Archive. For file services, **Premium Azure File Shares** are provisioned at a specific high-performance tier with fixed limits. The Cool (and Hot)

tiers for file shares are exclusively features of standard performance storage accounts.

Answer: Yes
When you create or modify a General Purpose v2 (GPv2) or Blob Storage account, you can set a default **Access Tier** (Hot or Cool) at the root level of the entire storage account. Any new blob uploaded to that account will automatically inherit that tier unless you explicitly specify a different tier for that specific blob.

Question: 429 CertyIQ

Which two features or services can be integrated with Azure Monitor? Each correct answer presents part of the solution.
NOTE: Each correct answer is worth one point.

A.Azure status
B.Application Insights
C.Azure Advisor
D.Log Analytics
E.Azure Service Health

Answer: BD

Explanation:

B. Application Insights: This is an extension of Azure Monitor that provides deep Application Performance Management (APM). It allows you to monitor live web applications, automatically detecting performance anomalies, logging exceptions, and tracking user behavior telemetry natively within Azure Monitor.

D. Log Analytics: This is the primary tool and repository within Azure Monitor used to edit, run, and analyze log queries against data collected from various cloud resources. All log data ingested into Azure Monitor is stored and queried in a Log Analytics workspace.

Question: 430 CertyIQ

What provides a unified way to project and manage non-Azure resources in Azure Resource Manager (ARM)?

A.Azure Migrate
B.Azure AD Connect
C.Azure Arc
D.Azure Front Door

Answer: C

Explanation:

C. Azure Arc.

Azure Arc is explicitly designed to extend Azure management, governance, and services to infrastructure outside of Azure.

It works by installing an agent on non-Azure resources (such as on-premises physical servers, virtual machines in AWS or GCP, or external Kubernetes clusters). Once the agent is installed, these external resources are projected as native resource objects inside Azure Resource Manager (ARM). This allows you to manage them, apply tags, and enforce Azure Policies just as if they were running natively inside Azure.

https://learn.microsoft.com/EN-us/azure/azure-arc/servers/manage-vm-extensions-template

Question: 431

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
AzCopy is a command-line utility used to copy blobs or files to or from a storage account.	○	○
Azure Storage Explorer is a cloud-hosted migration service used to transfer large amounts of data.	○	○
Azure File Sync syncs files and folders between Azure Files and Windows file servers.	○	○

Answer:

Answer Area

Statements	Yes	No
AzCopy is a command-line utility used to copy blobs or files to or from a storage account.	●	○
Azure Storage Explorer is a cloud-hosted migration service used to transfer large amounts of data.	○	●
Azure File Sync syncs files and folders between Azure Files and Windows file servers.	●	○

Explanation:

YNY It´s correctAzCopy is a command-line utility that you can use to copy blobs or files to or from a storage accounthttps://learn.microsoft.com/en-us/azure/storage/common/storage-use-azcopy-v10Microsoft Azure Storage Explorer is a standalone app that makes it easy to work with Azure Storage data on Windows, macOS, and Linux. "https://learn.microsoft.com/en-us/azure/vs-azure-tools-storage-manage-with-storage-explorer?tabs=windows"

Question: 432

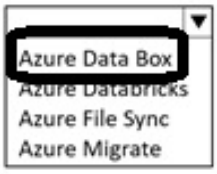
CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

[▼] is a physical migration service used to transfer large amounts of data in a quick, inexpensive, and reliable way.

- Azure Data Box
- Azure Databricks
- Azure File Sync
- Azure Migrate

Answer:



is a physical migration service used to transfer large amounts of data in a quick, inexpensive, and reliable way.

Explanation:

Azure Data Box is correct "The Microsoft Azure Data Box cloud solution lets you send terabytes of data into and out of Azure in a quick, inexpensive, and reliable way."

https://learn.microsoft.com/en-us/azure/databox/data-box-overview

Question: 433 CertyIQ

Your company has an Azure subscription and three business units.
You plan to deploy new resources for each business unit.
You need to ensure that the new resources are deployed by using a repeatable and reliable method that applies the same configurations to each resource.
What should you use?

A.Azure Policy
B.Azure Arc
C.a resource group
D.Azure Resource Manager (ARM) templates

Answer: D

Explanation:

The correct answer is D. Azure Resource Manager (ARM) templates.

ARM templates are JavaScript Object Notation (JSON) files that define the infrastructure and configuration for your project. They use Infrastructure as Code (IaC), which allows you to define what you want to deploy in a declarative way.

Because the configuration is defined in a file, you can reuse that same template to deploy resources across multiple business units. This directly satisfies the requirement for a repeatable and reliable method that ensures the exact same configurations are applied every time.

Question: 434 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
ExpressRoute uses Border Gateway Protocol (BGP).	○	○
ExpressRoute uses the internet to connect an on-premises network to Azure.	○	○
You can configure multiple ExpressRoute circuits to connect an on-premises datacenter to Azure.	○	○

Answer:

Answer Area

Statements	Yes	No
ExpressRoute uses Border Gateway Protocol (BGP).	●	○
ExpressRoute uses the internet to connect an on-premises network to Azure.	○	●
You can configure multiple ExpressRoute circuits to connect an on-premises datacenter to Azure.	●	○

Explanation:

YNY is correct introduction"Dynamic routing between your network and Microsoft via BGP."

https://learn.microsoft.com/en-us/answers/questions/633891/connecting-multiple-expressroute-circuit-with-a-si"Yes, it is possible. You can link a single virtual network with up to four ExpressRoute circuits in the same location or up to 16 ExpressRoute circuits in different peering locations.Reference : https://learn.microsoft.com/en-au/azure/expressroute/expressroute-faqs#can-i-have-one-virtual-network-connected-to-more-than-one-expressroute-circuitExpressRoutes don't go over the internet, hence ExpressRoute.Rather, it is strongly recommended that customers setup at least two ExpressRoute circuits to avoid single points of failure"

Reference:

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure Arc can manage physical servers that run Linux.	○	○
Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.	○	○
Azure Arc can manage a third-party database solution hosted outside of Azure.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Arc can manage physical servers that run Linux.	○	○
Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.	○	○
Azure Arc can manage a third-party database solution hosted outside of Azure.	○	○

Explanation:

Statement 1: Azure Arc can manage physical servers that run Linux.

Answer: Yes

Azure Arc-enabled servers allow you to connect physical or virtual machines hosted outside of Azure (such as on-premises data centers, AWS, or GCP) to Azure's control plane. By installing the Connected Machine agent on a physical server running Linux (or Windows), that machine becomes represented as a resource in Azure, allowing you to govern and monitor it using Azure tools.

Statement 2: Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.

Answer: Yes

Azure Arc-enabled Kubernetes allows you to attach and configure Kubernetes clusters both inside and outside of Azure. Specifically, when dealing with hybrid footprints or edge deployments (such as AKS on Azure Stack HCI or AKS Edge Essentials), Azure Arc acts as the centralized management pane to deploy GitOps configurations, enforce Azure Policies, and view cluster health at scale across your entire organization.

Statement 3: Azure Arc can manage a third-party database solution hosted outside of Azure.

Answer: No

Azure Arc-enabled data services are explicitly designed to bring Azure SQL Managed Instances and Azure Arc-enabled PostgreSQL to on-premises, edge, and multi-cloud environments via Kubernetes. It does not manage proprietary or arbitrary third-party database solutions (such as an on-premises Oracle database or a native AWS Amazon RDS instance) directly; it only extends Microsoft's own managed cloud database services to non-Azure infrastructure.

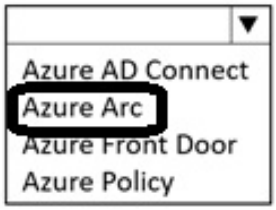
Question: 436 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

[▼] extends Azure compliance and monitoring to hybrid and multicloud configurations

- Azure AD Connect
- Azure Arc
- Azure Front Door
- Azure Policy

Answer:



extends Azure compliance and monitoring to hybrid and multicloud configurations

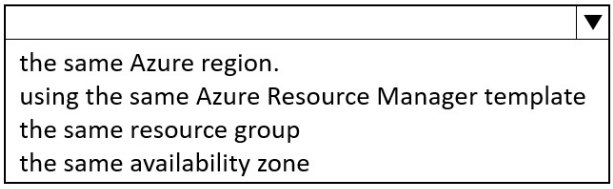
Explanation:

Azure Arc is a specialized management and governance plane designed to project non-Azure resources into the Azure Resource Manager (ARM) framework. This allows enterprises to operate hybrid, edge, and multi-cloud environments using unified cloud native tools.

Question: 437 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

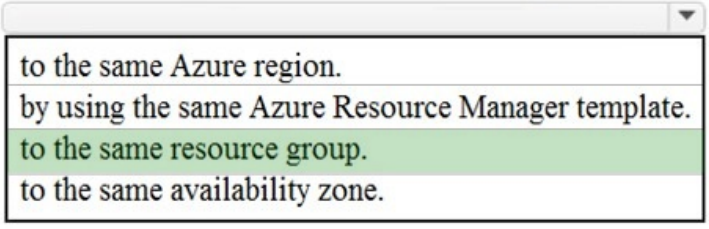
When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines



Answer:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines



Explanation:

A resource group is a logical container for Azure resources. Resource groups make the management of Azure resources easier.

With a resource group, you can allow a user to manage all resources in the resource group, such as virtual machines, websites, and subnets. The permissions you apply to the resource group apply to all resources contained in the resource group.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups
https://docs.microsoft.com/en-us/azure/role-based-access-control/overview

Question: 438 CertyIQ

Where does Azure Monitor store event data?

A.an Azure Blob Storage account
B.Azure Storage Queue
C.Azure SQL Database
D.a Log Analytics workspace

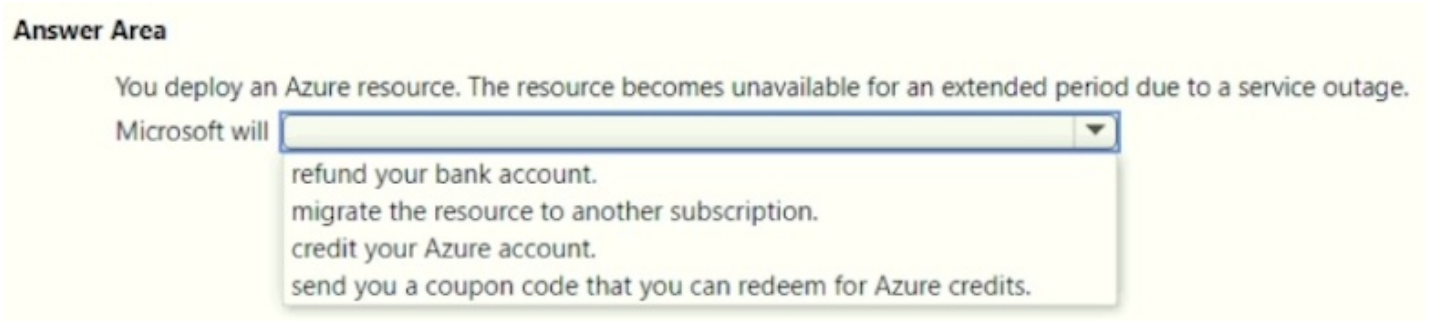
Answer: D

Explanation:

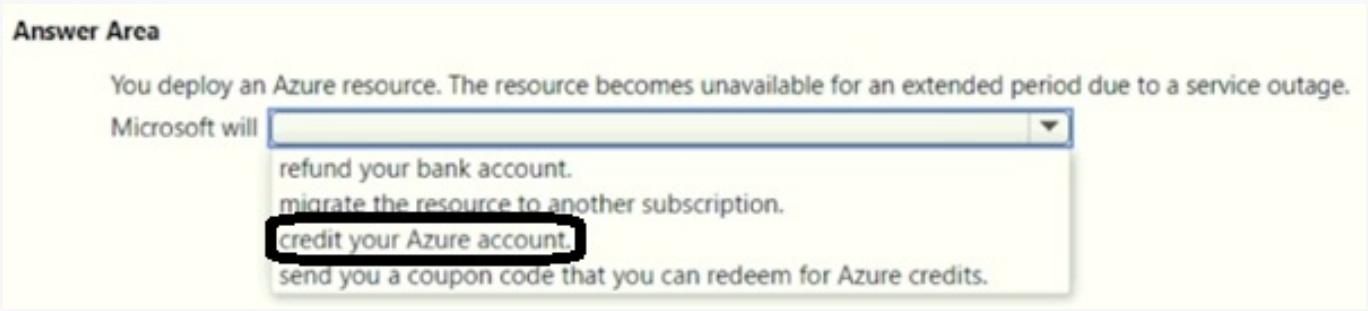
D. a Log Analytics workspace Azure Monitor stores event data in a Log Analytics workspace. This is a unique environment for Azure Monitor log data, where you can use Log Analytics to analyse collected data across sources. Each workspace has its own data repository and configuration, and data sources and solutions are configured to store their data in a workspace.

Question: 439 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:



Explanation:

You deploy an Azure resource. The resource becomes unavailable for an extended period due to a service outage. Microsoft will credit your Azure account.

Question: 440 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure,
- reduce the number of connections to the website.

Answer:

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- **pay monthly usage costs.**
- pay to transfer all the website data to Azure,
- reduce the number of connections to the website.

Explanation:

Public cloud platforms like Azure run entirely on a consumption-based utility scheme. Instead of paying massive upfront costs for physical hardware, infrastructure racks, and server components that you have to depreciate over years, you pay only for the resources you actively consume. These are aggregated and billed as monthly usage costs.

Question: 441

CertyIQ

HOTSPOT

-

Select the answer that correctly completes the sentence.

Answer Area

If a resource group named RG1 has a delete lock, _____ can delete RG1.

- only a member of the global administrators group
- the delete lock must be removed before an administrator
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Answer:

Answer Area

If a resource group named RG1 has a delete lock, _____ can delete RG1.

- only a member of the global administrators group
- **the delete lock must be removed before an administrator**
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Explanation:

delete lock must be removed before an administrator .

Question: 442

CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer:

Explanation:

Azure Resource Management Templates provide.

Question: 443

CertyIQ

An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Which three computers can run the script? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A.a computer that runs Windows 11 and has the Azure CLI tools installed
B.a computer that runs Linux and has the Azure CLI tools installed
C.a computer that runs macOS and has PowerShell Core 6.0 installed
D.a computer that runs Chrome OS and uses Azure Cloud Shell
E.a computer that runs Windows 10 and has the Azure PowerShell module installed

Answer: CDE

Explanation:

C. A computer that runs macOS and has PowerShell Core 6.0 installed.

PowerShell Core 6.0 is cross-platform and can run on macOS. If the Azure PowerShell module is also installed, this computer can run the script.

D. A computer that runs Chrome OS and uses Azure Cloud Shell.

Azure Cloud Shell supports both Bash and PowerShell. If the Cloud Shell is configured to use PowerShell, it can run the script.

E. A computer that runs Windows 10 and has the Azure PowerShell module installed.

Windows 10 supports PowerShell, and with the Azure PowerShell module installed, it can run the script to create Azure resources.

Question: 444 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure AD requires domain controllers on Azure virtual machines.	○	○
Azure AD provides authentication services for Azure and Microsoft 365.	○	○
Each user account in Azure AD can be assigned only one Microsoft 365 license.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure AD requires domain controllers on Azure virtual machines.	○	●
Azure AD provides authentication services for Azure and Microsoft 365.	●	○
Each user account in Azure AD can be assigned only one Microsoft 365 license.	○	●

Explanation:

Statement 1: Azure AD requires domain controllers on Azure virtual machines.

Answer: No

Explanation: Azure AD is a cloud-native, identity-as-a-service (IdaaS) platform. Unlike traditional on-premises Active Directory Domain Services (AD DS), it does not rely on a structural backbone of physical or virtualized domain controllers (DCs) running Windows Server. Microsoft handles the entire underlying scaling and infrastructure natively; you simply consume directory capabilities over the web.

Statement 2: Azure AD provides authentication services for Azure and Microsoft 365.

Answer: Yes

Explanation: Azure AD serves as the central identity engine and trust provider for Microsoft's entire cloud landscape. When a user tries to access the Azure Portal, connect to an Exchange Online mailbox, or open Microsoft Teams, Azure AD handles user authentication, evaluates Conditional Access policies, and issues security tokens.

Statement 3: Each user account in Azure AD can be assigned only one Microsoft 365 license.

Answer: No

Explanation: A single identity object in Azure AD can be assigned multiple licenses concurrently. For example, a specialized user could simultaneously hold a Microsoft 365 E5 license for their core productivity suite, a standalone Power BI Premium license for advanced data analytics, and an individual Dynamics 365 license for CRM access

Question: 445 CertyIQ

In the infrastructure as a service (IaaS) cloud service model, which two components are the responsibility of the cloud service provider? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A.the configuration and maintenance of storage
B.the installation and configuration of the operating system
C.maintaining the hardware
D.the network configuration
E.physical security of the datacenter infrastructure

Answer: CE

Explanation:

C. maintaining the hardware (Correct): The provider is responsible for purchasing, racking, power-cycling, and repairing the physical servers, blades, memory modules, and physical storage host arrays that sit inside their data centers.

E. physical security of the datacenter infrastructure (Correct): The provider owns the physical security boundary. This includes biometric access controls, security cameras, perimeter fencing, onsite guards, and environmental protections (like fire suppression and cooling) to ensure unauthorized personnel cannot gain physical access to the hosts running your data.

Question: 446 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

The Cool access tier is optimized

- for data that is accessed infrequently and stored for at least 30 days.
- for data that is accessed rarely, is stored for at least 180 days, and has flexible latency requirements.
- for storing data that is accessed frequently.

Answer:

Answer Area

The Cool access tier is optimized

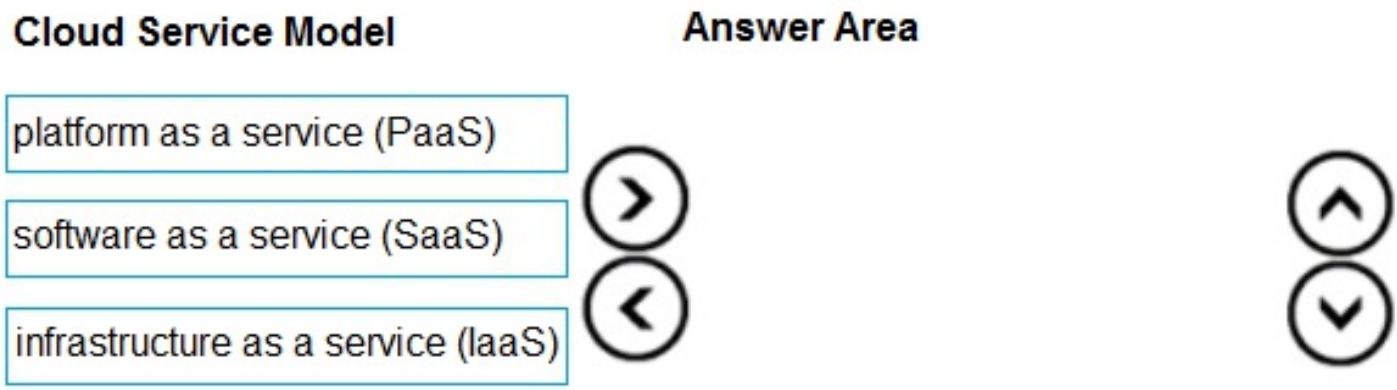
- for data that is accessed infrequently and stored for at least 30 days.
- for data that is accessed rarely, is stored for at least 180 days, and has flexible latency requirements.
- for storing data that is accessed frequently.

Explanation:

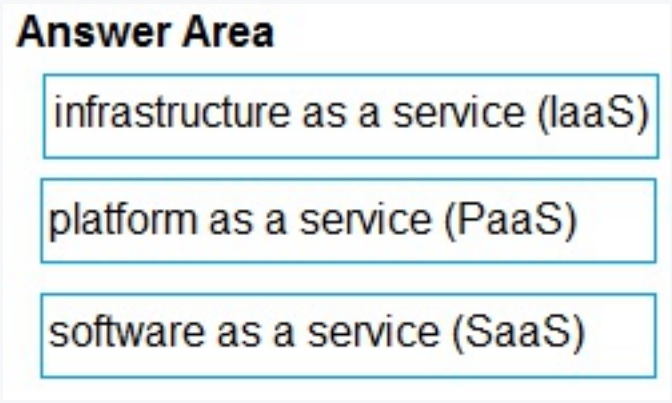
For data that is accessed infrequently and stored for at least 30 days.

Question: 447 CertyIQ

DRAG DROP
-
You need to identify a customer's level of shared responsibility based on the cloud service model.
In which order should you list each model from most customer responsibility to least customer responsibility? To answer, move all models from the list of models to the answer area and arrange them in the correct order.



Answer:



Explanation:

Infrastructure as a Service (IaaS)

Platform as a Service (PaaS)

Software as a Service (SaaS)

Question: 448 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
For the platform as a service (PaaS) cloud service, updating the operating system is the responsibility of the customer.	◯	◯
For the infrastructure as a service (IaaS) cloud service, network control is the responsibility of Microsoft.	◯	◯
For the software as a service (SaaS) cloud service, identity management is a shared responsibility between the customer and Microsoft.	◯	◯

Answer:

Answer Area

Statements	Yes	No
For the platform as a service (PaaS) cloud service, updating the operating system is the responsibility of the customer.	◯	◯
For the infrastructure as a service (IaaS) cloud service, network control is the responsibility of Microsoft.	◯	◯
For the software as a service (SaaS) cloud service, identity management is a shared responsibility between the customer and Microsoft.	◯	◯

Question: 449

CertyIQ

HOTSPOT

-

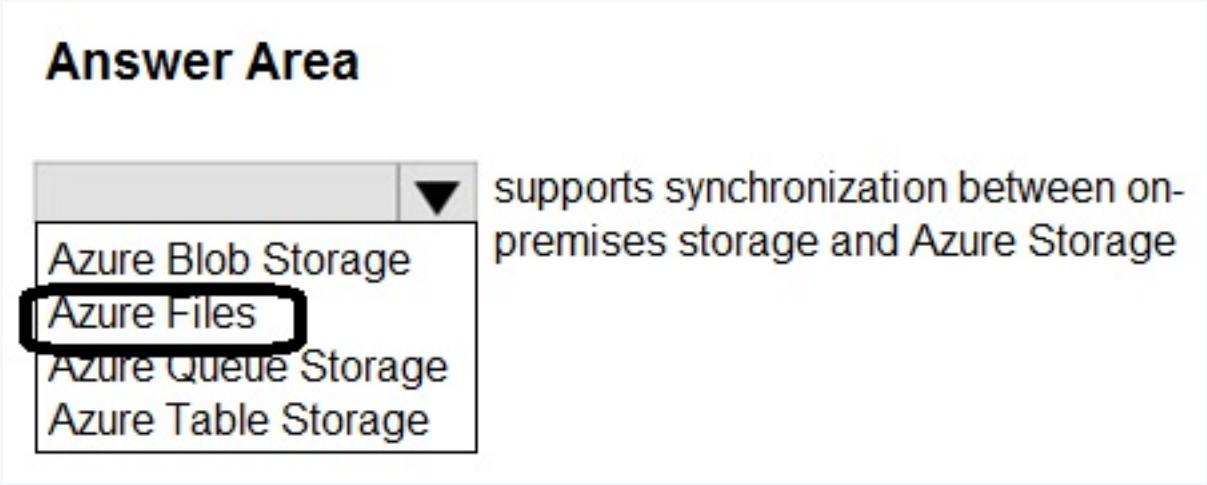
Select the answer that correctly completes the sentence.

Answer Area

[ ] supports synchronization between on-premises storage and Azure Storage

- Azure Blob Storage
- Azure Files
- Azure Queue Storage
- Azure Table Storage

Answer:



Explanation:

Azure Files supports synchronization between on-premises storage and Azure Storage.

Full Technical Breakdown

The capability highlighted in this question refers to a native synchronization service called Azure File Sync. This service extends the capabilities of Azure Files to transform your on-premises Windows Servers into a local, high-speed cache for your cloud file shares.

Question: 450 CertyIQ

You have an Azure Storage account named storage1.
You need to ensure that containers can be created in, but not deleted from, storage1.
What should you do?

A.Create a ReadOnly lock for storage1.
B.Create a delete lock for storage1.
C.Enable container soft delete.
D.Enable blob soft delete.

Answer: B

Explanation:

Create a delete lock for storage1.

Question: 451

CertyIQ

You have an Azure subscription.
You need to use Azure Cloud Shell to run a deployment script.
What should you use to access Cloud Shell?

A.Azure Resource Manager (ARM)
B.Microsoft Visual Studio
C.a Windows command prompt
D.a web browser

Answer: D

Explanation:

Correct answer is D:a web browser.

Question: 452

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Adding more RAM to a virtual machine is an example of Horizontal scaling.	◯	◯
Adding an additional virtual machine based upon demand is an example of Vertical scaling.	◯	◯
Horizontal scaling can occur automatically or manually.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Adding more RAM to a virtual machine is an example of Horizontal scaling.	◯	◉
Adding an additional virtual machine based upon demand is an example of Vertical scaling.	◯	◉
Horizontal scaling can occur automatically or manually.	◉	◯

Question: 453 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Creating and configuring a virtual network is part of the platform as a service (PaaS) cloud service model.	○	○
In the platform as a service (PaaS) cloud service model, updating code for an Azure web app is the customer's responsibility.	○	○
Configuring user access to a platform as a service (PaaS) cloud service model is the customer's responsibility.	○	○

Answer:

Answer Area

Statements	Yes	No
Creating and configuring a virtual network is part of the platform as a service (PaaS) cloud service model.	○	◯
In the platform as a service (PaaS) cloud service model, updating code for an Azure web app is the customer's responsibility.	◯	○
Configuring user access to a platform as a service (PaaS) cloud service model is the customer's responsibility.	◯	○

Explanation:

No

yes

yes

Question: 454 CertyIQ

You need to migrate an on-premises server by using a lift-and-shift migration.
To which type of cloud service should you migrate?

A.infrastructure as a service (IaaS)
B.software as a service (SaaS)
C.platform as a service (PaaS)

Answer: A

Explanation:

A. infrastructure as a service (IaaS)

Rehosting Concept: A lift-and-shift migration (also called rehosting) means moving an on-premises physical or virtual server to the cloud exactly as-is, without altering its code or architecture.
Exact Fit for IaaS: Infrastructure as a Service provides virtual machines (VMs), storage, and networking. This directly mimics your on-premises datacenter hardware, allowing you to replicate your existing server setup identically in the cloud.

Question: 455 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Only one tag can be assigned to an Azure resource.	○	○
Tags can be assigned to Azure resources by using Azure Resource Manager (ARM) templates.	○	○
Tags can be used to enforce naming standards for Azure resources.	○	○

Answer:

Answer Area

Statements	Yes	No
Only one tag can be assigned to an Azure resource.	○	●
Tags can be assigned to Azure resources by using Azure Resource Manager (ARM) templates.	●	○
Tags can be used to enforce naming standards for Azure resources.	○	●

Explanation:

No

Yes

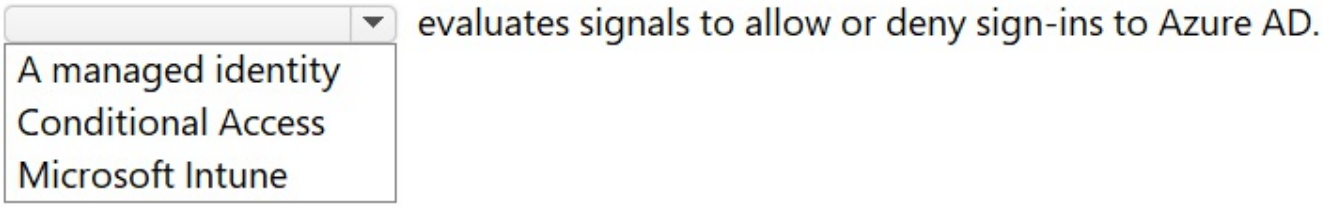
No

Question: 456 CertyIQ

HOTSPOT

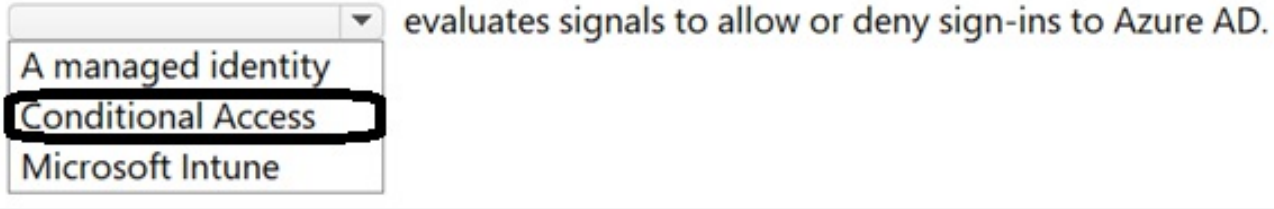
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

Conditional Access is the foundational policy engine at the core of Microsoft's Zero Trust identity architecture. It functions as an automated "if-then" statement matcher that aggregates real-time metrics before granting access to corporate resources.

Question: 457 CertyIQ

DRAG DROP
-
Match the Azure compute services to the appropriate descriptions.
To answer, drag the appropriate compute service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.

Compute services	Answer Area	
Azure App Service		Provides software emulation of a physical computer.
Azure Container Instances		Provides operating system virtualization.
Azure Functions		
Azure Virtual Machine Scale Sets		

Answer:

Answer Area

Azure Container Instances	Provides software emulation of a physical computer.
Azure Virtual Machine Scale Sets	Provides operating system virtualization.

Explanation:

Azure Container Instances .

Azure Virtual Machines scale Sets.

Question: 458 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure Advisor supports alerts.	○	○
Azure Advisor recommendations can be filtered by Administrative unit.	○	○
Azure Advisor provides recommendations on improving the performance of resources.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Advisor supports alerts.	●	○
Azure Advisor recommendations can be filtered by Administrative unit.	○	●
Azure Advisor provides recommendations on improving the performance of resources.	●	○

Explanation:

Statement 1: Azure Advisor supports alerts.

Answer: Yes

Azure Advisor integrates natively with Azure Monitor Alerts. This allows you to configure automated notification thresholds so that the moment a critical new recommendation is generated — such as a critical security vulnerability or an urgent cost-saving opportunity — an alert fires to notify engineering teams via email, SMS, push notifications, or webhooks.

Statement 2: Azure Advisor recommendations can be filtered by Administrative unit.

Answer: No

Administrative Units (AUs) are a logical container feature specific to Microsoft Entra ID used strictly for delegating administrative control over user accounts, groups, and device objects. Azure Advisor, on the other hand, operates within the Azure Resource Manager (ARM) scope hierarchy. Consequently, Advisor recommendations can be filtered by subscriptions, resource groups, workload tags, or recommendation status —not by identity directory boundaries like Administrative Units.

Statement 3: Azure Advisor provides recommendations on improving the performance of resources.

Answer: Yes

Performance is one of the five core pillars of the Microsoft Well-Architected Framework that Azure Advisor continuously evaluates. It monitors asset metrics (such as CPU, network bottlenecks, disk performance, or outdated database configurations) and surfaces actionable optimization recommendations to improve responsiveness, enhance throughput, or resolve critical resource constraints.

Question: 459 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You must install Azure Cloud Shell on your computer before you can use it.	○	○
The Azure Command-Line Interface (CLI) is installed by default in Windows 11.	○	○
Azure PowerShell can be used on computers that run Windows, Linux, or macOS.	○	○

Answer:

Answer Area

Statements	Yes	No
You must install Azure Cloud Shell on your computer before you can use it.	○	●
The Azure Command-Line Interface (CLI) is installed by default in Windows 11.	○	●
Azure PowerShell can be used on computers that run Windows, Linux, or macOS.	●	○

Explanation:

Statement 1: You must install Azure Cloud Shell on your computer before you can use it.

Answer: No

Explanation: Azure Cloud Shell is a browser-accessible, cloud-hosted terminal environment managed entirely by Microsoft. It requires absolutely zero local installation on your workstation. You simply launch it directly within the Azure Portal, through shell.azure.com, or via mobile apps, and it handles provisioning a temporary container pre-configured with standard command-line tools.

Statement 2: The Azure Command-Line Interface (CLI) is installed by default in Windows 11.

Answer: No

Explanation: Windows 11 ships with standard administrative command-line tools like Command Prompt and Windows PowerShell, but it does not come with the Azure CLI built-in. To execute az commands locally on your machine, you must explicitly download and run the MSI installer, or deploy it via package managers such as Winget (winget install Microsoft.AzureCLI).

Statement 3: Azure PowerShell can be used on computers that run Windows, Linux, or macOS.

Answer: Yes

Question: 460 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in a datacenter.	○	○
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in Azure.	○	○
The Total Cost of Ownership (TCO) Calculator generates graphical reports.	○	○

Answer:

Answer Area

Statements	Yes	No
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in a datacenter.	○	○
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in Azure.	○	○
The Total Cost of Ownership (TCO) Calculator generates graphical reports.	○	○

Explanation:

Statement 1: The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in a datacenter.

Answer: No

Explanation: The purpose of the TCO Calculator is not to act as an independent estimator for on-premises data center operations. Instead, it is a migration comparison tool. While you do input your current data center infrastructure configurations (such as server specs, storage, labor, and electricity costs), it uses that data as a baseline to demonstrate how much money you would save by migrating those assets to Azure over a designated time horizon.

Statement 2: The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in Azure.

Answer: Yes

Explanation: To show financial differentiation, the TCO Calculator maps your baseline on-premises infrastructure inputs directly to equivalent Azure service configurations (such as Azure VMs, Azure Storage,

and Azure SQL). It then displays the projected costs of running those workloads in Azure so that you can directly compare cloud expenditures against on-premises overhead.

Statement 3: The Total Cost of Ownership (TCO) Calculator generates graphical reports.

Answer: Yes

Explanation: Once all infrastructure baseline parameters and cloud options are configured, the TCO Calculator compiles the results into a comprehensive final report. This report includes broken-down graphical dashboards, cost-comparison charts, and visual tables mapping savings across specific cost categories (such as compute, storage, networking, labor, and virtualization software). These can be downloaded as a PDF report for executive presentations

Question: 461 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Network security groups (NSGs) can contain multiple inbound and outbound security rules.	◯	◯
A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.	◯	◯
A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Network security groups (NSGs) can contain multiple inbound and outbound security rules.	◉	◯
A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.	◉	◯
A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.	◯	◉

Explanation:

Statement 1: Network security groups (NSGs) can contain multiple inbound and outbound security rules.

Answer: Yes

An NSG acts as a basic packet-filtering firewall for your virtual network subnets or individual network interfaces (NICs). Within a single NSG, you can create multiple security rules (up to default limits, typically 1,000 rules per NSG). Each rule specifies a priority, source/destination, port, protocol, and an explicit action (Allow or Deny) for both incoming (inbound) and outgoing (outbound) traffic patterns.

Statement 2: A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.

Answer: Yes

A Network Virtual Appliance (NVA) is a specialized virtual machine image deployed directly into a virtual network. Instead of acting as a traditional server running standard applications, it is pre-configured to run

advanced networking functions — most commonly firewalls (such as Check Point, Palo Alto, or Fortinet), WAN optimizers, routers, or specialized load balancers.

Statement 3: A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.

Answer: No

While UDRs are frequently used to override system routing between subnets inside the same VNet (for example, forcing all traffic through an NVA firewall), they are not restricted to a single virtual network. UDRs can control out-of-network egress routing across a wide variety of boundaries, such as directing outbound traffic to an on-premises data center over a VPN Gateway/ExpressRoute, routing traffic out through a specific internet gateway, or directing traffic across interconnected networks via VNet Peering.

Question: 462 CertyIQ

Microsoft 365 is an example of which cloud service model?

A.infrastructure as a service (IaaS)
B.platform as a service (PaaS)
C.software as a service (SaaS)

Answer: C

Explanation:

C. software as a service (SaaS).

Microsoft 365 (formerly Office 365) provides cloud-based software applications like Word, Excel, Outlook, and Teams over the internet. With the SaaS model, Microsoft manages all the underlying infrastructure, middleware, and application software; users simply connect to and use the applications, typically through a web browser or locally installed software that is centrally managed via the cloud. This eliminates the need for users or organizations to worry about installation, maintenance, or management of the software or the infrastructure it runs on.

Question: 463 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure DNS only supports public DNS domain names.	○	○
Azure virtual machines can register names in Azure DNS automatically.	○	○
Azure DNS can host a custom DNS domain.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure DNS only supports public DNS domain names.	○	◉
Azure virtual machines can register names in Azure DNS automatically.	◉	○
Azure DNS can host a custom DNS domain.	◉	○

Explanation:

Statement 1: Azure DNS only supports public DNS domain names.

Answer: No

Azure DNS fully supports both public and private name resolution. While it can host internet-facing public domains, it also provides Azure DNS Private Zones. Private zones allow you to configure and resolve custom, internal domain names within a virtual network (VNet) or across interconnected VNets without exposing those records or traffic to the public internet.

Statement 2: Azure virtual machines can register names in Azure DNS automatically.

Answer: Yes

When you link an Azure DNS Private Zone to a virtual network, you can enable a built-in feature called auto-registration. Once activated, when a new virtual machine is spun up and joined to that VNet, Azure DNS automatically tracks its lifecycle and registers an 'A' (address) record matching the VM's hostname and its private IP address. It will also automatically clean up the record if the VM is deleted.

Statement 3: Azure DNS can host a custom DNS domain.

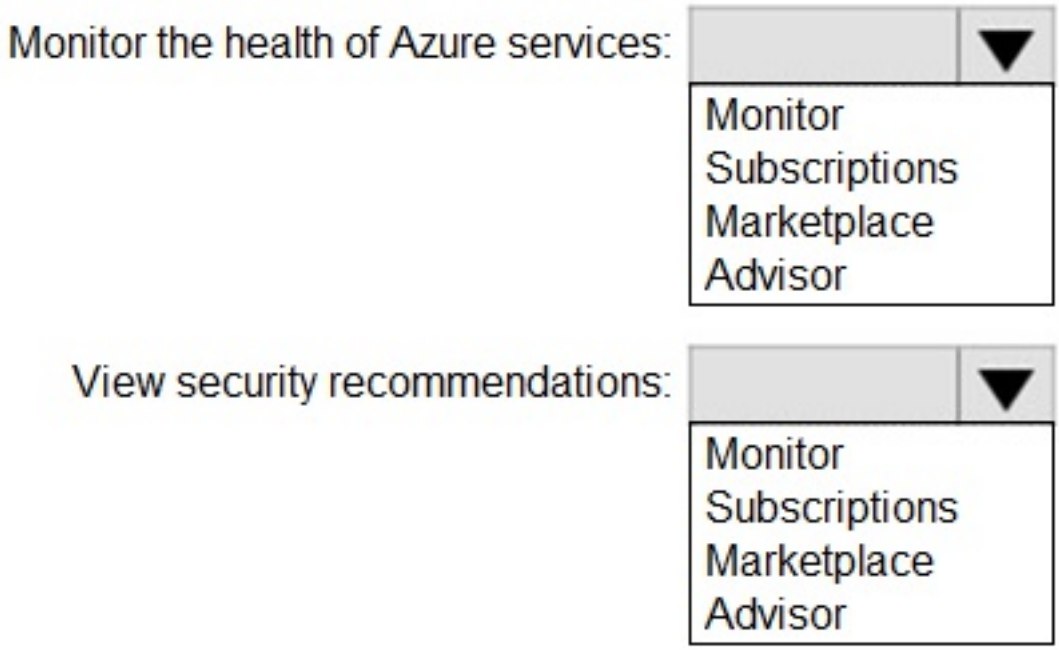
Answer: Yes

Azure DNS allows you to host your own custom registered domain name (such as contoso.com or mycompany.io). After you purchase a domain through a domain registrar, you simply create a DNS zone object in Azure and update your registrar's configuration to point to the designated Azure DNS name servers. This allows you to manage all of your custom DNS records natively using Azure portal menus, CLI tools, or ARM templates.

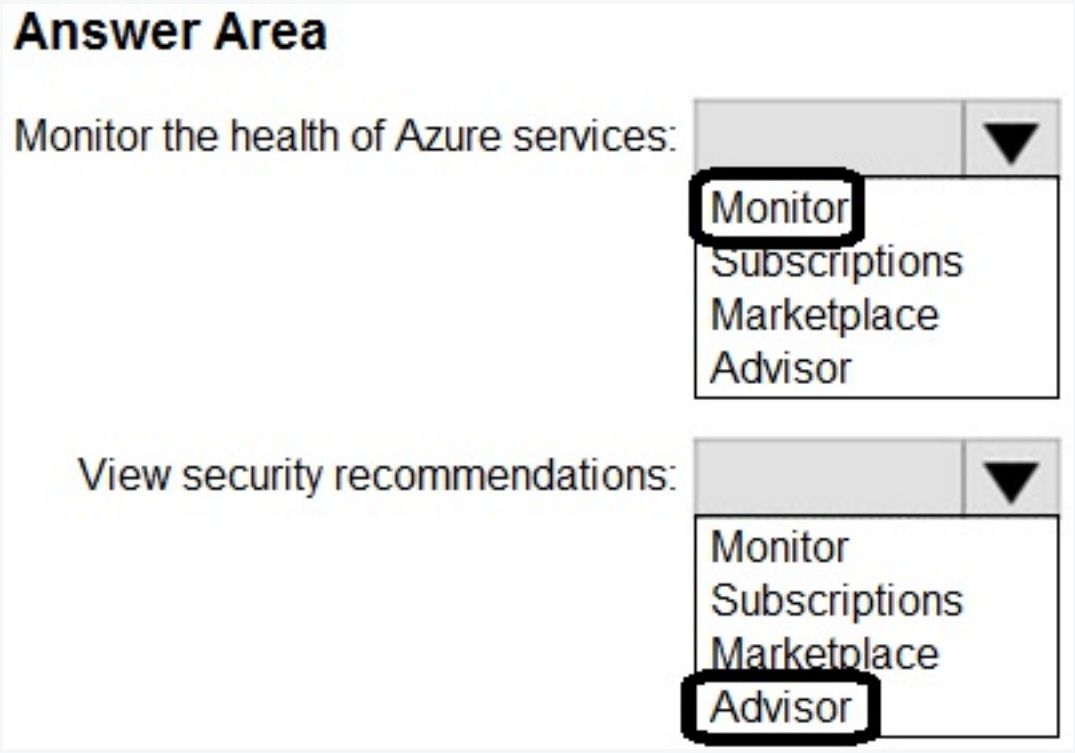
Question: 464 CertyIQ

HOTSPOT
-
You need to identify which blades in the Azure portal must be used to perform the following tasks:
•View security recommendations.
•Monitor the health of Azure services.
Which blade should you identify for each task? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer Area



Answer:



Explanation:

Dropdown 1: Monitor the health of Azure services $\rightarrow$ MonitorAzure Monitor is the centralized management hub for collecting, analyzing, and acting on telemetry from both your cloud and on-premises environments.Key Context: Within the Azure Monitor ecosystem, you can track infrastructure performance,

configure alerts, and gain direct access to Azure Service Health. Service Health keeps you continuously informed about global Azure service incidents, regional outages, planned infrastructure maintenance cycles, and specialized health advisories that specifically impact your running deployments.Dropdown

2: View security recommendations $\rightarrow$ Advisor Azure Advisor acts as a personalized, cloud-based optimization consultant that continuously analyzes your asset telemetry and resource configurations.Key Context: It compares your deployment patterns against the core tenets of the Microsoft Cloud Adoption Framework and Well-Architected Framework, surfacing specific actionable recommendations across five pillars: Security, Cost, Reliability, Operational Excellence, and Performance. Under the Security category, it integrates deeply with Microsoft Defender for Cloud to display crucial security hygiene recommendations (such as finding public-facing VMs missing standard network security groups or tracking unencrypted storage assets).

Question: 465

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The Cold access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Cool access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Archive access tier in Azure Storage is optimized for at least 180 days of data storage.	○	○

Answer:

Statements	Yes	No
The Cold access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Cool access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Archive access tier in Azure Storage is optimized for at least 180 days of data storage.	○	○

Explanation:

Statement 1: The Cold access tier in Azure Storage is optimized for at least 90 days of data storage.

Answer: No

The Cold access tier is a newer online storage tier positioned between Cool and Archive. It is explicitly optimized for storing data that is infrequently accessed or modified, with a minimum retention commitment of 30 days. Storing data in this tier for fewer than 30 days incurs an early deletion fee.

Statement 2: The Cool access tier in Azure Storage is optimized for at least 90 days of data storage.

Answer: No

Like the Cold tier, the Cool access tier is designed for short-to-medium-term storage of infrequently accessed data (such as backup datasets or telemetry logs). It also enforces a minimum duration profile of 30 days, rather than 90 days.

Statement 3: The Archive access tier in Azure Storage is optimized for at least 180 days of data storage.

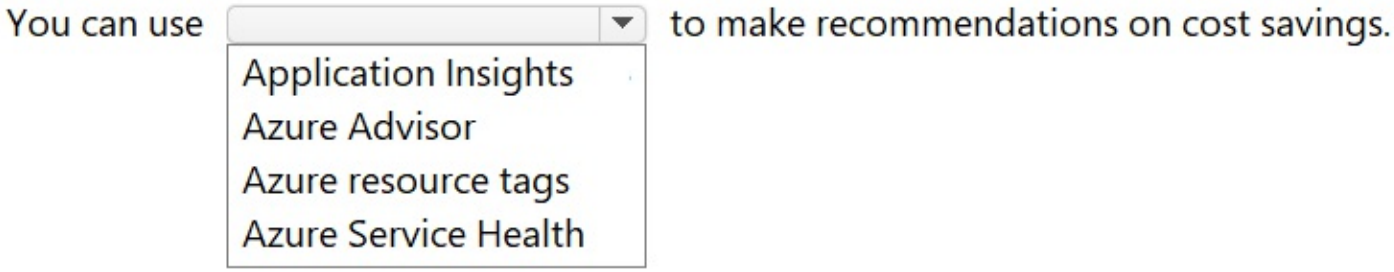
Answer: Yes

The Archive access tier is an offline tier optimized for rare-access baseline data, long-term compliance records, and legacy datasets. Because it offers the absolute lowest storage cost per gigabyte at the expense of higher data retrieval costs and latency (taking hours to rehydrate), Microsoft requires a long-term commitment. It is strictly optimized for a minimum of 180 days of continuous retention; deleting or moving blobs out of Archive prior to 180 days results in a prorated early deletion charge.

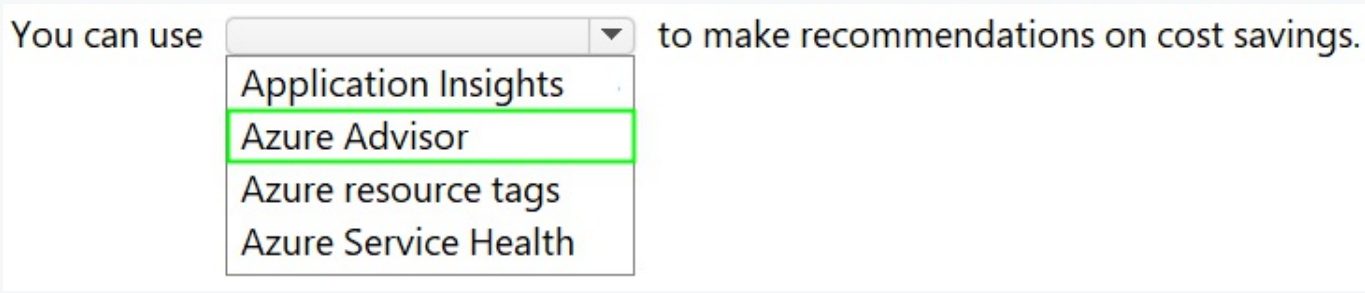
Question: 466 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

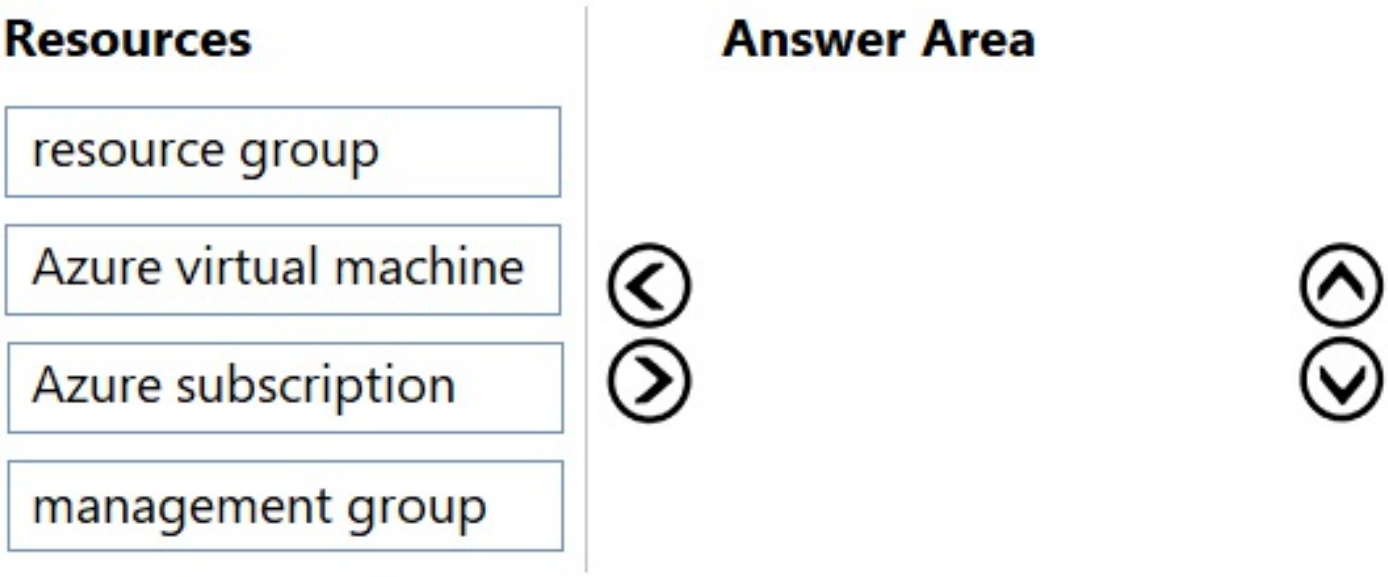


Explanation:

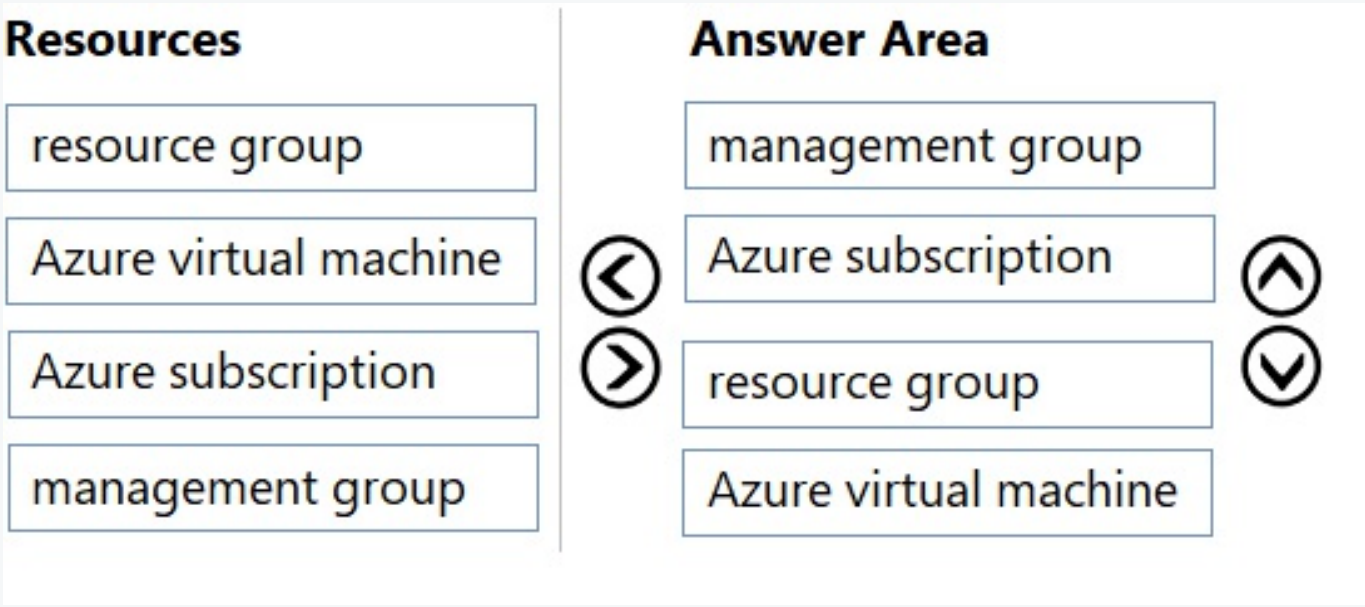
Azure Advisor is a cloud-based service provided by Microsoft Azure that offers personalized best practices recommendations to optimize Azure resources.

Question: 467 CertyIQ

DRAG DROP
-
In which order should you arrange the Azure resources from the highest parent object (top) to the lowest child object? To answer, move all resources from the list of resources to the answer area and arrange them in the correct order.



Answer:



Explanation:

Management group.

Azure subscription.

resource group.

Azure virtual machine.

Question: 468

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
A read-only lock prevents users from deleting an Azure resource.	○	○
Users can modify an Azure resource that has a delete lock applied.	○	○
All Azure resources inherit the locks assigned to their parent resource group.	○	○

Answer:

Statements	Yes	No
A read-only lock prevents users from deleting an Azure resource.	○	○
Users can modify an Azure resource that has a delete lock applied.	○	○
All Azure resources inherit the locks assigned to their parent resource group.	○	○

Explanation:

Statement 1: A read-only lock prevents users from deleting an Azure resource.

Answer: Yes

In Azure Resource Manager (ARM), a ReadOnly lock is the most restrictive lock type available. It acts as an absolute barrier that prevents authorized users from both deleting and modifying the targeted resource. Because it entirely prevents destructive actions, it inherently blocks deletion.

Statement 2: Users can modify an Azure resource that has a delete lock applied.

Answer: Yes

A CanNotDelete (Delete) lock restricts only the removal/deletion of an infrastructure asset. Unlike a read-only lock, it explicitly permits normal operational modifications, configuration adjustments, and property updates. For example, if you place a delete lock on a production database or virtual machine, engineers can still update scale settings, patch software, or adjust configurations, but any accidental attempt to terminate the resource will be blocked.

Statement 3: All Azure resources inherit the locks assigned to their parent resource group.

Answer: Yes

Azure Resource Manager locks enforce a strict top-down inheritance model. When you assign a lock at a higher organizational scope — such as a Management Group, an Azure Subscription, or a parent Resource Group — that lock automatically applies to every child resource existing within that boundary, as well as any new resources deployed into it later. A user cannot bypass a resource group lock at the individual resource level without administrative permissions to remove the lock from the parent scope first.

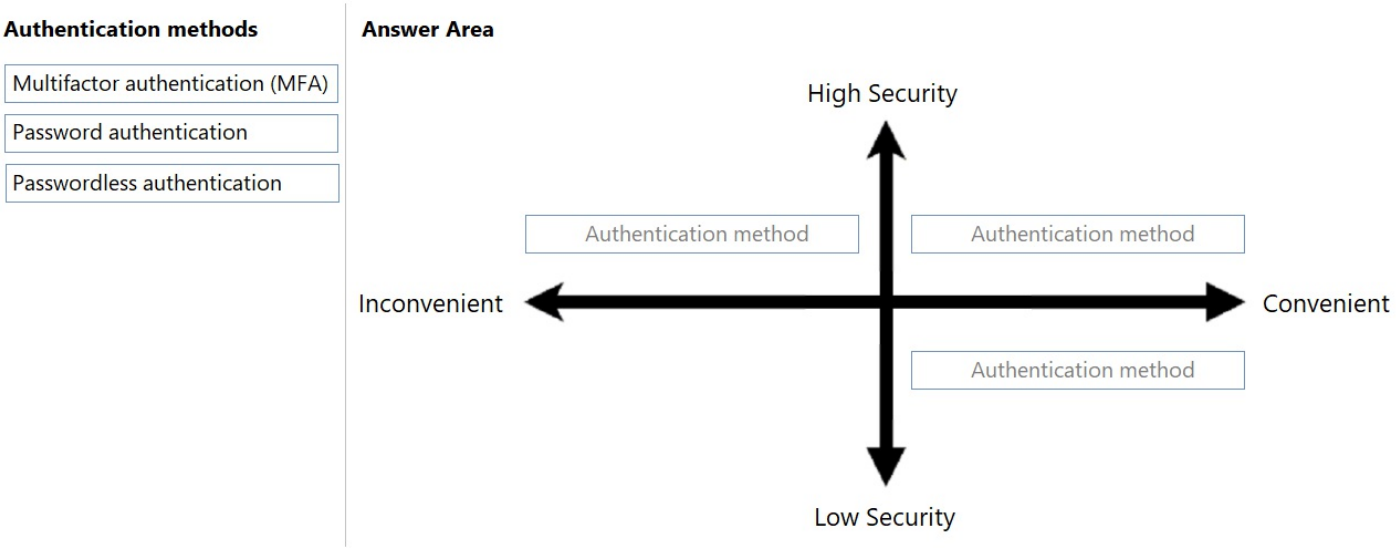
Question: 469 CertyIQ

DRAG DROP

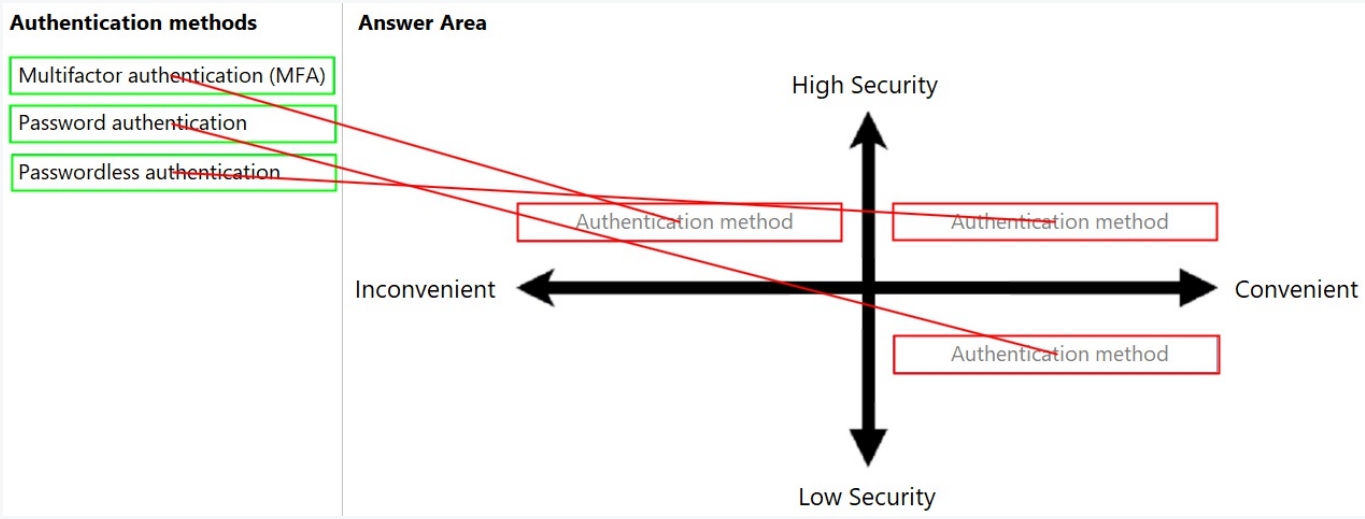
-

Match the authentication method to the appropriate level of security.

To answer, drag the appropriate authentication method from the column on the left to its level of security on the right.
NOTE: Each correct match is worth one point.



Answer:



Question: 470

CertyIQ

How many data copies are stored in gee-zone-redundant storage (GZRS)?

A.2
B.3
C.6
D.12

Answer: C

Explanation:

C. 6.

Geo-Zone-Redundant Storage (GZRS) combines the high availability of Zone-Redundant Storage (ZRS) with the regional disaster recovery protection of Geo-Redundant Storage (GRS). It replicates your data across a total of 6 copies split between two distinct geographic regions:

Question: 471 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

If you delete data from [ ] before 30 days has elapsed, you must pay an early deletion fee.

- an Azure Cosmos DB datastore
- Azure SQL Database
- the cool access tier of Azure Blob Storage
- the hot access tier of Azure Blob Storage

Answer:

If you delete data from [the cool access tier of Azure Blob Storage] before 30 days has elapsed, you must pay an early deletion fee.

Explanation:

The Cool Access Tier: This tier is designed for data that is infrequently accessed and expected to remain stored for at least 30 days. If a blob is deleted, overwritten, or moved to another tier before that 30-day window finishes, Azure charges a prorated early deletion fee equivalent to the remaining days of storage.

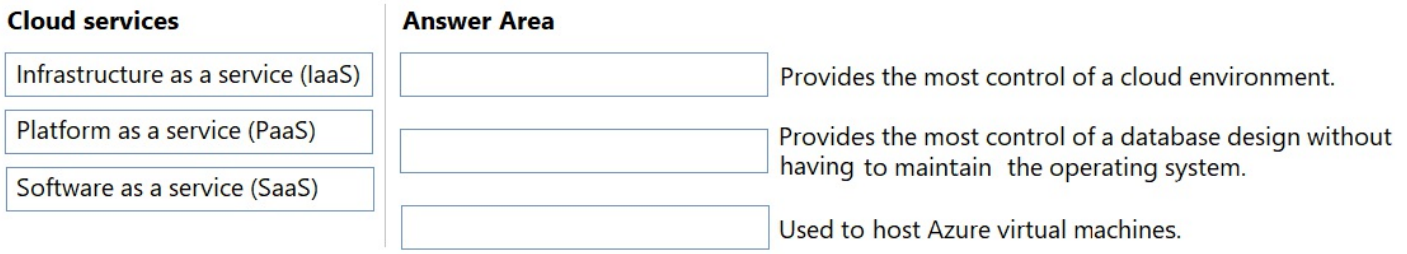
The Hot Access Tier: Optimized for frequent read/write access. It has no minimum storage duration requirement and charges no early deletion penalties, though its baseline storage cost per gigabyte is higher.

The Cold Access Tier: Optimized for even less frequent access than Cool, carrying a minimum storage duration commitment of 30 days.

The Archive Access Tier: An offline tier meant for long-term data retention. It carries a minimum duration commitment of 180 days.

Question: 472 CertyIQ

DRAG DROP
-
Match the cloud service to the appropriate description.
To answer, drag the appropriate cloud service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Explanation:

1. Provides the most control of a cloud environment. $\rightarrow$ Infrastructure as a service (IaaS)Explanation: Of all the cloud delivery models, IaaS grants you the maximum degree of administrative governance and architectural control. Because the cloud provider only provisions the physical hardware and virtualization hypervisor layer, you have full ownership from the operating system up. This means you control OS configurations, local security policies, installed runtimes, and deep networking adjustments.

2. Provides the most control of a database design without having to maintain the operating system. $\rightarrow$ Platform as a service (PaaS)Explanation: This is the quintessential definition of a database-oriented PaaS model (such as Azure SQL Database). The cloud provider completely abstracts away, automates, and maintains the underlying virtual machines, OS patches, physical storage allocation, and backups. This frees your engineering teams from infrastructure maintenance, allowing them to focus entirely on designing high-level database schemas, writing optimized SQL queries, indexing tables, and regulating data permissions.

3. Used to host Azure virtual machines. $\rightarrow$ Infrastructure as a service (IaaS)Explanation: When you spin up computing instances in the cloud, you are directly leveraging IaaS. You select the underlying computing specs (vCores, RAM) and your preferred operating system image (such as Windows Server or Ubuntu Linux). Once provisioned, that virtual disk space and OS environment belong entirely to you to manage, configure, and maintain over its operational lifecycle.

Question: 473 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

A cloud service provider's service-level agreement (SLA) expresses [ ] as a percentage of uptime over a given year.

availability
elasticity
reliability
scalability

Answer:

A cloud service provider's service-level agreement (SLA) expresses availability as a percentage of uptime over a given year.

availability
elasticity
reliability
scalability

Explanation:

A Service-Level Agreement (SLA) is a contract between a service provider and a customer that defines the expected level of service. In the context of cloud computing, one of the most important metrics defined in an SLA is uptime, and this is expressed as a percentage of availability over a given period, typically one year.

Question: 474 CertyIQ

What can you use to make recommendations that will reduce Azure costs?

A.Azure Advisor
B.Log Analytics
C.Azure Service Health
D.the Azure pricing calculator

Answer: A

Explanation:

Azure Advisor: Azure Advisor is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. It provides recommendations to reduce costs, improve performance, enhance security, and ensure high availability. For cost reduction specifically, Azure Advisor analyzes your resource configurations and usage patterns, then identifies opportunities to reduce your overall spend. This can include recommendations like resizing or shutting down underutilized resources, adopting reserved

instances, and more.

Thank you

Thank you for being so interested in the premium exam material.
I'm glad to hear that you found it informative and helpful.

If you have any feedback or thoughts on the bumps, I would love to hear them.
Your insights can help me improve our writing and better understand our readers.

Best of Luck

You have worked hard to get to this point, and you are well-prepared for the exam
Keep your head up, stay positive, and go show that exam what you're made of!
