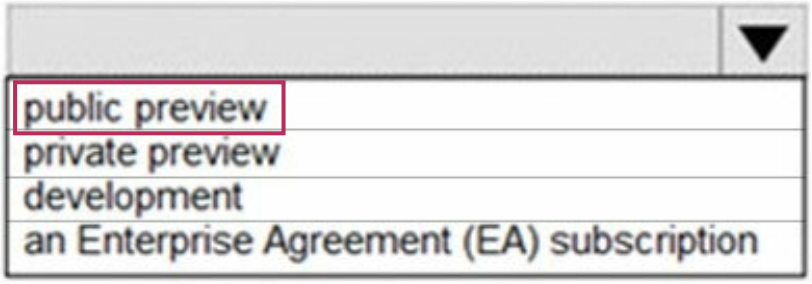
Answer Area

Azure Feature Lifecycle: Microsoft tests and releases Azure features and services through distinct lifecycle phases:

An Azure service is available to all Azure customers when it is in



Private Preview: Available exclusively to a select, targeted group of customers for early evaluation and direct engineering feedback; not accessible to the general public.

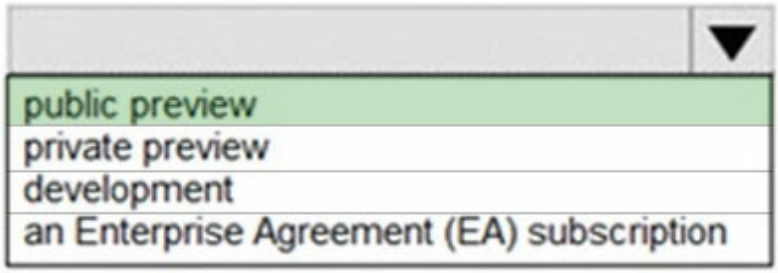
Public Preview: Made available to all Azure customers via the Azure portal or CLI/API to test pre-release functionality before formal production release (typically provided without financially backed SLAs).

General Availability (GA): Formally released for commercial use across all supported regions, backed by full production support and official SLAs.

Answer:

Answer Area

An Azure service is available to all Azure customers when it is in



Explanation:

Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Public previews are excluded from SLAs and in some cases, no support is offered.

Incorrect Answers:

Services in private preview are available only to selected people who has signed up to the private preview program.

- Services in development are not available to the public.
- Services provided under an Enterprise Agreement (EA) subscription are available only to the subscription owner.

Question: 311 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to purchase an Azure subscription.

The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.

You need to recommend which support plan meets the support policy requirement.

Solution: Recommend a Basic support plan.

Does this meet the goal?

A. Yes
B. No

The Basic support plan included with every Azure subscription covers only billing/subscription management support, service health access, and self-help documentation. It provides no technical support and no access to support engineers via phone or email.

Technical support access by phone or email requires at least a paid support tier:

Answer: B

Developer: Email-only technical support during business hours (no phone access).

Explanation:

Standard, Professional Direct, or Enterprise (Unified): 24/7 access to technical support engineers via both phone and email.

B. No

The Basic support plan typically offers limited support, such as access to documentation, community forums, and self-help resources. It does not include technical support for troubleshooting, advisory support, or support for service-level agreements (SLAs). If the support policy requirement includes direct technical support, faster response times, or other advanced support features, a higher-tier plan like Developer, Standard, Professional Direct, or Premier would be more appropriate. Therefore, recommending a Basic support plan does not meet the goal if the requirement includes more comprehensive support services.

The Basic support plan does not have any technical support for engineers.

Access to Support Engineers via email or phone is available in the following support plans: Premier, Professional Direct and standard.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Question: 312

CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to purchase an Azure subscription.
The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.
You need to recommend which support plan meets the support policy requirement.
Solution: Recommend a Standard support plan.
Does this meet the goal?

A. Yes
B. No

The Basic support plan included with every Azure subscription covers only billing/subscription management support, service health access, and self-help documentation. It provides no technical support and no access to support engineers via phone or email.

Technical support access by phone or email requires at least a paid support tier:

Developer: Email-only technical support during business hours (no phone access).

Answer: A

Explanation:

Standard, Professional Direct, or Enterprise (Unified): 24/7 access to technical support engineers via both phone and email.

The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

Reference:
https://azure.microsoft.com/en-gb/support/plans/

Question: 313 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company plans to purchase an Azure subscription.
The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.
You need to recommend which support plan meets the support policy requirement.
Solution: Recommend a Premier support plan.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:

The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Note:- The question is obsolete. Premier support is retired.

Question: 314 CertyIQ

Your company plans to request an architectural review of an Azure environment from Microsoft.
The company currently has a Basic support plan.
You need to recommend a new support plan for the company. The solution must minimize costs.
Which support plan should you recommend?

A. Premier
B. Developer
C. Professional Direct
D. Standard

Developer and Standard support plans only offer "General guidance" based on open documentation and best-practice guides (they do not provide dedicated architectural reviews of your specific environment).

Professional Direct ($1,000/month) provides tailored architectural reviews and advisory services delivered by a pool of ProDirect delivery managers (e.g., design guidance, optimization consultations, and Cloud Solution Architect-aligned advisory).

Premier / Unified Enterprise Support also includes architectural reviews, but at a significantly higher enterprise-tier price point.

Answer: C

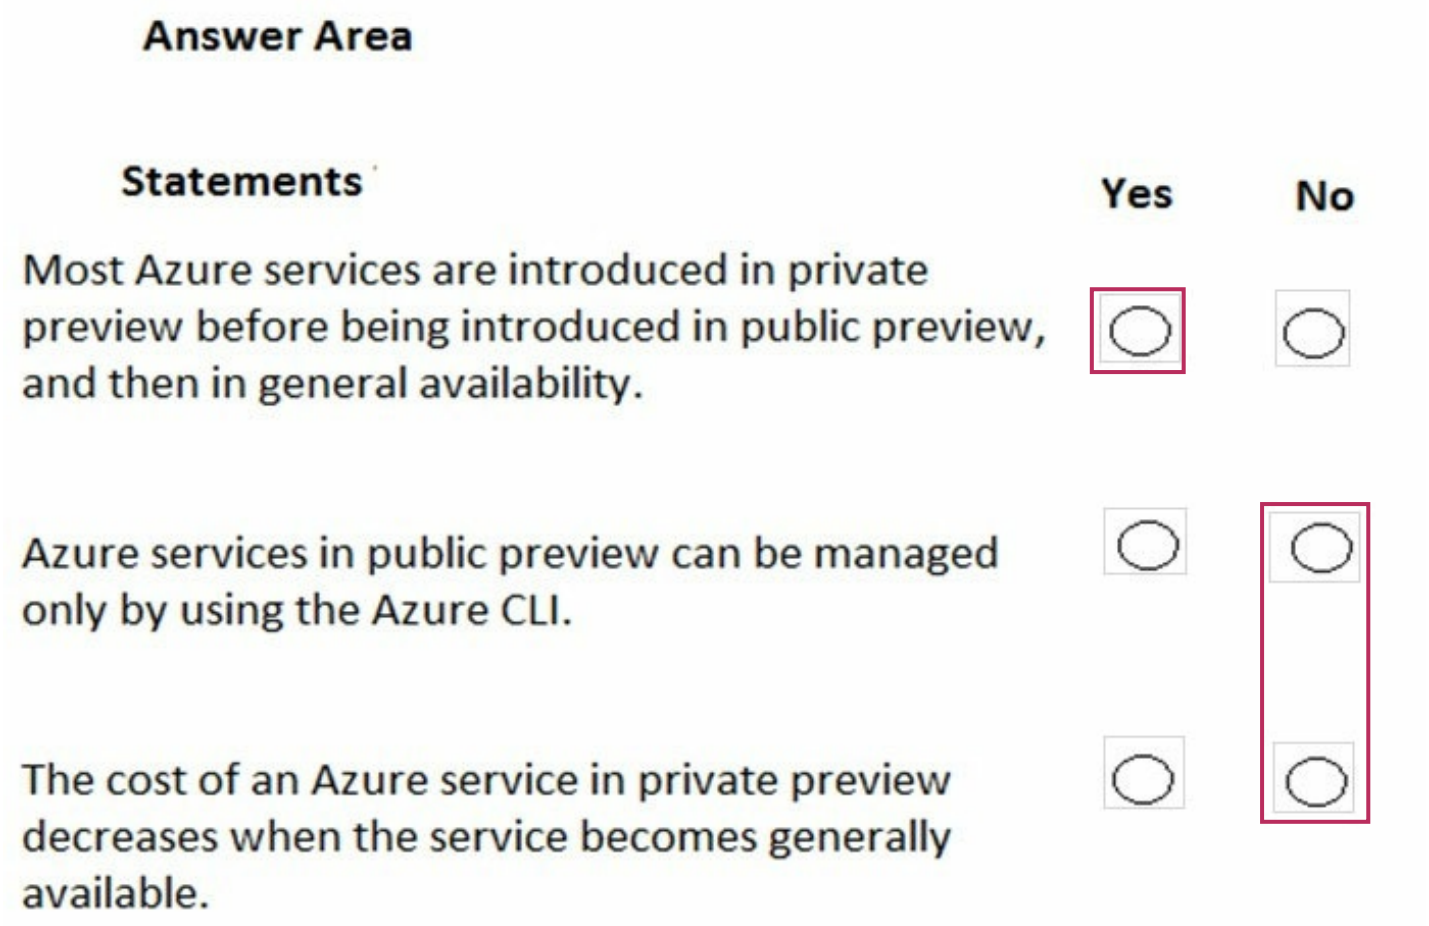
Explanation:

Professional Direct provide Guidance from a pool of ProDirect delivery managers. Developer and standard provide general guidance. https://azure.microsoft.com/en-gb/support/plans/

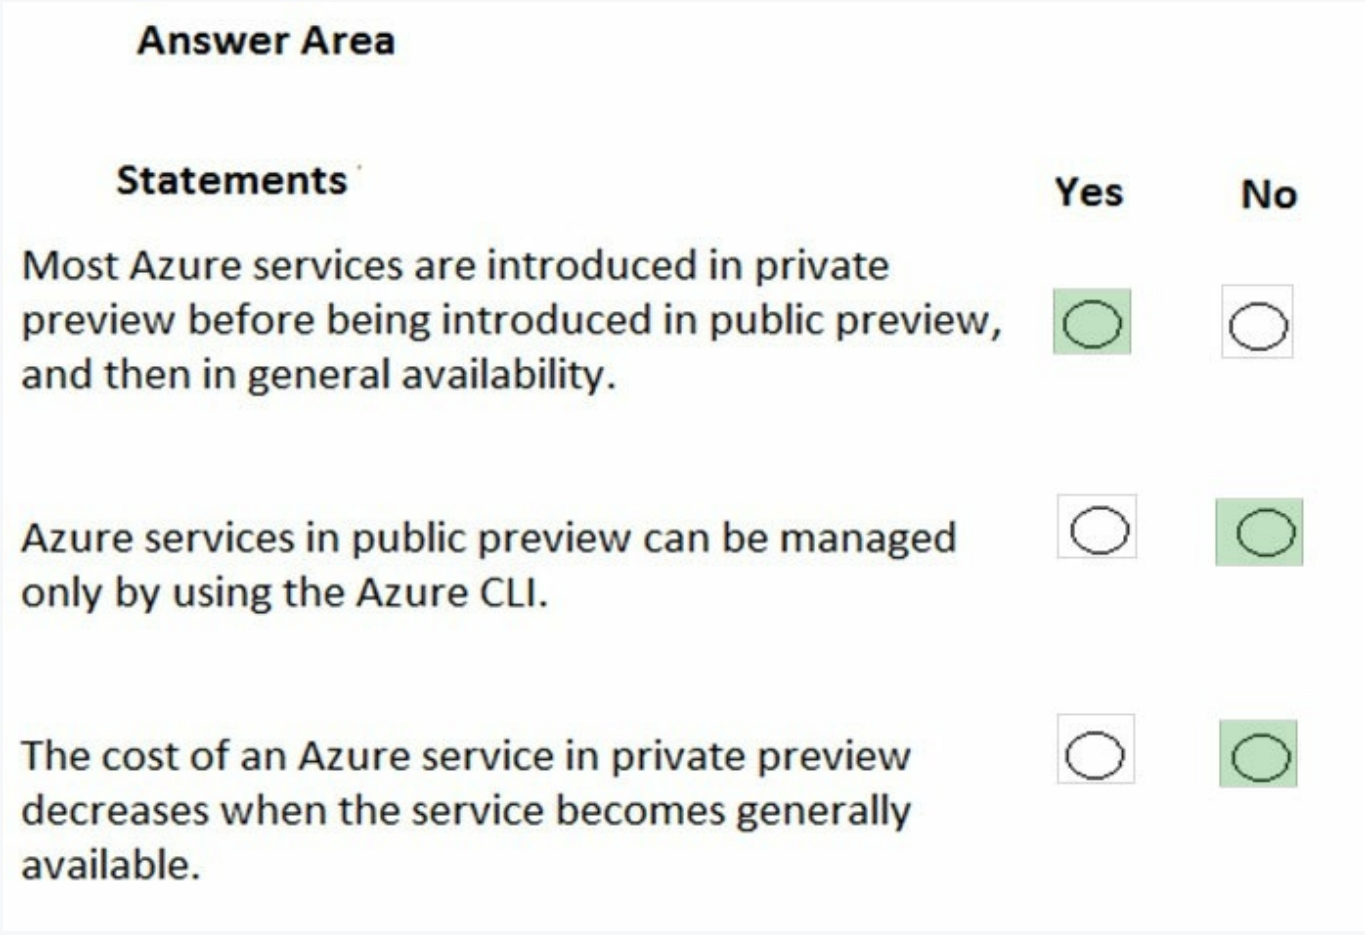
Question: 315 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.
Hot Area:



Answer:



Explanation:

Box 1: Yes -
Most services go to private preview then public preview before being released to general availability.
The private preview is only available to certain Azure customers for evaluation purposes. The public preview is available to all Azure customers.

Box 2: No -
Azure services in public preview can be managed using the regular management tools: Azure Portal, Azure CLI and PowerShell.

Box 3: No -
Services in private or public preview are usually offered at reduced costs. However, the costs increase, not decrease when the services are released to general availability.

Question: 316 CertyIQ

What is required to use Azure Cost Management?

A. a Dev/Test subscription
B. Software Assurance
C. an Enterprise Agreement (EA)
D. a pay-as-you-go subscription

Historical Context (Exam Answer Key): When Microsoft acquired Cloudyn and built native Azure Cost Management into the Azure portal, it was initially launched with requirement constraints: it was available only to customers with an Enterprise Agreement (EA). As a result, older exam item pools keyed this specific question strictly to C. an Enterprise Agreement (EA).

Modern Cloud Governance Reality: Today, Microsoft Cost Management (now unified under Cost Management + Billing) is on by default and supported across multiple billing types, including Enterprise Agreements (EA), Microsoft Customer Agreements (MCA), and individual Pay-As-You-Go subscriptions.

Answer: D

Explanation:

D (pay-as-you-go). It also supports EA. The difference is in the kind of data managed in the Cost Management tool.

"Cost Management includes all usage and purchases, including reservations and third-party offerings for Enterprise Agreement (EA) accounts. Microsoft Customer Agreement accounts and individual subscriptions with pay-as-you-go rates only include usage from Azure and Marketplace services. Support and other costs aren't included."

https://learn.microsoft.com/en-gb/azure/cost-management-billing/costs/understand-cost-mgt-data

Question: 317 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Running compute services (such as Azure Virtual Machines) are immediately powered off and deallocated. You cannot start or spin up virtual machines under a disabled subscription.

The Microsoft Entra tenant (Azure AD) and the Azure portal remain accessible for administrative, identity, and billing management.

Microsoft retains your data for a grace period (typically up to 90 days), allowing you to access and download stored data or upgrade to a Pay-As-You-Go subscription without immediate permanent data destruction.

Create additional Azure Active Directory (Azure AD) user accounts: Incorrect. Entra ID / Azure AD directory management is tenant-scoped and operates independently of resource-consumption subscription billing, so user and group management remains functional.

access your data stored in Azure: Incorrect. Microsoft maintains a retention/grace period for disabled subscriptions, allowing read access and export of data before permanent deletion occurs

Answer Area

Your Azure trial account expired last week.

You are now unable to

- Create additional Azure Active Directory (Azure AD) user accounts
- start an existing Azure virtual machine
- access your data stored in Azure
- access the Azure portal

Answer:

Answer Area

Your Azure trial account expired last week.

You are now unable to

- Create additional Azure Active Directory (Azure AD) user accounts
- start an existing Azure virtual machine
- access your data stored in Azure
- access the Azure portal

Explanation:

A stopped (deallocated) VM is offline and not mounted on an Azure host server. Starting a VM mounts the VM on a host server before the VM starts. As soon as the VM is mounted, it becomes chargeable. For this reason, you are unable to start a VM after a trial has expired.

Incorrect Answers:

- You are not charged for Azure Active Directory user accounts so you can continue to create accounts.
- You can access data that is already stored in Azure.
- You can access the Azure Portal. You can also reactivate and upgrade the expired subscription in the portal.

Question: 318 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company plans to purchase an Azure subscription.

The company's support policy states that the Azure environment must provide an option to access support engineers by phone or email.

You need to recommend which support plan meets the support policy requirement.

Solution: Recommend a Professional Direct support plan.

Does this meet the goal?

A. Yes

B. No

Answer: A

Explanation:

The Basic support plan does not have any technical support for engineers.

The Developer support plan has only technical support for engineers via email.

The Standard, Professional Direct, and Premier support plans have technical support for engineers via email and phone.

Reference:

https://azure.microsoft.com/en-gb/support/plans/

Question: 319 CertyIQ

Your company has a Software Assurance agreement that includes Microsoft SQL Server licenses.
You plan to deploy SQL Server on Azure virtual machines.
What should you do to minimize licensing costs for the deployment?

A. Deallocate the virtual machines during off hours.
B. Use Azure Hybrid Benefit.
C. Configure Azure Cost Management budgets.
D. Use Azure reservations.

Azure Hybrid Benefit (AHB): A cost-saving program that enables organizations to apply existing on-premises core licenses with active Software Assurance (or qualifying cloud subscriptions) toward Azure infrastructure.

When applied to Azure Virtual Machines running SQL Server or Windows Server, AHB waives the bundled software licensing surcharge, allowing the customer to pay solely for the underlying base compute hardware rate.

Answer: B

Applying these entitlements directly fulfills the goal of minimizing software licensing expenses for cloud-hosted database VMs.

Explanation:
Azure Hybrid Benefit is a licensing benefit that helps you to significantly reduce the costs of running your workloads in the cloud. It works by letting you use your on-premises Software Assurance-enabled Windows Server and SQL Server licenses on Azure.

Reference:
https://azure.microsoft.com/en-us/pricing/hybrid-benefit/

Question: 320 CertyIQ

Your company has 10 departments.
The company plans to implement an Azure environment.
You need to ensure that each department can use a different payment option for the Azure services it consumes.
What should you create for each department?

A. a reservation
B. a subscription
C. a resource group
D. a container instance

Answer: B

Explanation:
There are different payment options in Azure including pay-as-you-go (PAYG), Enterprise Agreement (EA), and Microsoft Customer Agreement (MCA) accounts.
Your Azure costs are 'per subscription'. You are charged monthly for all resources in a subscription. Therefore, to use different payment options per department, you will need to create a separate subscription per

department. You can create multiple subscriptions in a single Azure Active Directory tenant.
Incorrect Answers:
A: A reservation is where you commit to a resource (for example a virtual machine) for one or three years. This gives you a discounted price on the resource for the reservation period. Reservations do not provide a way to use different payment options per department.
C: A resource group is a logical container for Azure resources. You can view the total cost of all the resources in a resource group. However, resource groups do not provide a way to use different payment options per department.
D: A container instance is an Azure resource used to run an application. Container instances do not provide a way to use different payment options per department.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/manage/create-subscription

Question: 321 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statements	Yes	No
An Azure free account has a spending limit.	○	○
An Azure free account has a limit of 2TB of data that can be uploaded to Azure.	○	○
An Azure free account can contain an unlimited number of web apps.	○	○

Statement 2 (No): Microsoft does not enforce an arbitrary "2TB data upload" cap on free accounts. Inbound data transfers (ingress) into Azure data centers are free, and storage limits are governed by the specific free allowance (5 GB of LRS Blob/File storage free for 12 months) and subscription credit capacity, rather than a flat 2TB upload threshold.

Answer:

Statement 3 (No): Under the Azure App Service Free tier (F1), you can host up to 10 web, mobile, or API apps, not an unlimited number.

Statements	Yes	No
An Azure free account has a spending limit.	○	○
An Azure free account has a limit of 2TB of data that can be uploaded to Azure.	○	○
An Azure free account can contain an unlimited number of web apps.	○	○

Explanation:
Box 1: Yes -
An Azure free account has a spending limit. This is currently 200 USD or 150 GBP.

Box 2: No -
Azure free account has a 5 GB blob storage limit and a 5 GB file storage limit.

Box 3: No -
Azure free account has a limit of 10 web, mobile or API apps

Reference:
https://azure.microsoft.com/en-us/free/
https://azure.microsoft.com/en-us/free/free-account-faq/
https://docs.microsoft.com/en-us/azure/billing/billing-avoid-charges-free-account

Question: 322 CertyIQ

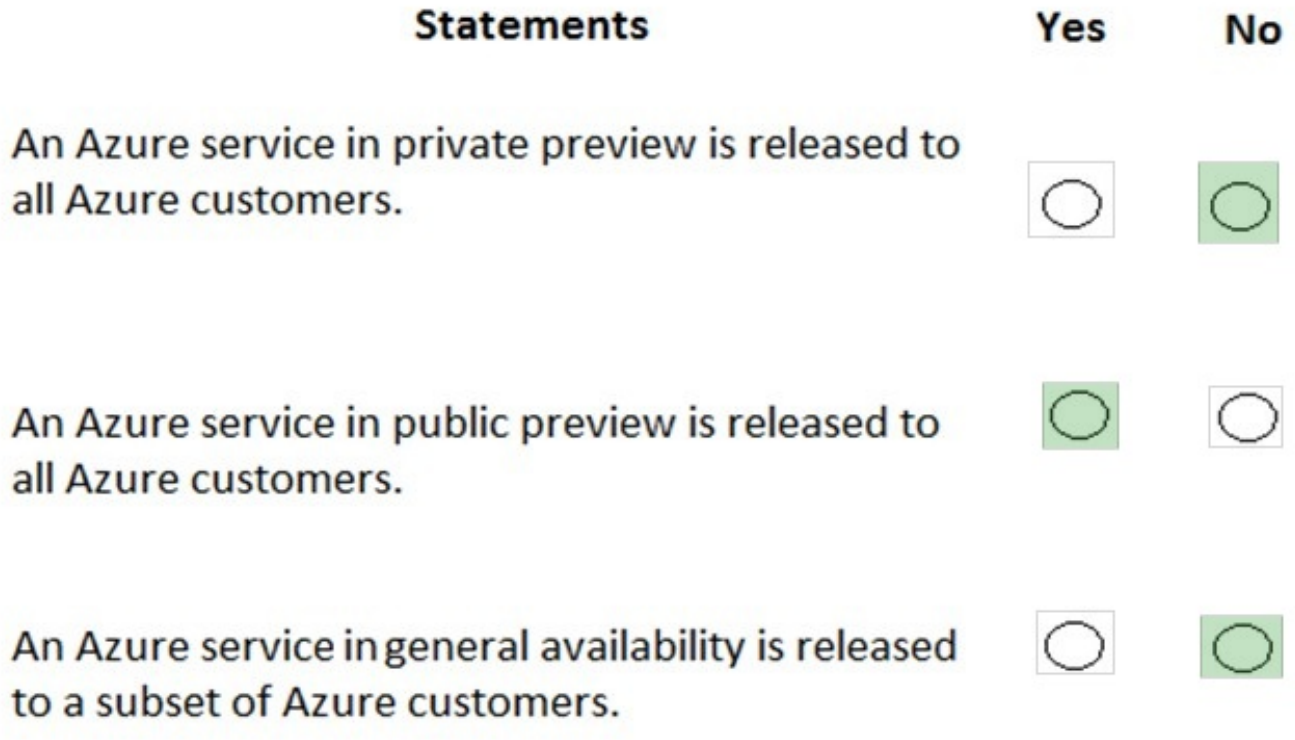
HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
An Azure service in private preview is released to all Azure customers.	○	○
An Azure service in public preview is released to all Azure customers.	○	○
An Azure service in general availability is released to a subset of Azure customers.	○	○

Answer:

Answer Area



Explanation:
Box 1: No -
Most services go to private preview then public preview before being released to general availability. The private preview is only available to certain Azure customers for evaluation purposes.

Box 2: Yes -
Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.
Public previews are excluded from SLAs and in some cases, no support is offered.

Box 3: No -
An Azure service in general availability is available to all Azure customers, not just a subset of the customers.

Reference:
https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms/

Question: 323 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
With a consumption-based plan, you pay a fixed rate for all data sent to or from virtual machines hosted in the cloud.	○	○
With a consumption-based plan, you reduce overall costs by paying only for extra capacity when it is required.	○	○
Serverless computing is an example of a consumption-based plan.	○	○

Statement 3 (Yes): Serverless computing (e.g., Azure Functions, Azure Logic Apps) is the quintessential implementation of the consumption model. You are billed solely for execution duration and resource consumption (e.g., memory per millisecond, number of executions) with zero idle costs when code is not actively running.

Answer:

Statement 2 (Yes): The fundamental economic advantage of the cloud consumption model is eliminating over-provisioning. Organizations stop paying for peak compute capacity 24/7; instead, auto-scaling provisions extra resources only when demand requires it and scales back down when demand drops, directly curbing wasted expenditure.

Answer Area

Statements	Yes	No
With a consumption-based plan, you pay a fixed rate for all data sent to or from virtual machines hosted in the cloud.	○	○
With a consumption-based plan, you reduce overall costs by paying only for extra capacity when it is required.	○	○
Serverless computing is an example of a consumption-based plan.	○	○

Explanation:

1. So for consumption based plan, no fixed rate - N

2. extra capacity only when its required. no fixed rate - Y

3. Y

Question: 324

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
The cost of Azure resources can vary between regions.	○	○
An Azure reservation is used to reserve server capacity at a specific data center.	○	○
You can stop an Azure SQL Database instance to decrease costs.	○	○

Answer:

Answer Area

Statements	Yes	No
The cost of Azure resources can vary between regions.	○	○
An Azure reservation is used to reserve server capacity at a specific data center.	○	○
You can stop an Azure SQL Database instance to decrease costs.	○	○

Explanation:

Y/Y/N

https://learn.microsoft.com/en-us/azure/cost-management-billing/reservations/manage-reserved-vm-instance

If you bought Azure Reserved Virtual Machine Instances, you can change the optimize setting for the reservation. The reservation discount can apply to VMs in the same series or you can reserve data center capacity for a specific VM size. You should try to optimize reservations so that they're fully used.

Question: 325 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Composite SLA Calculation: When an application relies on two independent services in serial (meaning if either service fails, the entire application fails), the overall availability is calculated by multiplying the individual service SLAs together:

Composite SLA = SLA Web App x SLA SQL DB}
= 0.9995 x 0.9999 -> 0.99940005 approx 99.94%

Answer Area

You have an application that is comprised of an Azure web app that has a Service Level Agreement (SLA) of 99.95 percent and an Azure SQL database that has an SLA of 99.99 percent.

The composite SLA for the application is

- the product of both SLAs, which equals 99.94 percent
- the lowest SLA associated to the application, which is 99.95 percent
- the highest SLA associated to the application, which is 99.99 percent
- the difference between the two SLAs, which is 0.05 percent

Answer:

Answer Area

You have an application that is comprised of an Azure web app that has a Service Level Agreement (SLA) of 99.95 percent and an Azure SQL database that has an SLA of 99.99 percent.

The composite SLA for the application is

- the product of both SLAs, which equals 99.94 percent
- the lowest SLA associated to the application, which is 99.95 percent
- the highest SLA associated to the application, which is 99.99 percent
- the difference between the two SLAs, which is 0.05 percent

Explanation:

Composite SLAs involve multiple services supporting an application, each with differing levels of availability. For example, consider an App Service web app that writes to Azure SQL Database. At the time of this writing, these Azure services have the following SLAs:

App Service web apps = 99.95%

SQL Database = 99.99%

What is the maximum downtime you would expect for this application? If either service fails, the whole application fails. The probability of each service failing is independent, so the composite SLA for this application is 99.95% — 99.99% = 99.94%. That's lower than the individual SLAs, which isn't surprising because an application that relies on multiple services has more potential failure points.

Reference:
https://docs.microsoft.com/en-us/azure/architecture/reliability/requirements#understand-service-level-agreements

Question: 326

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): Not all paid Azure services carry a guaranteed uptime of at least 99.9%. For instance, a single Azure Virtual Machine using Standard HDD Managed Disks carries an official SLA of only 95% (or 99.5% for Standard SSD), which falls well below the 99.9% threshold.

Statement 2 (Yes): Architecting applications for redundancy across multiple regions or Availability Zones allows organizations to calculate a higher combined availability/composite SLA for independent fallback paths. For example, deploying virtual machines across Availability Zones elevates the VM uptime SLA to 99.99%, and using multi-region redundancy with load balancing (e.g., Azure Front Door or Traffic Manager) mathematically improves overall architecture uptime over a single-region deployment.

Statement 3 (No): Subscriptions are purely logical billing and management boundaries within a tenant; they provide zero infrastructure redundancy. Splitting workloads across multiple subscriptions does not alter the underlying data center deployment, hardware fault domains, or service uptime guarantees.

Answer Area

Statements	Yes	No
The Service Level Agreement (SLA) guaranteed uptime for paid Azure services is at least 99.9 percent.	○	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by adding Azure resources to multiple regions.	○	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by purchasing multiple subscriptions.	○	○

Answer:

Answer Area

Statements	Yes	No
The Service Level Agreement (SLA) guaranteed uptime for paid Azure services is at least 99.9 percent.	○	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by adding Azure resources to multiple regions.	○	○
Companies can increase the Service Level Agreement (SLA) guaranteed uptime by purchasing multiple subscriptions.	○	○

Explanation:

Box 1: Yes -
SLA's vary based on the resource type and the location distribution of the resource. However, the minimum uptime for all Azure services is 99.9 percent.

Box 2: Yes -
The SLA guaranteed uptime is increased (usually to 99.95 percent) when resources are deployed across multiple regions.

Box 3: No -
The number of subscriptions is unrelated to uptime SLA's. You can deploy resources to multiple regions under a single subscription or you can have multiple subscriptions with resources deployed to the same region.

Reference:
https://azure.microsoft.com/en-us/support/legal/sla/summary/

Question: 327 CertyIQ

Which statement accurately describes the Modern Lifecycle Policy for Azure services?

A. Microsoft provides mainstream support for a service for five years.

B. Microsoft provides a minimum of 12 months' notice before ending support for a service.

C. After a service is made generally available, Microsoft provides support for the service for a minimum of four years.

D. When a service is retired, you can purchase extended support for the service for up to five years.

Microsoft Modern Lifecycle Policy: Most Azure cloud services, features, and online services are governed by the Modern Lifecycle Policy (contrasted with the Fixed Lifecycle Policy used for on-premises software like Windows Server or SQL Server).

Answer: B

Under this policy, services are serviced and supported continuously as long as customers stay current according to the licensing and servicing requirements for the product.

Explanation:

For products governed by the Modern Lifecycle Policy, Microsoft will provide a minimum of 12 months' notification prior to ending support if no successor product or service is offered " excluding free services or preview releases.

If Microsoft decides to end support for (retire) an Azure service or feature without offering a successor product or service, Microsoft commits to providing at least 12 months' advance notice to give customers adequate time to migrate or adapt their workloads.

Reference:
https://support.microsoft.com/en-us/help/30881/modern-lifecycle-policy

Question: 328 CertyIQ

HOTSPOT -
You need to request that Microsoft increase a subscription quota limit for your company.
Which blade should you use from the Azure portal? To answer, select the appropriate blade in the answer area.
Hot Area:

Target Blade: Help + support (or navigate via Help + support $\rightarrow$ New support request $\rightarrow$ Issue type: Service and subscription limits (quotas)).

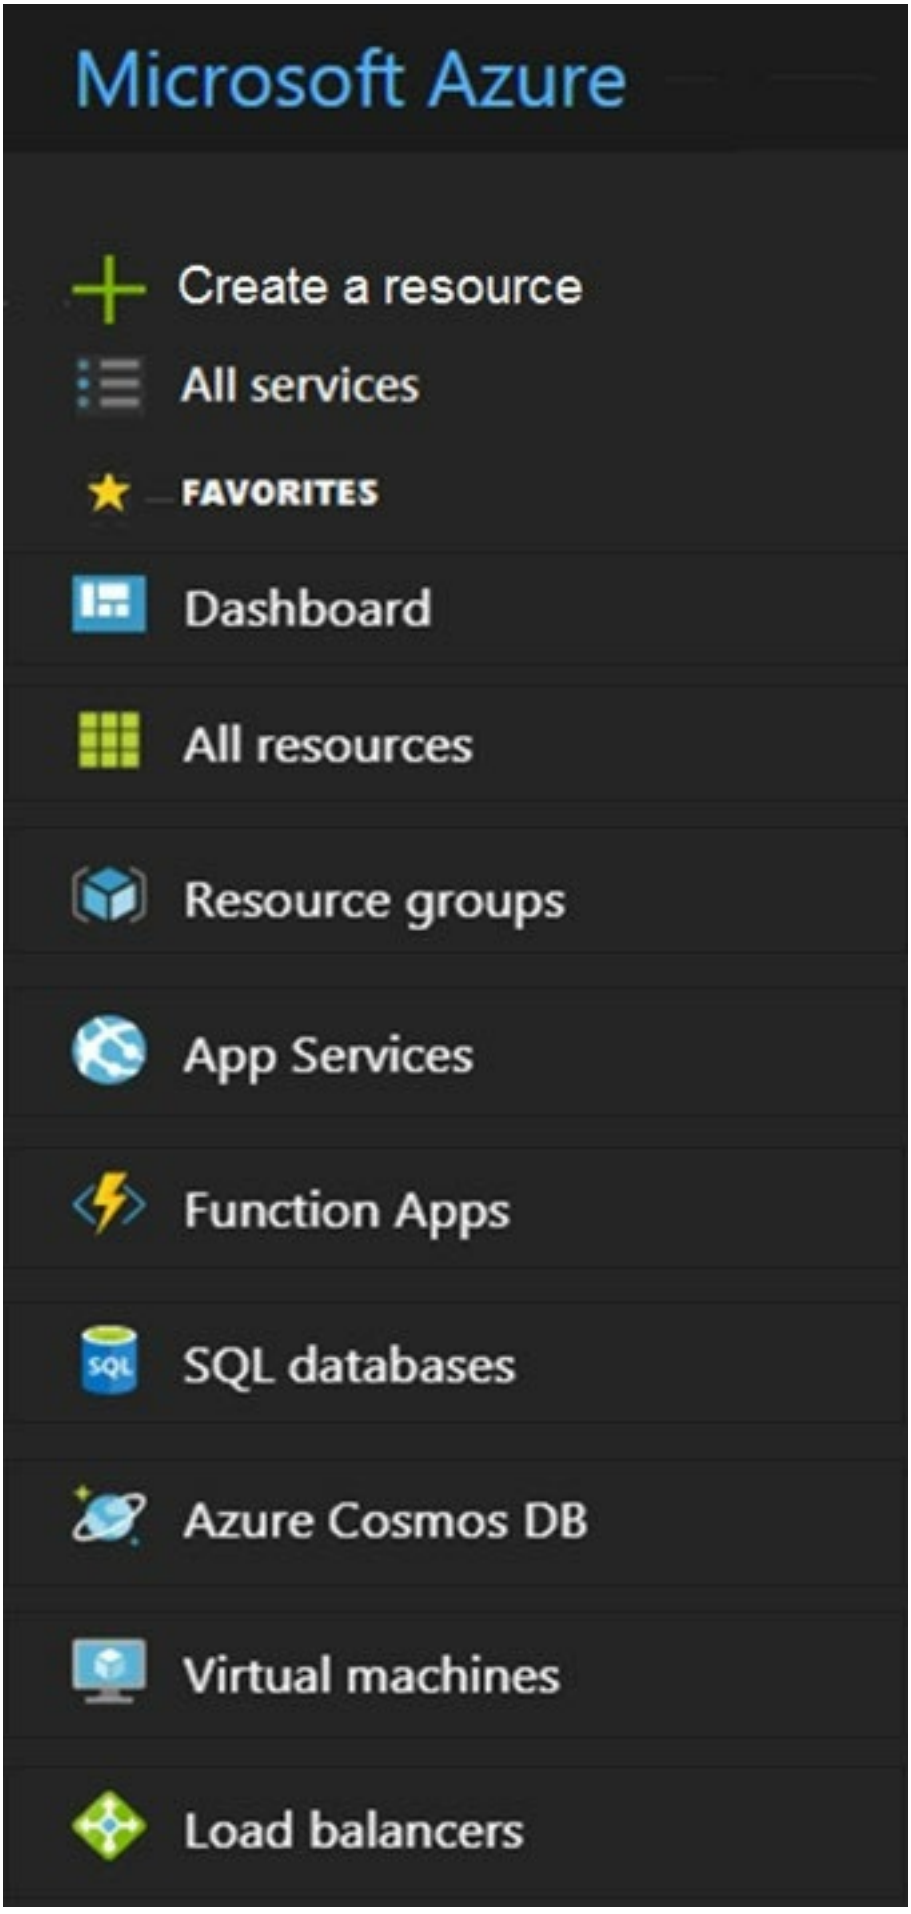
Alternative Portal Path: Subscriptions (under Usage + quotas / Quotas blade).

Image Truncation Note: The uploaded screenshot visibly crops off the bottom half of the Azure portal left navigation pane. On the complete exam hotspot graphic, the clickable target item is Help + support located further down the navigation bar.

Azure subscriptions have default operational quotas (e.g., maximum regional vCPU cores, networking limits, resource group counts) designed to prevent accidental over-allocation and safeguard service capacity.

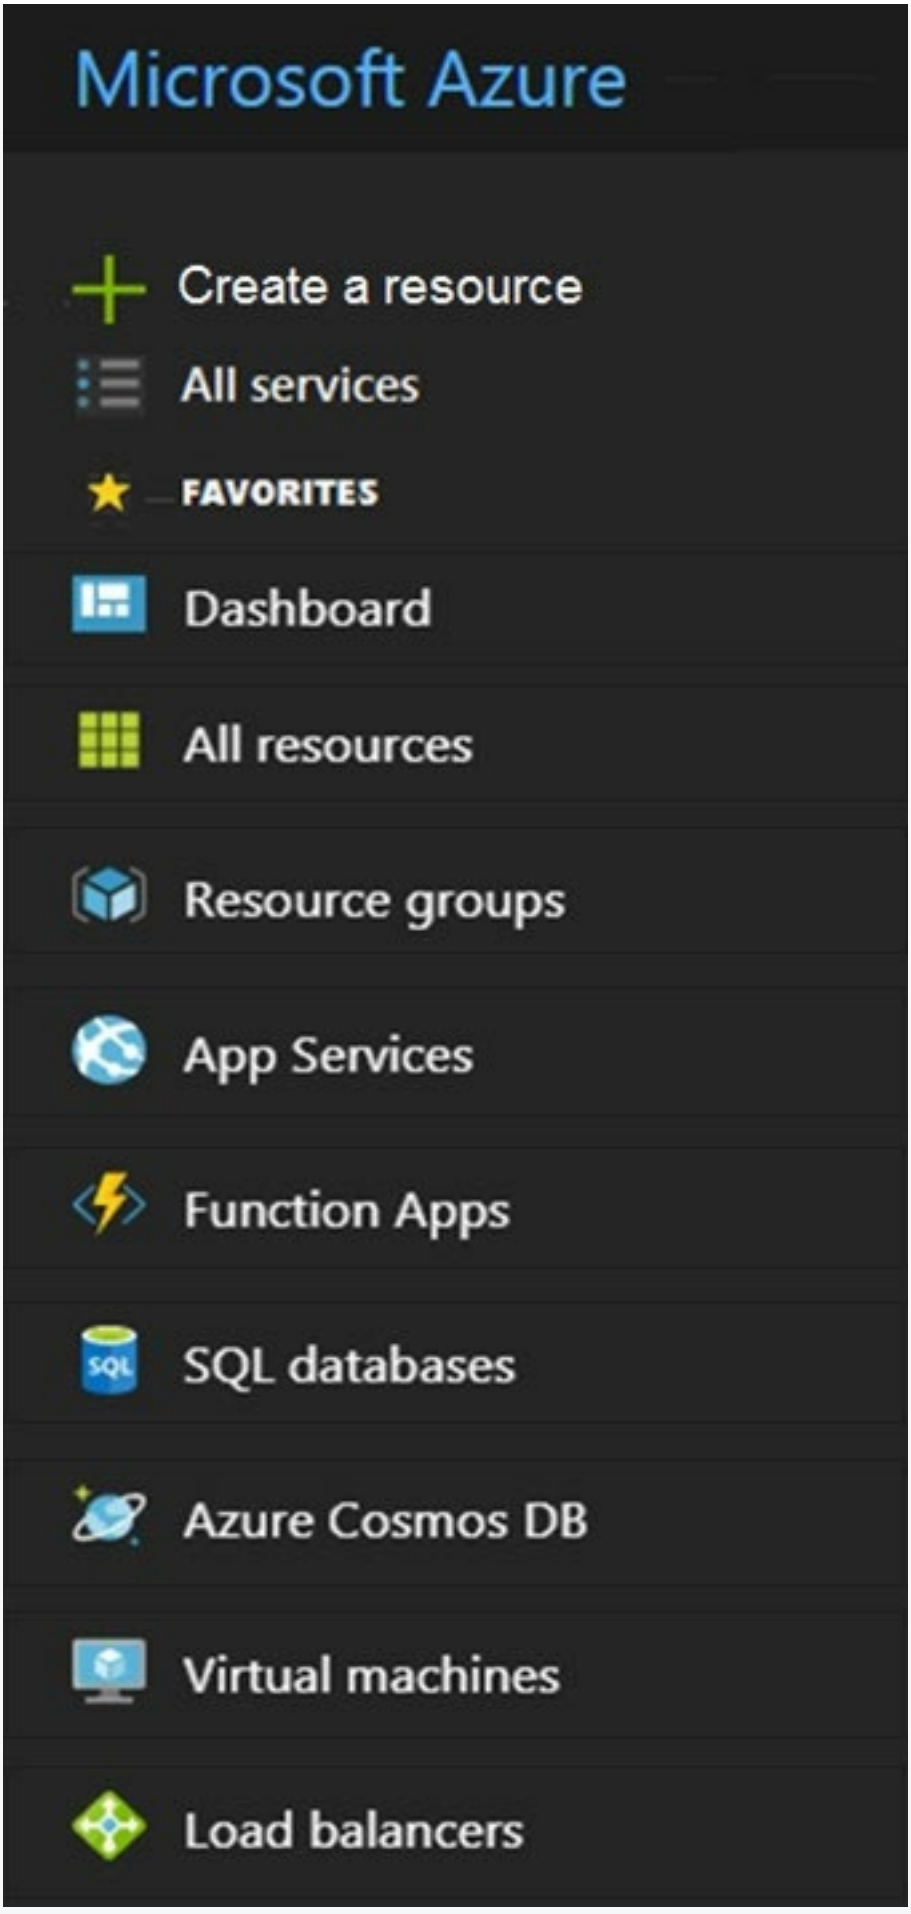
Subscription quota increase requests are considered administrative/billing tickets and are submitted free of charge across all support tiers (including Basic) by opening a support request in the Help + support blade.

When creating a ticket under Help + support, selecting Issue type: Service and subscription limits (quotas) directs the request to Microsoft's capacity engineering team for automated or manual limit elevation.



Target Blade: Help + support (or navigate via Help + support $\rightarrow$ New support request $\rightarrow$ Issue type: Service and subscription limits (quotas)).Alternative Portal Path: Subscriptions (under Usage + quotas / Quotas blade).Image Truncation Note: The uploaded screenshot visibly crops off the bottom half of the Azure portal left navigation pane. On the complete exam hotspot graphic, the clickable target item is Help + support located further down the navigation bar.

Answer:



Explanation:

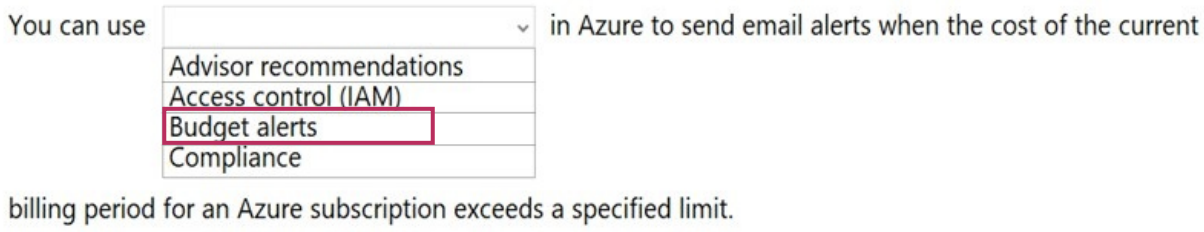
Request a standard quota increase from Help + support

Reference:

https://docs.microsoft.com/en-us/azure/azure-portal/supportability/per-vm-quota-requests

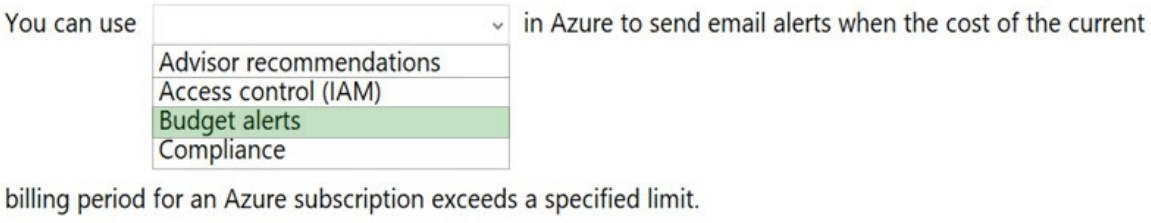
Question: 329 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:
Answer Area



Answer:

Answer Area



Explanation:
Budget alerts notify you when spending, based on usage or cost, reaches or exceeds the amount defined in the alert condition of the budget. Cost Management budgets are created using the Azure portal or the Azure Consumption API.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/costs/cost-mgt-alerts-monitor-usage-spending

Question: 330 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (Yes): The Azure portal explicitly identifies preview features and services using a visual badge or tag labeled "(preview)" next to the service name or feature blade (e.g., in the Marketplace, search bar, and resource configuration menus), making it easy to distinguish them from Generally Available (GA) services.

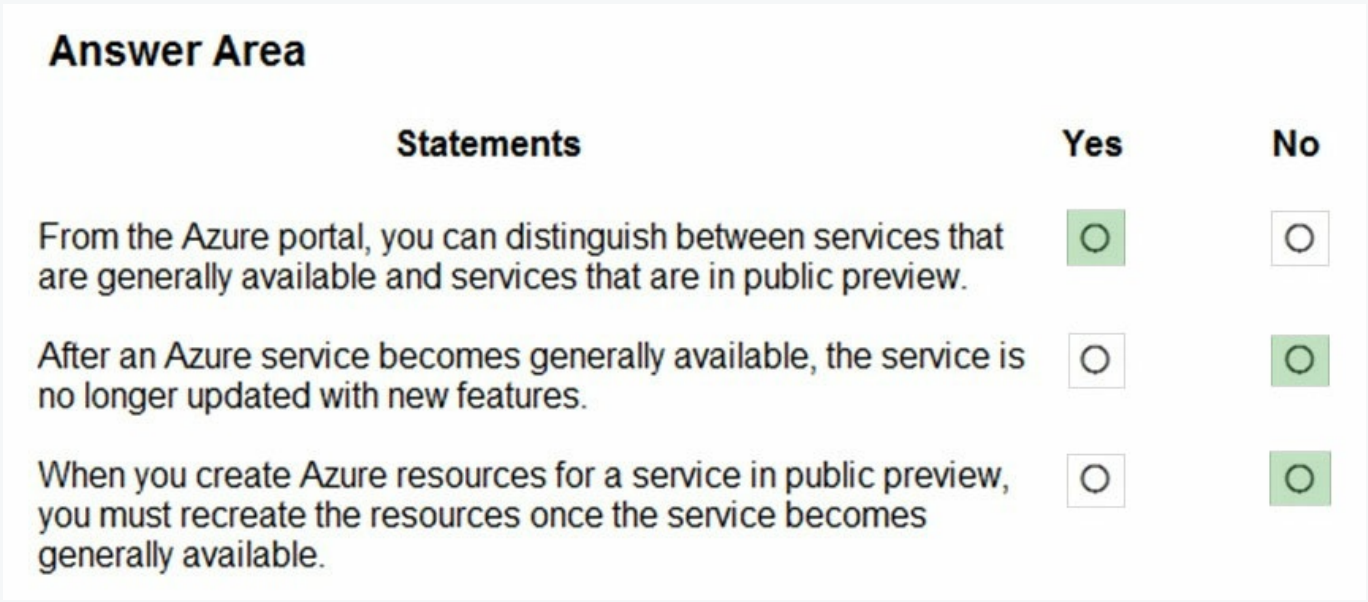
Statement 2 (No): Under the cloud service model and Microsoft's Modern Lifecycle Policy, services in General Availability continue to receive ongoing feature updates, security patches, performance improvements, and capabilities throughout their active lifecycle.

Statement 3 (No): Resources deployed during public preview do not need to be torn down and recreated when a service transitions to GA. The underlying infrastructure seamlessly transitions into General Availability, at which point standard pricing and formal Service Level Agreements (SLAs) simply take effect.

Answer Area

Statements	Yes	No
From the Azure portal, you can distinguish between services that are generally available and services that are in public preview.	○	○
After an Azure service becomes generally available, the service is no longer updated with new features.	○	○
When you create Azure resources for a service in public preview, you must recreate the resources once the service becomes generally available.	○	○

Answer:



Explanation:

Reference:
https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms/

Question: 331 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (Yes): Inbound data transfer (ingress) into Azure data centers is universally free across both standard internet/VPN connections and Azure ExpressRoute circuits. Under both the Metered Data and Unlimited Data billing plans for ExpressRoute, all inbound data transfer carries a rate of $0.00 per GB.

Statement 2 (No): Outbound data transfer (egress) from Azure back to an on-premises network is generally billable. Under the standard ExpressRoute Metered Data plan, customers are charged an egress fee per gigabyte based on the region zone. It is only included in the base fee if an organization explicitly purchases the significantly more expensive Unlimited Data plan, meaning egress is not "always free".

Statement 3 (Yes): For foundational cloud economics in the AZ-900 syllabus, Microsoft defines intra-region communication as standard free traffic: data moving between Azure services located within the same Azure datacenter/region incurs no data transfer charges.

Answer Area

Statements	Yes	No
When using an Azure ExpressRoute connection, inbound data traffic from an on-premises network to Azure is always free.	○	○
Outbound data traffic from Azure to an on-premises network is always free.	○	○
Data traffic between Azure services within the same Azure region is always free.	○	○

Answer:

Answer Area

Statements	Yes	No
When using an Azure ExpressRoute connection, inbound data traffic from an on-premises network to Azure is always free.	○	○
Outbound data traffic from Azure to an on-premises network is always free.	○	○
Data traffic between Azure services within the same Azure region is always free.	○	○

Explanation:

Box 1: Yes -

With Azure ExpressRoute, all inbound data transfer is free of charge.

Box 2: No -

Inbound data traffic is free but outbound data traffic is not.

Box 3: Yes -

>>>>>>>>>>>>>>>>>>>>>>

1. Yes. You already use and pay ExpressRoute. They just ask if inbound data is free of charge, which it is.

2. No. Outbound data is not free of charge.

3. Yes. Within same region is free.

>>>>>>>>>>>>>>>>>.>>>>>

us/pricing/details/bandwidth/

Question: 332 CertyIQ

Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Which unused resources should you remove?

A. the network interfaces
B. the public IP addresses
C. the groups
D. the user accounts

Azure Networking Billing: Public IPv4 addresses allocated to a subscription incur a small hourly fee regardless of whether they are actively associated with a running resource (such as a Virtual Machine, Application Gateway, or Load Balancer) or sitting unattached. Deleting unused public IP addresses immediately eliminates those recurring charges.

Virtual Network Interfaces (NICs) are free resources within an Azure Virtual Network; having standalone or unattached NICs carries zero direct cost.

Answer: B

Microsoft Entra ID (Azure AD) free directory objects (user accounts and security groups) do not incur per-object consumption charges on the Azure subscription billing invoice.

Explanation:
You are charged for public IP addresses. Therefore, deleting unused public IP addresses will reduce the Azure costs.

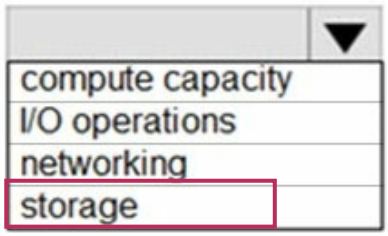
Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 333 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for



Answer:

Azure VM States & Billing:

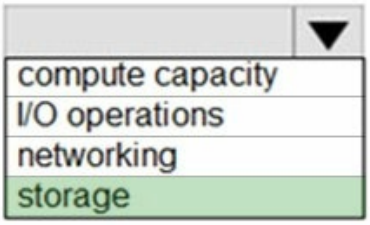
Stopped (Allocated): If a VM is shut down from within the guest operating system, Azure keeps the hardware resources (CPU, RAM) reserved. Compute charges continue to accumulate.

Stopped (deallocated): When stopped via the Azure portal, Azure CLI (az vm deallocate), PowerShell, or Azure Resource Manager, compute hardware resources are completely released back to the datacenter pool. Compute hourly billing stops immediately.

However, any persistent disks (OS disk, data disks) associated with the VM remain intact in Azure Storage to preserve operating system state and files. Therefore, you continue to pay for the provisioned disk storage.

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for



Explanation:
When a virtual machine is stopped (deallocated), the virtual machine is unloaded/dismounted from the physical server in Azure. In this state, you are not charged for the virtual machine itself. However, you are still charged for the storage costs of the virtual hard disks attached to the virtual machine.
If the virtual machine is stopped but not deallocated (this happens if you shut down the virtual machine from the operating system of the virtual machine), the virtual machine is still mounted on the physical server in Azure and you are charged for the virtual machine itself as well as the storage costs. To ensure that a virtual machine is 'stopped (deallocated)', you need to stop the virtual machine in the Azure portal.

Reference:
https://blogs.technet.microsoft.com/uspartner_ts2team/2014/10/10/azure-virtual-machines-stopping-versus-stopping-deallocating/

Question: 334 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): Azure storage pricing is region-dependent. Storage capacity rates vary across geographic regions due to differences in local infrastructure costs,

Statements	Yes	No
Storing 1 TB of data in Azure Blob storage will always cost the same, regardless of the Azure region in which the data is located.	○	○
When you use a general-purpose v2 Azure Storage account, you are only charged for the amount of data that is stored. All read and write operations are free.	○	○
Transferring data between Azure Storage accounts in different Azure regions is free.	○	○

Statement 2 (No): General-purpose v2 (GPv2) storage accounts follow a multi-dimensional pricing model: billing includes capacity (data stored per GB), transaction operations (read, write, delete, and list operations per 10,000 requests), data retrieval charges (especially for Cool and Archive tiers), and data egress. Read and write operations are never entirely free.

Answer:

Statement 3 (No): Cross-region network traffic is metered. Moving data from a storage account in one Azure region to a storage account in a different Azure region involves outbound data transfer (egress) from the source region, which incurs standard inter-region data transfer fees.

Statements	Yes	No
Storing 1 TB of data in Azure Blob storage will always cost the same, regardless of the Azure region in which the data is located.	○	○
When you use a general-purpose v2 Azure Storage account, you are only charged for the amount of data that is stored. All read and write operations are free.	○	○
Transferring data between Azure Storage accounts in different Azure regions is free.	○	○

Explanation:

Inbound is free.

Outbound is paid per GB.

Storage rent is paid per GB/month.

Storage read/write operations are paid.

Box 1: No -

The price of Azure storage varies by region. If you use the Azure storage pricing page, you can select different regions and see how the price changes per region.

Box 2: No -

You are charged for read and write operations in general-purpose v2 storage accounts.

Box 3: No -

You would be charge for the read operations of the source storage account and write operations in the destination storage account.

Reference:

https://docs.microsoft.com/en-us/azure/storage/common/storage-account-overview
https://azure.microsoft.com/en-gb/pricing/details/storage/blobs/

Question: 335

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 1 (Yes): Microsoft guarantees at least 99.9% availability for paid Microsoft Entra ID (formerly Azure Active Directory) tiers, including Basic, Premium P1, and Premium P2.

Statements	Yes	No
In Azure Active Directory Premium P2, at least 99.9 percent availability is guaranteed.	○	○
The Service Level Agreement (SLA) for Azure Active Directory Premium P2 is the same as the SLA for Azure Active Directory Free.	○	○
All paying Azure customers receive a credit if their monthly uptime percentage is below the guaranteed amount in the Service Level Agreement (SLA).	○	○

Statement 2 (No): Free tiers do not carry an SLA. Microsoft Entra ID Free does not provide a financially backed Service Level Agreement, whereas Premium P1 and Premium P2 carry a financially backed 99.9% SLA commitment. Therefore, the SLAs are not the same.

Answer:

Service Credits are not issued automatically. To receive a Service Credit under an Azure SLA, customers must proactively submit a claim/incident ticket to Microsoft Customer Support with supporting evidence within the required timeframe (typically by the end of the calendar month following the month of the incident).

Answer Area

Statements	Yes	No
In Azure Active Directory Premium P2, at least 99.9 percent availability is guaranteed.	○	○
The Service Level Agreement (SLA) for Azure Active Directory Premium P2 is the same as the SLA for Azure Active Directory Free.	○	○
All paying Azure customers receive a credit if their monthly uptime percentage is below the guaranteed amount in the Service Level Agreement (SLA).	○	○

Explanation:

Box 1: Yes -

Microsoft guarantee at least 99.9% availability of the Azure Active Directory Premium edition services. The services are considered available in the following scenarios:
➪ Users are able to login to the service, login to the Access Panel, access applications on the Access Panel and reset passwords.
➪ IT administrators are able to create, read, write and delete entries in the directory or provision or de-provision users to applications in the directory.

Box 2: No -
No SLA is provided for the Free tier of Azure Active Directory.

Box 3: Yes -
You can claim credit if the availability falls below the SLA. The amount of credit depends on the availability. For example: You can claim 25% credit if the availability is less than 99.9%, 50% credit for less than 99% and 100% for less than 95% availability.

Reference:
https://azure.microsoft.com/en-gb/support/legal/sla/active-directory/v1_0/

Question: 336 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 1 (No): Resource Groups are logical organizational containers within an Azure subscription used to group related assets for lifecycle and access management. Creating and maintaining resource groups is entirely free; billing is determined solely by the actual resources provisioned inside them.

Statement 2 (No): Inbound data transfer (ingress) into Azure datacenters from an on-premises network (regardless of whether using the public internet, a VPN gateway, or ExpressRoute) is free of data transfer charges ($0.00/GB).

Statements	Yes	No
Adding resource groups in an Azure subscription generates additional costs.	○	○
Copying 10 GB of data **to** Azure **from** an on-premises network over a VPN generates additional Azure data transfer costs.	○	○
Copying 10 GB of data **from** Azure **to** an on-premises network over a VPN generates additional Azure data transfer costs.	○	○

Statement 3 (Yes): Outbound data transfer (egress) leaving Azure datacenters to an external destination (such as an on-premises environment over a VPN Gateway) is metered and billed per gigabyte beyond the initial monthly free allowance.

Answer:

Answer Area

Statements	Yes	No
Adding resource groups in an Azure subscription generates additional costs.	○	○
Copying 10 GB of data **to** Azure **from** an on-premises network over a VPN generates additional Azure data transfer costs.	○	○
Copying 10 GB of data **from** Azure **to** an on-premises network over a VPN generates additional Azure data transfer costs.	○	○

Explanation:
Box 1: No -
Resource groups are logical containers for Azure resources. You do not pay for resource groups.

Box 2: No -
Data ingress over a VPN is data 'coming in' to Azure over the VPN. You are not charged data transfer costs for data ingress.

Box 3: Yes -
Data egress over a VPN is data 'going out' of Azure over the VPN. You are charged for data egress.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/manage-resource-groups-portal
https://azure.microsoft.com/en-us/pricing/details/bandwidth/

Question: 337 CertyIQ

Who can use the Azure Total Cost of Ownership (TCO) calculator?

A. billing readers for an Azure subscription only
B. owners for an Azure subscription only
C. anyone
D. all users who have an account in Azure Active Directory (Azure AD) that is linked to an Azure subscription only

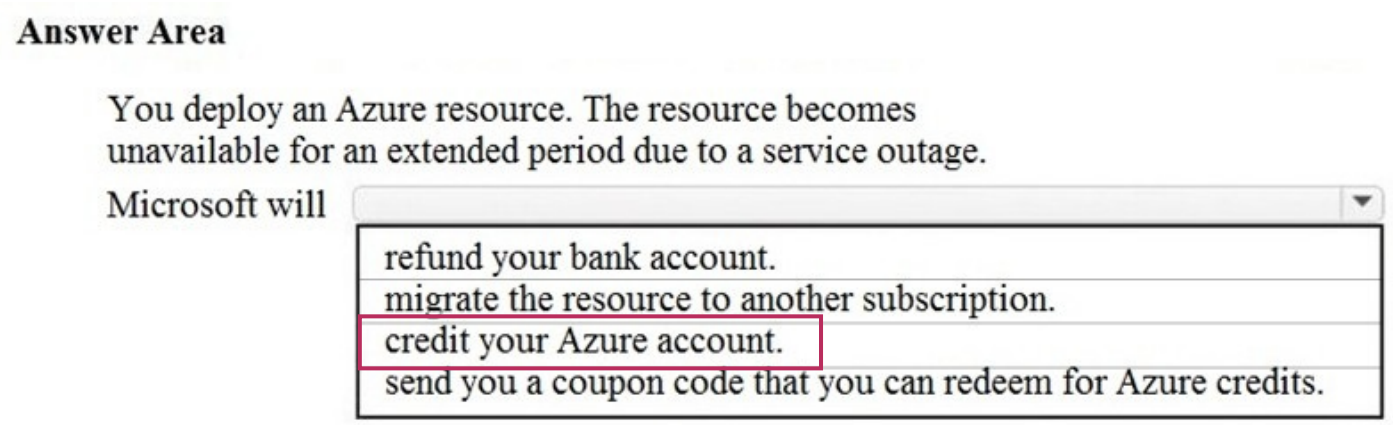
Answer: C

Explanation:
You don't need an Azure subscription to work with the TCO Calculator.

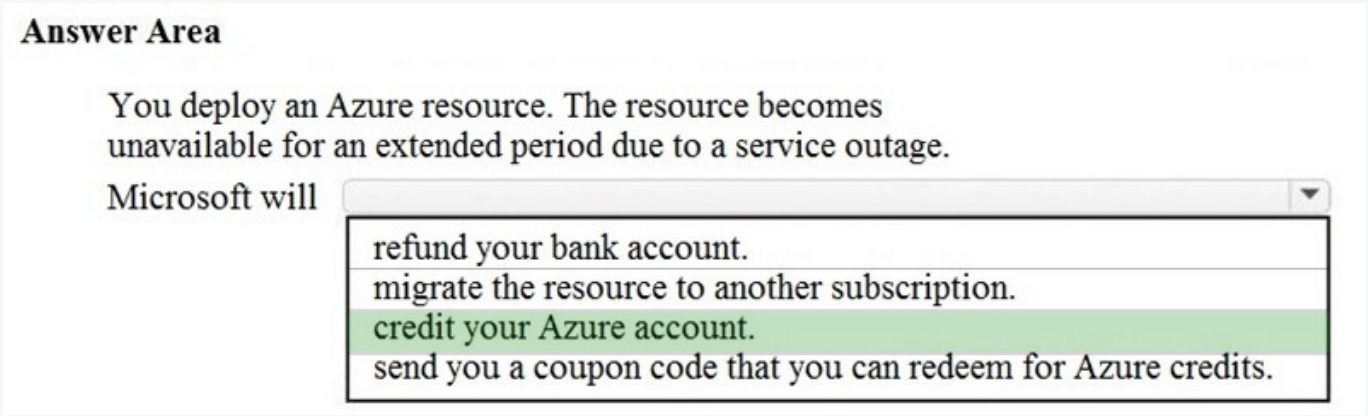
Reference:
https://docs.microsoft.com/en-us/learn/modules/plan-manage-azure-costs/2-compare-costs-tco-calculator

Question: 338 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



Explanation:
If the SLA for an Azure service is not met, you receive credits for that service and that service only. The credits are deducted from your monthly bill for that service.
If you stopped using the service where the SLA was not met, your account would remain in credit for that service. The credits would not be applied to any other services that you may be using.
Service Credits apply only to fees paid for the particular Service, Service Resource, or Service tier for which a Service Level has not been met. In cases where
Service Levels apply to individual Service Resources or to separate Service tiers, Service Credits apply only to fees paid for the affected Service Resource or
Service tier, as applicable. The Service Credits awarded in any billing month for a particular Service or Service Resource will not, under any circumstance, exceed your monthly service fees for that Service or Service Resource, as applicable, in the billing month.

Reference:
https://azure.microsoft.com/en-gb/support/legal/sla/analysis-services/v1_0/

Question: 339 CertyIQ

Which task can you perform by using Azure Advisor?

A. Integrate Active Directory and Azure Active Directory (Azure AD).

B. Estimate the costs of an Azure solution.

C. Confirm that Azure subscription security follows best practices.

D. Evaluate which on-premises resources can be migrated to Azure.

Azure Advisor is a personalized recommendation service that analyzes your deployed resources and suggests improvements in five areas: reliability, security, performance, cost optimization, and operational excellence. Its security recommendations (drawn from Microsoft Defender for Cloud) are what let you check that your subscription follows best practices.

Answer: C

Explanation: A. Integrate Active Directory and Azure AD: done with Azure AD Connect (Microsoft Entra Connect).
D. Evaluate which on-premises resources can be migrated: done with Azure Migrate.

Price estimation is provided by pricing calculator

Advisor provides relevant best practices to help you improve reliability, security, and performance, achieve operational excellence, and reduce costs. Configure Advisor to target specific subscriptions and resource groups, to focus on critical optimisations. Access Advisor through the Azure portal, the Azure Command Line Interface (CLI), or the Advisor API. Or configure alerts to notify you automatically about new recommendations.

https://blog.pragmaticworks.com/what-is-azure-advisor#:~:text=Microsoft%20defines%20Azure%20Advisor%20as,solutions%20based%20on%20that%20data

Question: 340 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
If your company uses an Azure free account, you will only be able to use a subset of Azure services.	○	○
All Azure free accounts expire after a specific period.	○	○
You can create up to 10 Azure free accounts by using the same Microsoft account.	○	○

Answer:

Answer Area

Statements	Yes	No
If your company uses an Azure free account, you will only be able to use a subset of Azure services.	○	○
All Azure free accounts expire after a specific period.	○	○
You can create up to 10 Azure free accounts by using the same Microsoft account.	○	○

Explanation:

Box 1: Yes

Box 2: Yes -

All free accounts expire after 12 months.

Box 3: No -

You can only create one free Azure account per Microsoft account.

Reference:

https://azure.microsoft.com/en-us/free/free-account-faq/

Question: 341 CertyIQ

You have an Azure application that uses the services shown in the following table.

Service	Service Level Agreement (SLA)
Azure virtual machines	99.9%
Azure SQL Database	99.99%

How should you calculate the composite SLA for the application?

A. 0.999 * 0.9999 = 0.9989001 = 99.89001%
B. 0.999 / 0.9999 = 0.9991 = 99.91%
C. Max(0.999, 0.9999) = 0.9999 = 99.99%
D. Min(0.999, 0.9999) = 0.999 = 99.9%

Answer:

A

Explanation:

Composite SLAs involve multiple services supporting an application, each with differing levels of availability. For example, consider an App Service web app that writes to Azure SQL Database. At the time of this writing, these Azure services have the following SLAs:

- App Service web apps = 99.95%
- SQL Database = 99.99%

What is the maximum downtime you would expect for this application? If either service fails, the whole application fails. The probability of each service failing is independent, so the composite SLA for this application is 99.95% * 99.99% = 99.94%. That's lower than the individual SLAs, which isn't surprising because an application that relies on multiple services has more potential failure points.

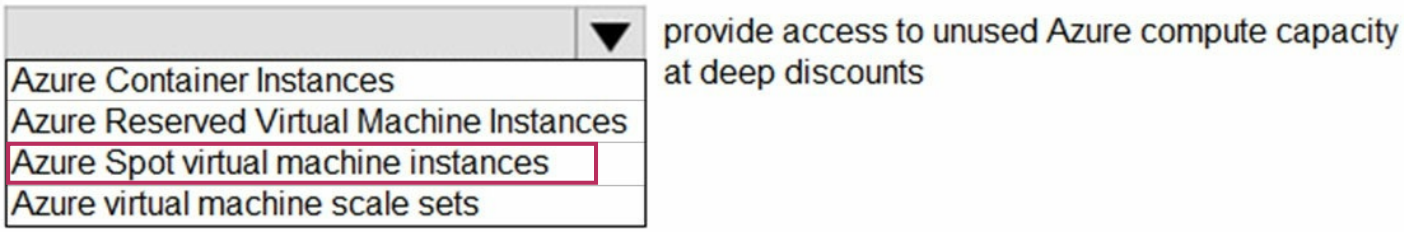
https://docs.microsoft.com/en-us/azure/architecture/reliability/requirements#understand-service-level-agreements

Question: 342 CertyIQ

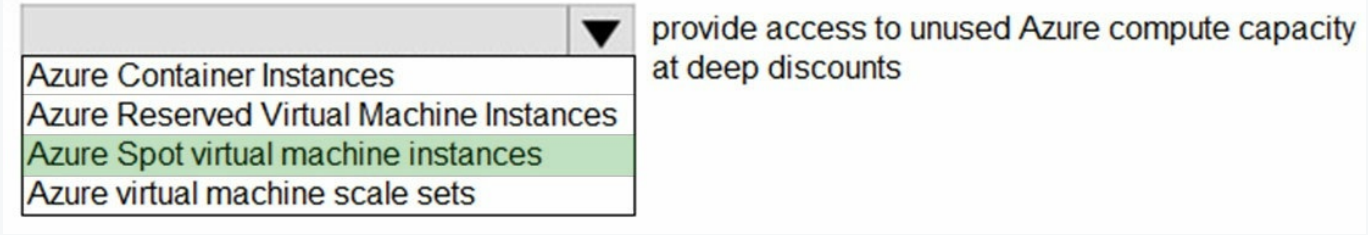
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

"Azure Spot VM instances" is the answer.

https://learn.microsoft.com/en-us/azure/virtual-machines/spot-vms

Using Azure Spot Virtual Machines allows you to take advantage of our unused capacity at a significant cost savings. At any point in time when Azure needs the capacity back, the Azure infrastructure will evict Azure Spot Virtual Machines. Therefore, Azure Spot Virtual Machines are great for workloads that can handle interruptions like batch processing jobs, dev/test environments, large compute workloads, and more.

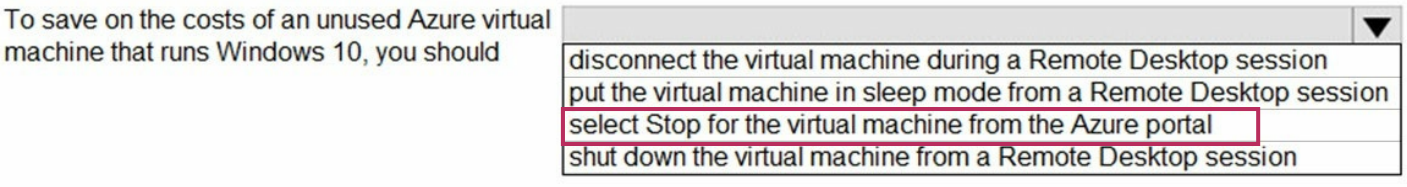
Reference:

https://docs.microsoft.com/en-us/shows/azure-videos/virtual-spot-machines-overview

Question: 343 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area

To save on the costs of an unused Azure virtual machine that runs Windows 10, you should

- disconnect the virtual machine during a Remote Desktop session
- put the virtual machine in sleep mode from a Remote Desktop session
- **select Stop for the virtual machine from the Azure portal**
- shut down the virtual machine from a Remote Desktop session

Explanation:

Select stop for the Virtual machine from the Azure portal.

Shutting down the machine from the OS is not enough, you will still be paying for the Azure VM compute resources (aka hardware allocation).

Question: 344

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

All Azure services that are in public preview are

- provided without any documentation.
- only configurable from Azure CLI.
- **excluded from the Service Level Agreements.**
- only configurable from the Azure portal.

Answer:

Azure Preview Terms & Policies: Under Microsoft's Supplemental Terms of Use for Microsoft Azure Previews, pre-release features and services provided in public preview are intended for evaluation, testing, and feedback purposes.

Answer Area

Microsoft explicitly excludes preview services from formal Service Level Agreements (SLAs), meaning they carry no financially backed uptime commitments, service credit remedies, or standard production technical support coverage.

All Azure services that are in public preview are

- provided without any documentation.
- only configurable from Azure CLI.
- **excluded from the Service Level Agreements.**
- only configurable from the Azure portal.

Explanation:

"excluded from SLA" is the answer.

https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms

Public preview – During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal

service level agreements do not apply.

Public preview " During this phase we allow any customer with the proper Azure AD license to evaluate the new feature. Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply.

Reference:

https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms

Question: 345 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for

- compute capacity
- I/O operations
- networking
- storage

Answer:

Answer Area

If an Azure virtual machine has a status of Stopped (deallocated), you will continue to pay for

- compute capacity
- I/O operations
- networking
- storage

Explanation:
Box: storage -
Azure doesn't charge for the VM core hours while it is Stopped (Deallocated). However, you continue to accrue charges for the Azure storage needed for the VM's
OS disk and any attached data disks.

Reference:
https://www.parkmycloud.com/does-azure-charge-for-stopped-vm/

Question: 346 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

The [ ] explains what data Microsoft processes, how Microsoft processes the data, and the purpose of processing the data.

- Microsoft Online Services Privacy Statement
- Microsoft Product Terms
- Microsoft Online Service Level Agreement
- Online Subscription Agreement for Microsoft Azure

Answer:

Answer Area

The [Microsoft Online Services Privacy Statement] explains what data Microsoft processes, how Microsoft processes the data, and the purpose of processing the data.

Explanation:
Box: Microsoft Online Services Privacy Statement

Microsoft Privacy Statement -
Your privacy is important to us. This privacy statement explains the personal data Microsoft processes, how Microsoft processes it, and for what purposes.

Reference:
https://privacy.microsoft.com/en-us/privacystatement

Question: 347 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Service Trust Portal & Compliance Manager Evolution: When Compliance Manager was initially introduced, it was delivered as a dashboard feature hosted directly within the Microsoft Service Trust Portal (STP). The Service Trust Portal serves as the central repository for Microsoft cloud audit reports, compliance guides, and regulatory assessment tools.

You can access Compliance Manager from the [ ]

- Azure Active Directory admin center
- Azure portal
- Microsoft 365 admin center
- Microsoft Service Trust Portal

Microsoft later migrated Compliance Manager into the Microsoft Purview compliance portal (compliance.microsoft.com).

Within the specific set of legacy options provided, Microsoft Service Trust Portal is the intended platform tied to Compliance Manager in foundational exam items

Answer:

Answer Area

You can access Compliance Manager from the [▼]

- Azure Active Directory admin center
- Azure portal
- Microsoft 365 admin center
- Microsoft Service Trust Portal

Explanation:

Box: Microsoft 365 admin center -

1. Go to the Microsoft 365 compliance center and sign in with your Microsoft 365 global administrator account.

2. Select Compliance Manager on the left navigation pane. You'll arrive at your Compliance Manager dashboard.

Note:- Compliance Manager has moved from the Service Trust Portal to the Microsoft Purview compliance portal.

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/compliance-manager-setup

Question: 348

CertyIQ

You have 1,000 virtual machines hosted on the Hyper-V hosts in a data center.
You plan to migrate all the virtual machines to an Azure pay-as-you-go subscription.
You need to identify which expenditure model to use for the planned Azure solution.
Which expenditure model should you identify?

A. scalable
B. operational
C. elastic
D. capital

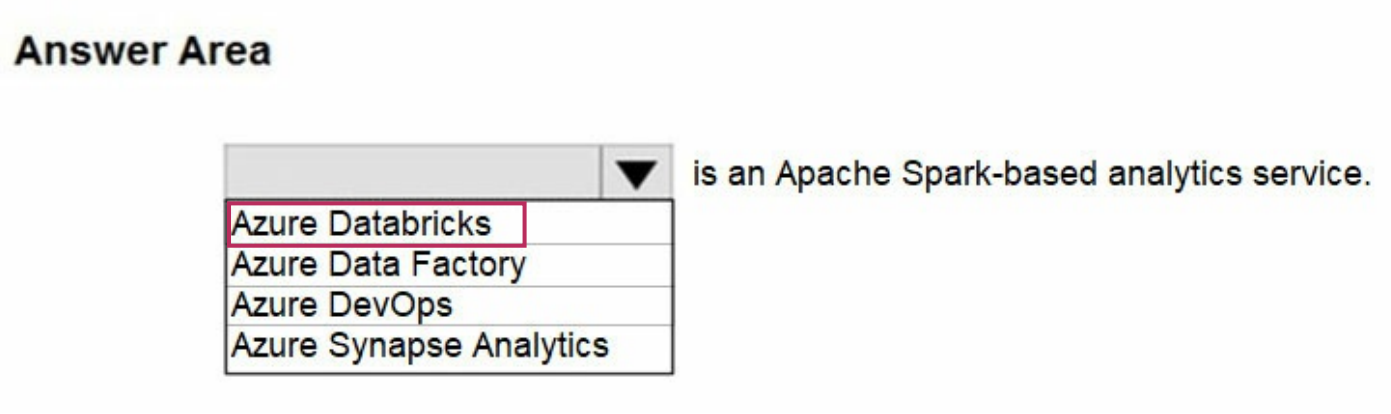
Answer: B

Explanation:
One of the major changes that you will face when you move from on-premises cloud to the public cloud is the switch from capital expenditure (buying hardware) to operating expenditure (paying for service as you use it). This switch also requires more careful management of your costs. The benefit of the cloud is that you can fundamentally and positively affect the cost of a service you use by merely shutting down or resizing it when it's not needed.

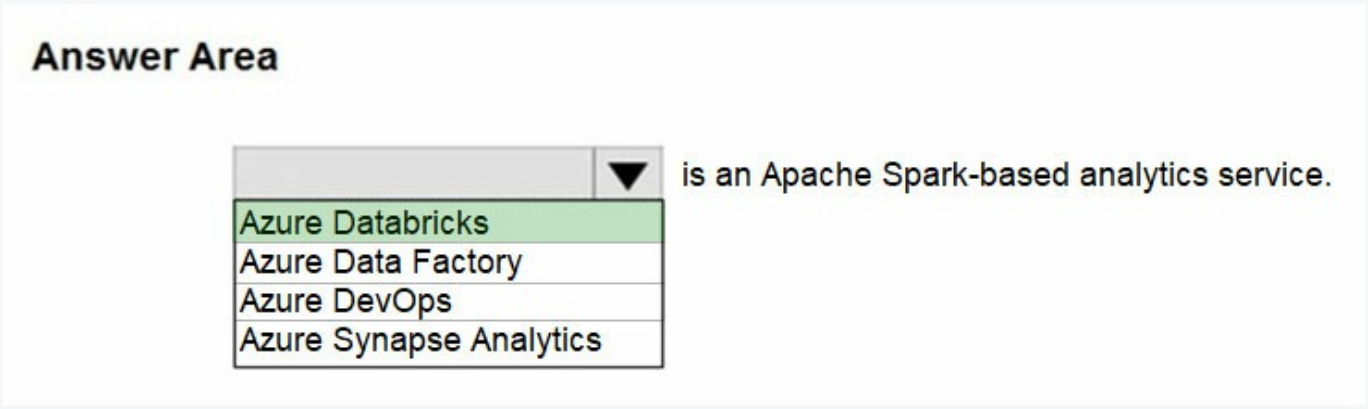
Reference:
https://docs.microsoft.com/en-us/azure/architecture/cloud-adoption/appendix/azure-scaffold

Question: 349 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

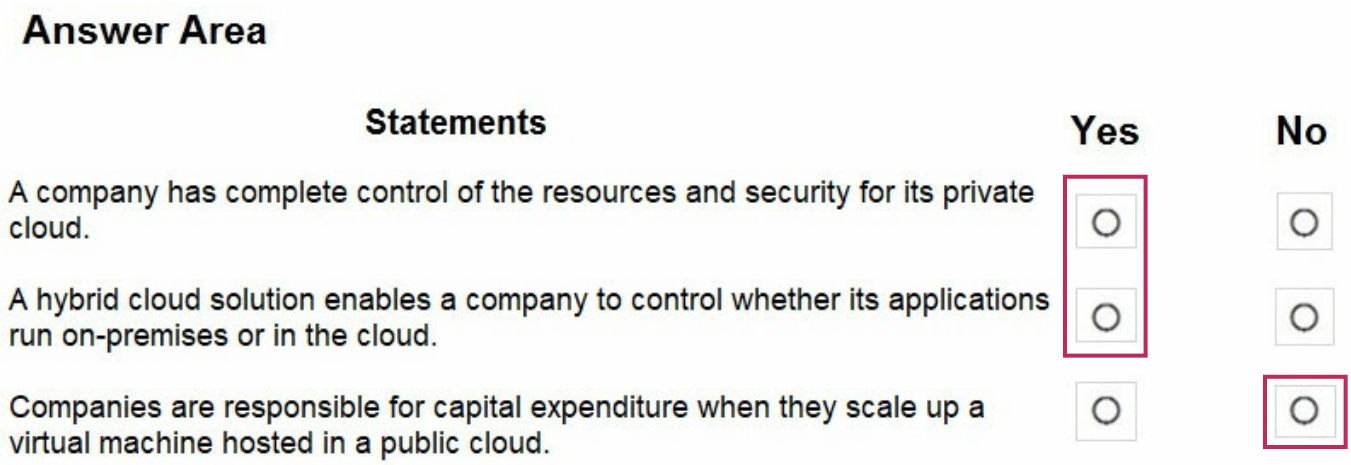


Answer:



Question: 350 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:



Answer:

Answer Area

Statements	Yes	No
A company has complete control of the resources and security for its private cloud.	○	○
A hybrid cloud solution enables a company to control whether its applications run on-premises or in the cloud.	○	○
Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud.	○	○

Explanation:

A company has complete control of the resources and security for its private cloud - **Yes**

A Hybrid Cloud solution enables a company to control whether its applications run on-premises or in the cloud - **Yes**

Explanation: Hybrid cloud computing enables an enterprise to deploy its most sensitive workloads in an on-premises cloud and to host less-critical resources on a third-party public cloud provider. This approach allows organizations to get the best of both private and public cloud models.

Companies are responsible for capital expenditure when they scale up a virtual machine hosted in a public cloud - **No**

Explanation: With the public cloud, you get pay-as-you-go pricing – you pay only for what you use, no CapEx costs.

Question: 351 CertyIQ

Which Service Level Agreement (SLA) is provided for Azure services in public preview?

A. Each service defines its own SLA

B. The SLA will be 99%

C. The SLA will be 1% less than the general availability (GA) SLA

D. The SLA will be 99.95%

Azure Preview SLA Policy: Microsoft's formal licensing terms state:
"PREVIEWS ARE PROVIDED 'AS-IS,' 'WITH ALL FAULTS,' AND 'AS AVAILABLE,' AND ARE EXCLUDED FROM THE SERVICE LEVEL AGREEMENTS AND LIMITED WARRANTY."

Answer: A

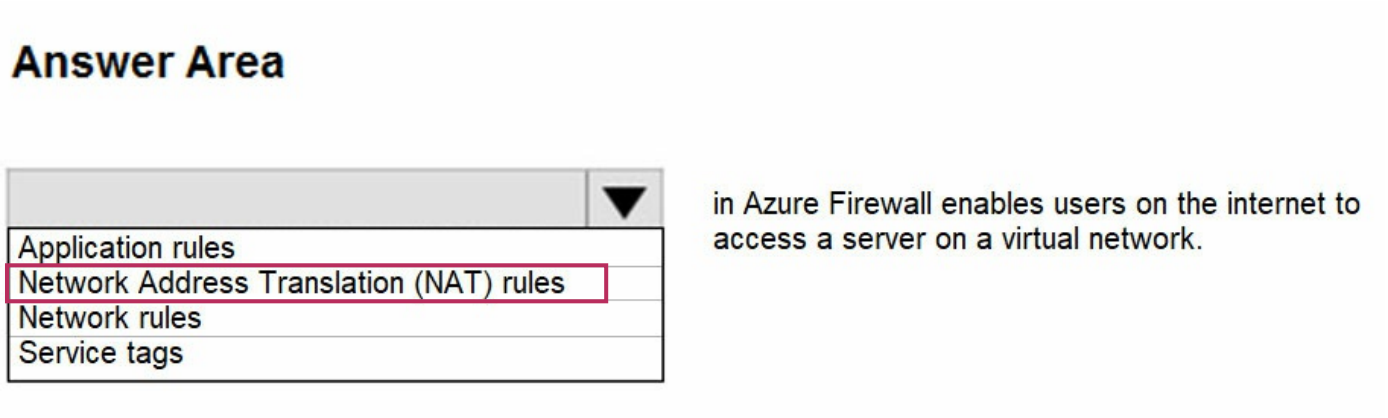
Explanation: Because there is no standard universal uptime SLA (such as 99% or 99.95%) across previews, and because preview conditions and terms are detailed individually per service release note or preview agreement, question item writers constructed "Each service defines its own SLA" as the distractor-eliminating answer to rule out fixed percentages (B, C, and D).

Microsoft Customer Support Services will supply support services during this phase, but normal service level agreements do not apply

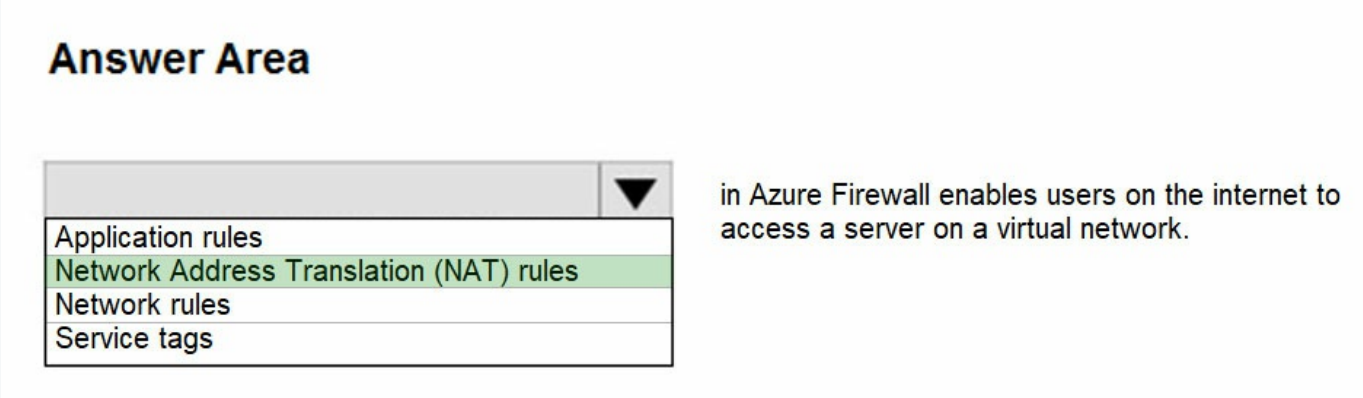
https://azure.microsoft.com/en-us/support/legal/preview-supplemental-terms/#:~:text=Public%20preview%20%E2%80%93%20During%20this%20phase%20we%20allow%20any%20cu

Question: 352 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:



Answer:



Explanation:

"NAT rules" is the answer.

https://learn.microsoft.com/en-us/azure/firewall/policy-rule-sets#dnat-rules

DNAT rules allow or deny inbound traffic through the firewall public IP address(es). You can use a DNAT rule when you want a public IP address to be translated into a private IP address. The Azure Firewall public IP addresses can be used to listen to inbound traffic from the Internet, filter the traffic and translate this traffic to internal resources in Azure.

Question: 353

Statement 2 (Yes): An Enterprise Agreement (EA) requires an upfront annual financial commitment known as the Azure Prepayment (formerly Monetary Commitment). Customers commit to a predetermined spend amount each year in exchange for discounted enterprise rates.

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 2 (Yes): An Enterprise Agreement (EA) requires an upfront annual financial commitment known as the Azure Prepayment (formerly Monetary Commitment). Customers commit to a predetermined spend amount each year in exchange for discounted enterprise rates.

Answer Area

Statements	Yes	No
The cost of outbound traffic from Azure is the same for all Azure regions.	○	○
Purchasing Azure services through an Enterprise Agreement (EA) requires you to spend a predetermined amount.	○	○
Microsoft defines the pricing structure of all third-party services sold through Azure Marketplace.	○	○

Answer:

Statement 3 (No): In the Azure Marketplace, third-party Independent Software Vendors (ISVs) publish and configure their own offer terms, license structures, and pricing models (e.g., BYOL, hourly, monthly, or tiered subscriptions). Microsoft provides the commercial billing engine and storefront, but does not dictate third-party vendor prices.

Answer Area

Statements	Yes	No
The cost of outbound traffic from Azure is the same for all Azure regions.	○	○
Purchasing Azure services through an Enterprise Agreement (EA) requires you to spend a predetermined amount.	○	○
Microsoft defines the pricing structure of all third-party services sold through Azure Marketplace.	○	○

Explanation:

Box 1: No -

Within most of the areas, there are clearly more expensive regions and less expensive regions.

The least expensive regions, on average across these instance types are us-west-2, us-west-central, and korea-south.

The most expensive regions are asia-pacific-east, japan-east, and australia-east.

Box 2: Yes -

Many organizations with Microsoft Enterprise Agreements (EA) are adding Azure to their EA to enjoy the benefits it offers, such as:

Minimizing Azure upfront costs by locking in pricing with consumption pre-commitment

Using Azure EA Portal to manage Azure Subscriptions easily and organize them under a single billing account

Box 3: No

The commercial marketplace operates on an agency model, whereby publishers set prices, Microsoft bills customers, and Microsoft pays revenue to publishers while withholding an agency fee.

Question: 354

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Pay-As-You-Go (PAYG) is a consumption-based model.	○	○
Payments to cloud service providers are considered capital expenditures (CapEx).	○	○
The services provided through a consumption-based model are considered operational expenditures (OpEx).	○	○

Answer:

Answer Area

Statements	Yes	No
Pay-As-You-Go (PAYG) is a consumption-based model.	○	○
Payments to cloud service providers are considered capital expenditures (CapEx).	○	○
The services provided through a consumption-based model are considered operational expenditures (OpEx).	○	○

Explanation:
Box 1: Yes -
The Pay as You Go model is billed on a per second basis and you can start or stop the service at any time " paying only for what you use.

Box 2: No -
No, it is OpEx (Operational Expenditures).
OpEx: The business can achieve ROI immediately in many cases because the infrastructure is managed by the cloud provider.
CapEx: ROI is not usually realized until a long time after the purchase was made because the infrastructure needs to be set up and employees need to be trained.
Computers, servers, and other hardware needed for on-premises data centers are all examples of CapEx.

Box 3: Yes -
Operational Expenditures (OpEx) are the ongoing costs related to day-to-day operations. A subscription fee for cloud services is considered OpEx"the cloud provider is making the infrastructure investment upfront, and you only pay for the resources you need as you need them.

Reference:
https://azure.microsoft.com/en-us/pricing/purchase-options/pay-as-you-go/
https://blogs.vmware.com/cloudhealth/capex-vs-opex-cloud-cost-management/

Question: 355 CertyIQ

What is the longest term you can purchase for Azure Reserved VM instances?

A. one year
B. five years
C. four years
D. three years

Answer: D

Explanation:
Azure Reservations help you save money by committing to one-year or three-year plans for multiple products. Committing allows you to get a discount on the resources you use. Reservations can significantly reduce your resource costs by up to 72% from pay-as-you-go prices.

Reference:
https://docs.microsoft.com/en-us/azure/cost-management-billing/reservations/save-compute-costs-reservations

Question: 356

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
All Azure services in private preview must be accessed by using a separate Azure portal.	○	○
Azure services in public preview can be used in production environments.	○	○
Azure services in public preview are subject to a Service Level Agreement (SLA).	○	○

Answer:

Answer Area

Statements	Yes	No
All Azure services in private preview must be accessed by using a separate Azure portal.	○	○
Azure services in public preview can be used in production environments.	○	○
Azure services in public preview are subject to a Service Level Agreement (SLA).	○	○

Explanation:
Public Preview means that the service is in public beta and can be tried out by anyone with an Azure subscription. Services in public preview are often offered at a discount price.

Box 1: No -
Services in private preview can be viewed in the regular Azure portal. However, you need to be signed up for the feature in private preview before you can view it.
Access to private preview features is usually by invitation only.

Box 2: Yes -
You can use services in public preview in production environments. However, you should be aware that the service may have faults, is not subject to an SLA and may be withdrawn without notice.

Box 3: No -
Public previews are excluded from SLAs and in some cases, no support is offered.

Reference:
https://www.neowin.net/news/several-more-azure-services-now-available-in-private-public-preview/

Question: 357

CertyIQ

Your company has 10 offices. You plan to generate several billing reports from the Azure portal. Each report will contain the Azure resource utilization of each office.
Which Azure Resource Manager feature should you use before you generate the reports?

A. tags
B. templates
C. locks
D. policies

Azure Resource Manager (ARM) Tags: Tags are key-value pairs applied directly to Azure resources, resource groups, and subscriptions to logically organize assets into a taxonomy.

In billing and cost management scenarios, tags allow organizations to categorize resource usage and costs by department, business unit, environment, cost center, or office location (e.g., Office: Colombo, Office: London).

When generating billing and cost analysis reports in Microsoft Cost Management, administrators can filter and group costs by these specific tag keys to produce per-office utilization reports.

Answer: A

Explanation:

You can use resource tags to 'label' Azure resources. Tags are metadata elements attached to resources. Tags consist of pairs of key/value strings. In this question, we would tag each resource with a tag to identify each office. For example: Location = Office1. When all Azure resources are tagged, you can generate reports to list all resources based on the value of the tag. For example: All resources used by Office1.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/decision-guides/resource-tagging/

Question: 358

CertyIQ

Statement 1 (No): Every Azure account, including the Azure free account, includes only the Basic support plan at no additional cost. Paid support tiers such as Developer, Standard, and Professional Direct require separate monthly paid subscriptions.

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 2 (No): A Premier/Unified support plan is an organization-wide Microsoft contract that is not restricted strictly to customers with an Enterprise Agreement (EA). It can be acquired via Microsoft Customer Agreements (MCA), partner channels, or standalone enterprise services agreements.

Statements	Yes	No
A Standard support plan is included in an Azure free account.	○	○
A Premier support plan can only be purchased by companies that have an Enterprise Agreement (EA).	○	○
Support from MSDN forums is only provided to companies that have a pay-as-you-go subscription.	○	○

Statement 3 (No): Community forum support (formerly MSDN/TechNet, now Microsoft Q&A) is open and accessible to the public at large. Any user, regardless of whether they have a Free account, Pay-As-You-Go, EA, or no active subscription at all, can post and receive community-based technical assistance.

Answer:

Answer Area

Statements	Yes	No
A Standard support plan is included in an Azure free account.	○	○
A Premier support plan can only be purchased by companies that have an Enterprise Agreement (EA).	○	○
Support from MSDN forums is only provided to companies that have a pay-as-you-go subscription.	○	○

Explanation:

Box 1: No -

An Azure free account comes with a 'basic' support plan, not a 'standard' support plan.

Box 2: Yes -

You can purchase the Professional Direct, Standard, and Developer support plans with the Microsoft

Customer Agreement. You can also purchase the

Professional and Standard support plans with the Enterprise Agreement.

Box 3: No -

Users with any type of Azure subscription (pay-as-you-go, Enterprise Agreement, Microsoft Customer Agreement etc.) can get support from the MSDN forums.

References:

https://azure.microsoft.com/en-us/support/plans/

Question: 359 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
If Microsoft plans to end support for an Azure service that does NOT have a successor service, Microsoft will provide notification at least 12 months before.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed.
B. 6 months
C. 90 days
D. 30 days

Answer: A

Explanation:
The Modern Lifecycle Policy covers products and services that are serviced and supported continuously. For products governed by the Modern Lifecycle Policy,
Microsoft will provide a minimum of 12 months' notification prior to ending support if no successor product or service is offered"excluding free services or preview releases.

Reference:
https://support.microsoft.com/en-us/help/30881

Question: 360 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Statement 1 (No): In Azure, the Owner role is an Azure Role-Based Access Control (Azure RBAC) control-plane role granting full management permissions over resources and role assignments within that subscription. However, transferring billing ownership of an Azure subscription requires Billing Account Administrator permissions (such as the original Account Administrator or Billing Profile Owner), not merely the RBAC Owner role.

Statement 2 (Yes): An Azure Free Trial or Free Account can be explicitly upgraded to a Pay-As-You-Go subscription directly via the Azure portal under Subscriptions $\rightarrow$ Upgrade subscription, removing the credit limit and transitioning running workloads seamlessly to standard billing.

Statement 3 (Yes): The Azure spending limit feature (included on Free accounts and Visual Studio benefit subscriptions) is set to a fixed value equal to the credit amount ($0 beyond credits). Microsoft does not allow administrators to customize, increase, or decrease this spending limit to a custom numerical dollar amount (e.g., changing it from $0 to $50); it can only be removed entirely (or turned back on).

Answer Area

Statements	Yes	No
A user who is assigned the Owner role can transfer ownership of an Azure subscription.	○	○
You can convert the Azure subscription of your company from Free Trial to Pay-As-You-Go.	○	○
The Azure spending limit is fixed and cannot be increased or decreased.	○	○

Answer:

Answer Area

Statements	Yes	No
A user who is assigned the Owner role can transfer ownership of an Azure subscription.	○	○
You can convert the Azure subscription of your company from Free Trial to Pay-As-You-Go.	○	○
The Azure spending limit is fixed and cannot be increased or decreased.	○	○

Explanation:

Box 1: No -

You need to be an administrator of the billing account that has the subscription to be able to transfer the subscription. This could be a Billing Administrator or

Global Administrator. A subscription owner can manage all resources and permissions within the subscription but cannot transfer ownership of the subscription.

Box 2: Yes -

You can convert a free trial subscription to Pay-As-You-Go. This is common practice for people who wish to continue using the Azure services when the free trial period expires.

Box 3: Yes -

You can remove the spending limit, but you can't increase or decrease it.

The spending limit in Azure prevents spending over your credit amount. All new customers who sign up for an Azure free account or subscription types that include credits over multiple months have the spending limit turned on by default. The spending limit is equal to the amount of credit and it can't be changed. For example, if you signed up for Azure free account, your spending limit is $200 and you can't change it to $500. However, you can remove the spending limit. So, you either have no limit, or you have a limit equal to the amount of

credit.

Reference:

https://docs.microsoft.com/en-us/azure/billing/billing-add-change-azure-subscription-administrator
https://docs.microsoft.com/en-us/azure/billing/billing-upgrade-azure-subscription
https://docs.microsoft.com/en-us/azure/billing/billing-spending-limit

Question: 361 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Answer Area

Statements	Yes	No
With Azure Reservations, you pay less for virtual machines than with pay-as-you-go pricing.	○	○
Two Azure virtual machines that use the B2S size have the same monthly costs.	○	○
When an Azure virtual machine is stopped, you continue to pay storage costs for the virtual machine.	○	○

Statement 2 (No): The cost of two identical VM sizes (such as B2S) can differ based on multiple factors:
Region: Azure compute rates vary across datacenters worldwide due to regional operational and infrastructure costs.
Operating System / Licensing: A B2S instance running Windows Server incurs additional OS licensing fees compared to a B2S instance running Linux (unless Azure Hybrid Benefit applies).
Storage Configuration: Attached managed disks (Standard HDD vs. Premium SSD) and disk size impact total monthly cost.

Answer:

Answer Area

Statements	Yes	No
With Azure Reservations, you pay less for virtual machines than with pay-as-you-go pricing.	○	○
Two Azure virtual machines that use the B2S size have the same monthly costs.	○	○
When an Azure virtual machine is stopped, you continue to pay storage costs for the virtual machine.	○	○

Explanation:
Box 1: Yes -
A reservation is where you commit to pay for a resource (for example a virtual machine) for one or three years. This gives you a discounted price on the resource for the reservation period.

Box 2: No -
There are other factors that influence the cost of a virtual machine such as the virtual hard disks attached to the virtual machine. You could have multiple virtual machines with the same 'size' (B2S in this case) but with different virtual hard disk configurations.

Box 3: Yes -
When a virtual machine is stopped (deallocated), the virtual machine is unloaded/dismounted from the physical server in Azure. In this state, you are not charged for the virtual machine itself. However, you are still charged for the storage costs of the virtual hard disks attached to the virtual machine.
If the virtual machine is stopped but not deallocated (this happens if you shut down the virtual machine from the operating system of the virtual machine), the virtual machine is still mounted on the physical server in Azure and you are charged for the virtual machine itself as well as the storage costs. To ensure that a virtual machine is 'stopped (deallocated)', you need to stop the virtual machine in the Azure portal.

Reference:

https://azure.microsoft.com/en-us/reservations/
https://docs.microsoft.com/en-us/azure/virtual-machines/linux/b-series-burstable
https://blogs.technet.microsoft.com/uspartner_ts2team/2014/10/10/azure-virtual-machines-stopping-versus-stopping-deallocating/

Question: 362 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused network interfaces.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
You are not charged for unused network interfaces. Therefore, deleting unused network interfaces will not reduce the Azure costs for the company.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 363 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)

Five groups in Azure AD -

- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused public IP addresses.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
You are charged for public IP addresses. Therefore, deleting unused public IP addresses will reduce the Azure costs.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 364 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused user accounts.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
You are not charged for user accounts. Therefore, deleting unused user accounts will not reduce the Azure costs for the company.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 365 CertyIQ

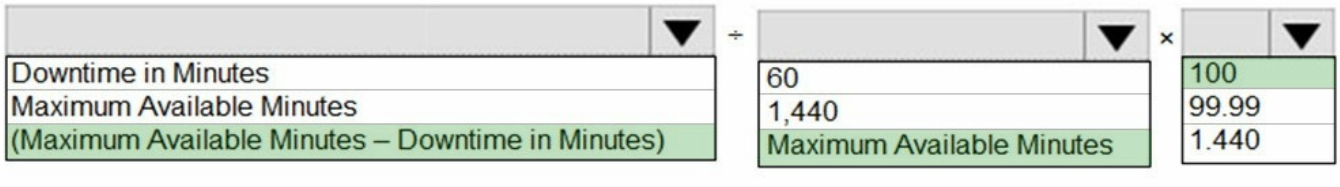
HOTSPOT -
How should you calculate the monthly uptime percentage? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Downtime in Minutes Maximum Available Minutes (Maximum Available Minutes – Downtime in Minutes)	÷	60 1,440 Maximum Available Minutes	×	100 99.99 1.440

Answer:

Answer Area



Explanation:
"Maximum Available Minutes" is the total accumulated minutes during a billing month .
"Downtime" is the total accumulated minutes that are part of Maximum Available Minutes where a system is unavailable.
"Monthly Uptime Percentage" for a service is calculated as Maximum Available Minutes less Downtime divided by Maximum Available Minutes x 100.
Monthly Uptime Percentage is represented by the following formula:
Monthly Uptime % = (Maximum Available Minutes-Downtime) / Maximum Available Minutes x 100.

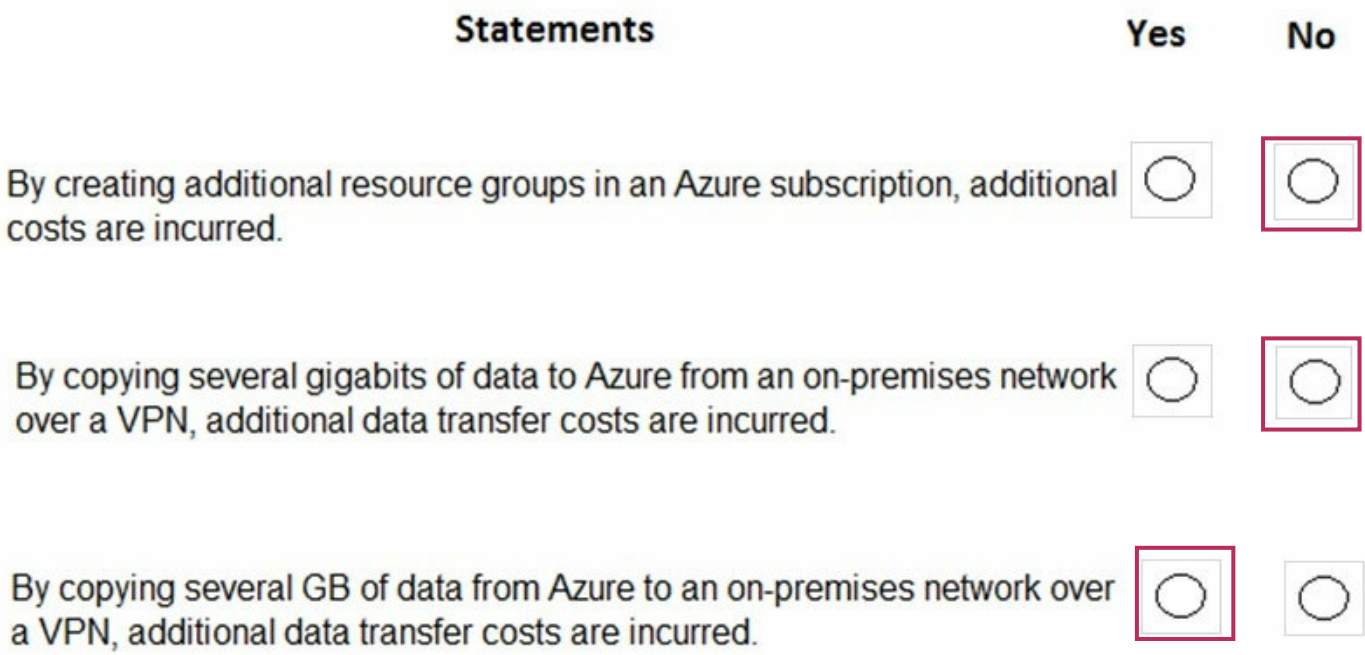
Reference:
https://azure.microsoft.com/en-au/support/legal/sla/cloud-services/v1_0/

Question: 366

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area



Answer:

Answer Area

Statements	Yes	No
By creating additional resource groups in an Azure subscription, additional costs are incurred.	○	●
By copying several gigabits of data to Azure from an on-premises network over a VPN, additional data transfer costs are incurred.	○	●
By copying several GB of data from Azure to an on-premises network over a VPN, additional data transfer costs are incurred.	●	○

Explanation:

Box 1: No -

Resource groups are logical containers for Azure resources. You do not pay for resource groups.

Box 2: No -

Data ingress over a VPN is data 'coming in' to Azure over the VPN. You are not charged data transfer costs for data ingress.

Box 3: Yes -

Data egress over a VPN is data 'going out' of Azure over the VPN. You are charged for data egress.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/manage-resource-groups-portal https://azure.microsoft.com/en-us/pricing/details/bandwidth/ https://azure.microsoft.com/en-us/pricing/details/bandwidth/

Question: 367 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
A support plan solution that gives you best practice information, health status and notifications, and 24/7 access to billing information at the lowest possible cost is a Standard support plan.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Developer
C. Basic
D. Premier

Azure Basic Support Plan: The Basic tier is included automatically with every Microsoft Azure account at no additional cost ($0/month), making it the lowest possible cost tier.

It includes:

24/7 access to billing and subscription management support via web ticket/phone.
Access to Azure Advisor recommendations (best practice information across cost, security, reliability, operational excellence, and performance).
Access to the Azure Service Health dashboard and notifications.
Community support via Microsoft Q&A and documentation.

Answer: C

Explanation:

A basic support plan provides:

Because the scenario only requests billing access, health notifications, and best practices (and not technical break-fix support for core Azure services/workloads), the free Basic plan satisfies all criteria.

✑ 24x7 access to billing and subscription support, online self-help, documentation, whitepapers, and support forums
✑ Best practices: Access to full set of Azure Advisor recommendations
✑ Health Status and Notifications: Access to personalized Service Health Dashboard & Health API

Reference:
https://azure.microsoft.com/en-us/support/plans/

Question: 368 CertyIQ

In which Azure support plans can you open a new support request?

A. Premier and Professional Direct only
B. Premier, Professional Direct, and Standard only
C. Premier, Professional Direct, Standard, and Developer only
D. Premier, Professional Direct, Standard, Developer, and Basic

While the Basic plan does not include technical break-fix support for workloads and infrastructure, it explicitly permits opening support tickets for:

Answer: D

Explanation:

Billing and invoicing inquiries,Subscription management,Service and subscription limit (quota) increases
Because the question asks generally about opening a "new support request" without restricting the scope strictly to technical break-fix requests, all plans qualify.

You can submit support request tickets in the following plans: Premier, Professional Direct, Standard, Developer, and Basic.

Reference:

https://azure.microsoft.com/en-us/support/plans/

Question: 369 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
You can create an Azure support request from support.microsoft.com.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed.` If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed.
B. the Azure portal
C. the Knowledge Center
D. the Security & Compliance admin center

Azure Support Ticketing Location: All Azure customer support requests—including technical break-fix incidents, billing inquiries, subscription transfers, and quota increase requests—are officially raised through the Azure portal (portal.azure.com) by navigating to the Help + support menu.

Integrating the ticket submission engine directly into the Azure portal allows the support workflow to automatically correlate tenant IDs, subscription IDs, resource IDs, and diagnostics directly from the active cloud session.

Answer: B

Explanation:

The general consumer web portal (support.microsoft.com) is designated for end-user consumer software products (such as Windows, Xbox, Office, and consumer Microsoft accounts), not for managing enterprise Azure cloud infrastructure tickets.

You can create an Azure support request from the Help and Support blade in the Azure portal or from the context menu of an Azure resource in the Support + Troubleshooting section.

Reference:
https://docs.microsoft.com/en-us/azure/azure-supportability/how-to-create-azure-support-request

Question: 370 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your company has an Azure subscription that contains the following unused resources:
- 20 user accounts in Azure Active Directory (Azure AD)
- Five groups in Azure AD
- 10 public IP addresses
- 10 network interfaces

You need to reduce the Azure costs for the company.
Solution: You remove the unused groups.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
You are not charged for Azure Active Directory Groups. Therefore, deleting unused groups will not reduce your Azure costs.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations#reduce-costs-by-deleting-or-reconfiguring-idle-virtual-network-gateways

Question: 371 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
The Azure Standard support plan is the lowest cost option to receive 24x7 access to support engineers by phone.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Developer
C. Basic
D. Professional Direct

Azure Support Tier Capabilities:

Basic ($0/month): No technical support engineers; access is restricted to self-help, documentation, billing, and subscription management support.

Developer (~$29/month): Provides technical support during business hours only via email; it does not include 24x7 coverage or phone access.

Standard (~$100/month): Designed for production workloads, providing 24x7 access to support engineers by both phone and email for technical break-fix issues. It is the cheapest tier offering this capability.

Professional Direct (~$1,000/month): Also includes 24x7 phone access, but at a substantially higher cost with architectural guidance and faster initial response times.

Answer: A

Explanation:
The Basic support plan is free so is therefore the cheapest. The Developer support plan is the cheapest paid-for support plan. The order of support plans in terms of cost ranging from the cheapest to most expensive is: Basic, Developer, Standard, Professional Direct, Premier.

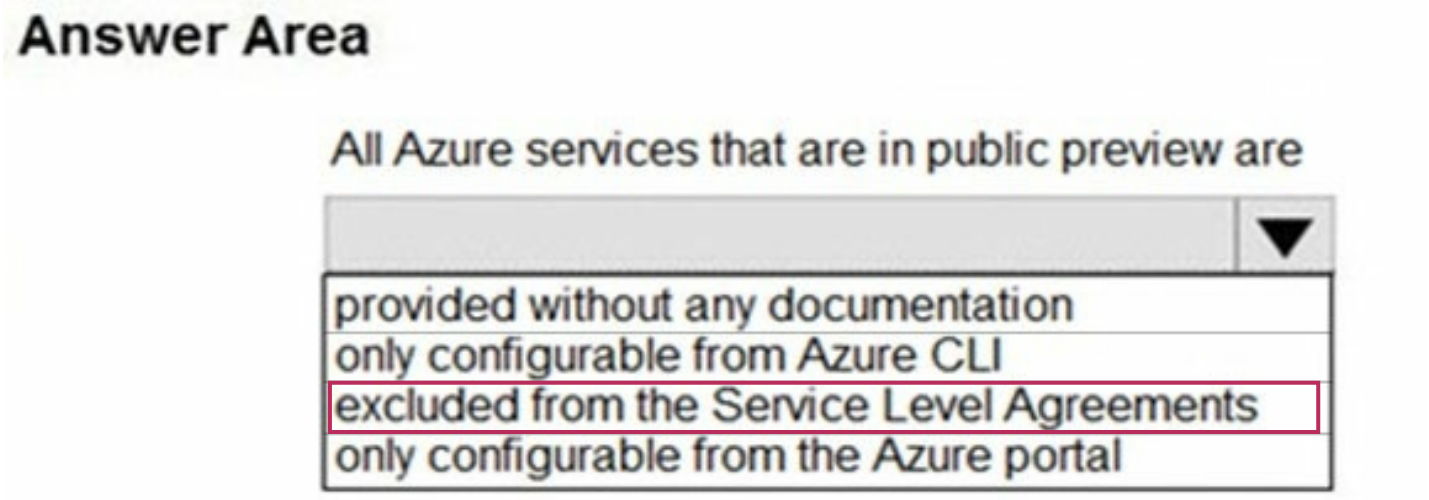
However, 24/7 access to technical support by email and phone is only available for Standard, Professional Direct, Premier plans.

Reference:

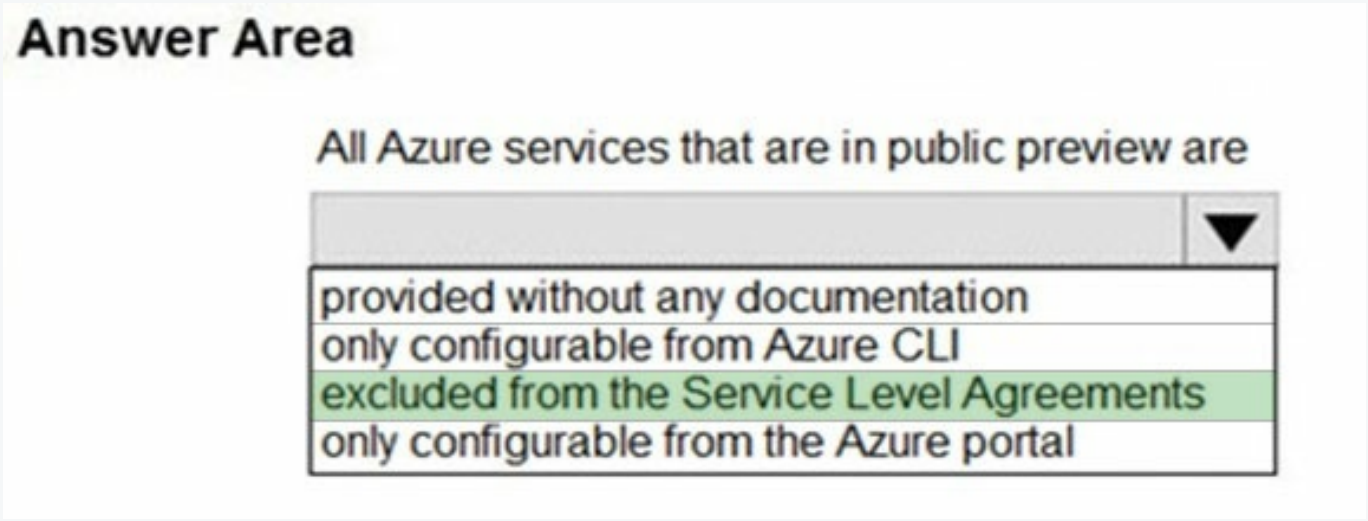
https://azure.microsoft.com/en-gb/support/plans/

Question: 372 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:



Answer:



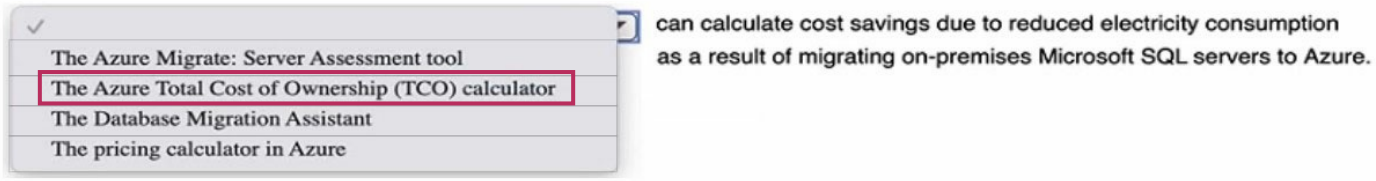
Explanation:
Preview features are made available to you on the condition that you accept additional terms which supplement the regular Azure terms. The supplemental terms state:
PREVIEWS ARE PROVIDED "AS-IS," "WITH ALL FAULTS," AND "AS AVAILABLE," AND ARE EXCLUDED FROM THE SERVICE LEVEL AGREEMENTS AND
LIMITED WARRANTY.

Reference:
https://azure.microsoft.com/en-gb/support/legal/preview-supplemental-terms/

Question: 373 CertyIQ

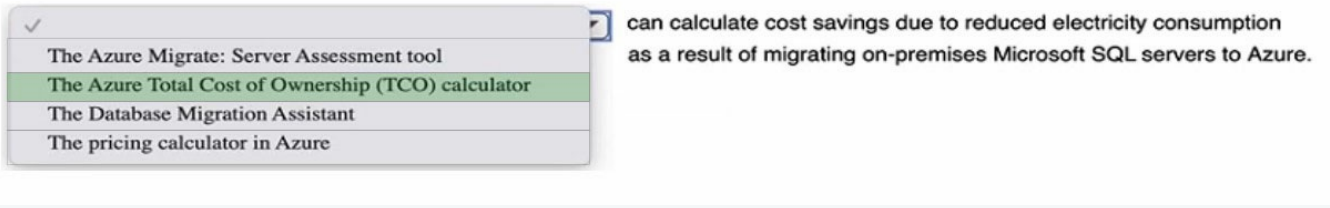
HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area



Answer:

Answer Area



Explanation:

"Azure TCO calculator" is the answer.

https://learn.microsoft.com/en-us/training/modules/describe-cost-management-azure/3-compare-pricing-total-cost-of-ownership-calculators

The TCO calculator is designed to help you compare the costs for running an on-premises infrastructure compared to an Azure Cloud infrastructure. With the TCO calculator, you enter your current infrastructure configuration, including servers, databases, storage, and outbound network traffic. The TCO calculator then compares the anticipated costs for your current environment with an Azure environment supporting the same infrastructure requirements.

Reference:

https://docs.microsoft.com/en-us/learn/modules/plan-manage-azure-costs/2-compare-costs-tco-calculator

Question: 374 CertyIQ

You need to compare a company's cloud usage to industry standard best practices.
What should you use?

A. Azure Monitor
B. Azure Service Health
C. Application Insights in Azure Monitor
D. Azure Advisor

Azure Advisor: Azure Advisor analyzes your deployed resource configurations and usage telemetry to provide actionable, personalized recommendations aligned with the Microsoft Azure Well-Architected Framework.

It evaluates your cloud footprint across five core pillars of best practice:
Cost: Identifies idle or underutilized resources to reduce waste.
Security: Integrates with Microsoft Defender for Cloud to harden security posture.
Reliability (High Availability): Checks for business continuity, fault tolerance, and backup coverage.
Performance: Recommends scaling, provisioning changes, or database indexing to avoid bottlenecks.
Operational Excellence: Advises on deployment best practices, service limits, and workflow efficiencies.

Answer: D

Explanation:

D- "As your personalized cloud consultant, Azure Advisor continually assesses your usage telemetry and resource configuration to check for industry best practices." https://learn.microsoft.com/en-

us/azure/advisor/azure-advisor-score

Question: 375 CertyIQ

You need to start Azure Cloud Shell.
What should you use?

A. the Azure portal
B. Azure Command-Line Interface (CLI)
C. Azure PowerShell
D. an Azure Resource Manager (ARM) template

Answer: A

Explanation:

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

You can access Cloud Shell in three ways:

- Direct link: Open a browser to https://shell.azure.com.

- Azure portal: Select the Cloud Shell icon on the Azure portal

- Code samples: In Microsoft technical documentation and training resources, select the Try It button that appears with Azure CLI and Azure PowerShell code snippets

https://learn.microsoft.com/en-us/azure/cloud-shell/overview

Question: 376 CertyIQ

How many copies of data are maintained by an Azure Storage account that uses locally-redundant storage (LRS)?

A. 3
B. 4
C. 6
D. 9

Answer: A

Explanation:

https://learn.microsoft.com/en-us/azure/storage/common/storage-redundancy#locally-redundant-storage

Locally redundant storage (LRS) replicates your storage account three times within a single data center in the primary region. LRS provides at least 99.999999999% (11 nines) durability of objects over a given year.

Question: 377 CertyIQ

What enables a cloud service to adapt quickly to changing requirements?

A. high availability
B. predictability
C. manageability
D. agility

Answer: D

Explanation:

D is correct. Agility: The ability to react quickly. Cloud services can allocate and deallocate resources quickly. They are provided on-demand via self-service, so vast amounts of computing resources can be provisioned in minutes. There is no manual intervention in provisioning or deprovisioning services.

Question: 378 CertyIQ

What is an example of vertical scaling in a cloud environment?

A. adding an additional CPU to an existing Azure virtual machine
B. adding an additional Azure virtual machine
C. adding an additional Azure Virtual Desktop session host
D. adding an additional Azure App Service instance automatically

Answer: A

Explanation:

Vertical scaling, also known as scaling up or scaling out, is the process of increasing the capacity of a single resource, such as a virtual machine or a database, to meet the demands of a workload. This can be done by adding more resources to the existing resource, such as additional CPUs, memory, or storage.

An example of vertical scaling in a cloud environment is adding an additional CPU to an existing Azure virtual machine. This can be done by modifying the VM's size or configuration to include more CPUs, which will allow it to handle a larger workload or more concurrent requests.

Other examples of vertical scaling in a cloud environment include adding more memory to a database server, or increasing the capacity of a storage volume.

Vertical scaling is typically used to address short-term or temporary increases in workload demand, and is often a faster and simpler way to scale a resource than horizontal scaling, which involves adding additional instances of a resource.

Question: 379 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Microsoft Defender for Cloud can monitor Azure resources and on-premises resources.	◯	◯
All Microsoft Defender for Cloud features are free.	◯	◯
For Microsoft Defender for Cloud, you can download a Regulatory Compliance report.	◯	◯

Defender for Cloud covers hybrid environments. Through Azure Arc and agents, it can monitor on-premises servers, and even resources in other clouds, alongside Azure resources.

Only the free tier (foundational CSPM features such as security recommendations and secure score) is free. The enhanced security features, the Defender plans for servers, storage, databases and so on, are paid.

Statement 3 (Yes): Defender for Cloud includes a dedicated Regulatory Compliance dashboard mapped against industry standards (e.g., ISO 27001, PCI-DSS, SOC 2, CIS benchmarks). Administrators can generate and directly download formatted compliance audit reports (PDF or CSV) to share with external auditors and stakeholders.

Answer:

Answer Area

Statements	Yes	No
Microsoft Defender for Cloud can monitor Azure resources and on-premises resources.	◯	◯
All Microsoft Defender for Cloud features are free.	◯	◯
For Microsoft Defender for Cloud, you can download a Regulatory Compliance report.	◯	◯

Explanation:

Box 1: YES

"Microsoft Defender for Cloud is a Cloud Security Posture Management (CSPM) and Cloud Workload Protection Platform (CWPP) for all of your Azure, on-premises, and multicloud (Amazon AWS and Google GCP) resources." First sentence from https://docs.microsoft.com/en-us/azure/defender-for-cloud/defender-for-cloud-introduction. So first answer should be YES.

Box 2: NO

Defender for Cloud includes Foundational CSPM capabilities for free. You can also enable advanced CSPM capabilities by enabling the Defender CSPM plan.

This means that foundational features are free and Advanced features come as a cost. This negates the statement as clearly not "all Microsoft Defender for cloud features aee free

Box 3: YES

Now in Microsoft Defender for Cloud, you can easily create & download Audit reports for Regulatory Compliance Standards.

Question: 380 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Cloud computing offers lower capital expenditure (CAPEX) costs than on-premises deployments.	○	○
Cloud computing provides the same configuration options as on-premises deployments.	○	○
Cloud computing can scale when a business requires change.	○	○

Answer:

Answer Area

Statements	Yes	No
Cloud computing offers lower capital expenditure (CAPEX) costs than on-premises deployments.	○	○
Cloud computing provides the same configuration options as on-premises deployments.	○	○
Cloud computing can scale when a business requires change.	○	○

Explanation:

Y- Capital expenditures (CapEx) are funds used by a company to acquire, upgrade, and maintain physical assets such as property, plants, buildings, technology, or equipment. These costs are lower in cloud computing than in on-premises deployments.

Y- Cloud computing in general provides the same configuration options as on-premises deployments. If you compare a specific product such as Exchange Online vs. Exchange Server or Azure SQL vs. SQL Server this might not be true. But, you could install Exchange Server on a virtual machine in the cloud to get the same configuration options.

Y- Cloud computing allows to increase or decrease IT resources as needed to meet changing demand. Scalability is one of the hallmarks of the cloud and the primary driver of its exploding popularity with businesses.

Question: 381 CertyIQ

What additional resource is required by an Azure virtual machine?

A. a virtual network
B. a service endpoint
C. Azure Firewall
D. a public IP address

Answer: A

Explanation:

A- Virtual Network is a mandatory resource required by Azure VM Public IP is an additional option for VM. Keyword is "additional resource"

Question: 382 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Functions is an example of a platform as a service (PaaS) cloud service model.	◯	◯
Microsoft 365 is an example of a software as a service (SaaS) cloud service model.	◯	◯
An Azure virtual machine is an example of an infrastructure as a service (IaaS) cloud service model.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Azure Functions is an example of a platform as a service (PaaS) cloud service model.	◯	◯
Microsoft 365 is an example of a software as a service (SaaS) cloud service model.	◯	◯
An Azure virtual machine is an example of an infrastructure as a service (IaaS) cloud service model.	◯	◯

Explanation:

Yes

Yes

Yes

Azure Functions is the new kid on the block in the Azure platform. It's a key ingredient of serverless compute that's needed to achieve the benefits of a cloud PaaS implementation. Azure Functions turns the focus to the value of the code and away from managing infrastructure.

https://learn.microsoft.com/en-us/archive/msdn-magazine/2017/february/azure-serverless-architecture-with-azure-functions

Question: 383 CertyIQ

How many copies of data are maintained by an Azure Storage account that uses geo-redundant storage (GRS)?

A. 3
B. 4
C. 6
D. 9

Answer: C

Explanation:

C is correct: https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy#geo-redundant-storage "Geo-redundant storage (GRS) copies your data synchronously three times within a single physical location in the primary region using LRS. It then copies your data asynchronously to a single physical location in a secondary region that is hundreds of miles away from the primary region."

Question: 384 CertyIQ

What is used to grant permission to Azure Virtual Desktop resources?

A. tags
B. role-based access control (RBAC) roles
C. resource groups
D. application security groups

Azure RBAC for Azure Virtual Desktop: Azure Role-Based Access Control (Azure RBAC) manages access and permissions to Azure resources.

Answer: B

Explanation: In Azure Virtual Desktop (AVD), Microsoft provides built-in RBAC roles (such as Desktop Virtualization User, Desktop Virtualization Contributor, and Desktop Virtualization Reader) to control who can manage host pools, app groups, and workspaces, as well as who can launch and connect to virtual desktop sessions.

In Azure, you can use role-based access control (RBAC) to grant permissions to Azure Virtual Desktop resources. RBAC is a system that allows you to manage access to Azure resources based on roles.

In RBAC, you can define roles that represent a set of permissions, and then assign those roles to users or groups. For example, you can create a role that allows users to view and manage Azure Virtual Desktop resources, and then assign that role to a group of users who need to access those resources.

Question: 385 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): Virtual networks (VNets) in Azure provide complete logical network isolation by default. Even if two VNets are deployed in the exact same Azure region and subscription, workloads in one VNet cannot communicate with workloads in the other unless explicit connectivity—such as Virtual Network Peering, a VPN Gateway, or an intermediate Network Virtual Appliance (NVA)—is configured.

Answer Area

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Virtual networks created in the same resource group must have unique names.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Statement 2 (Yes): Azure Resource Manager (ARM) enforces name uniqueness per resource type within a given resource group. Because the resource URI contains the resource group name and the resource type (Microsoft.Network/virtualNetworks/<vnet-name>), you cannot create two VNets with identical names inside the same resource group.

Answer:

Statement 3 (No): Azure allows multiple virtual networks within the same subscription to use identical or overlapping private IP address spaces (e.g., two separate VNets can both define 10.0.0.0/16). Azure does not prevent provisioning overlapping CIDR blocks at the subscription level, though best practices discourage it if inter-VNet peering or hybrid VPN connections are intended.

Answer Area

Statements	Yes	No
Azure virtual networks deployed to the same Azure region are connected by default.	○	○
Virtual networks created in the same resource group must have unique names.	○	○
The Azure virtual network's address space must be unique within a subscription.	○	○

Explanation:

No

Yes

Yes

Question: 386

CertyIQ

Geo-distribution: The practice of distributing workloads, services, and data across geographically dispersed regional datacenters so traffic is served from locations closest to end users, minimizing latency and complying with regional performance standards.

DRAG DROP

-

Match the cloud computing benefits to the appropriate requirements.

To answer, drag the appropriate benefit from the column on the left to its requirement on the right. Each benefit may be used once, more than once, or not at all.

NOTE: Each correct match is worth one point.

High Availability: Focuses on maintaining service continuity and maximum uptime without human intervention during routine localized hardware faults, power interruptions, or transient resource failures.

Benefits

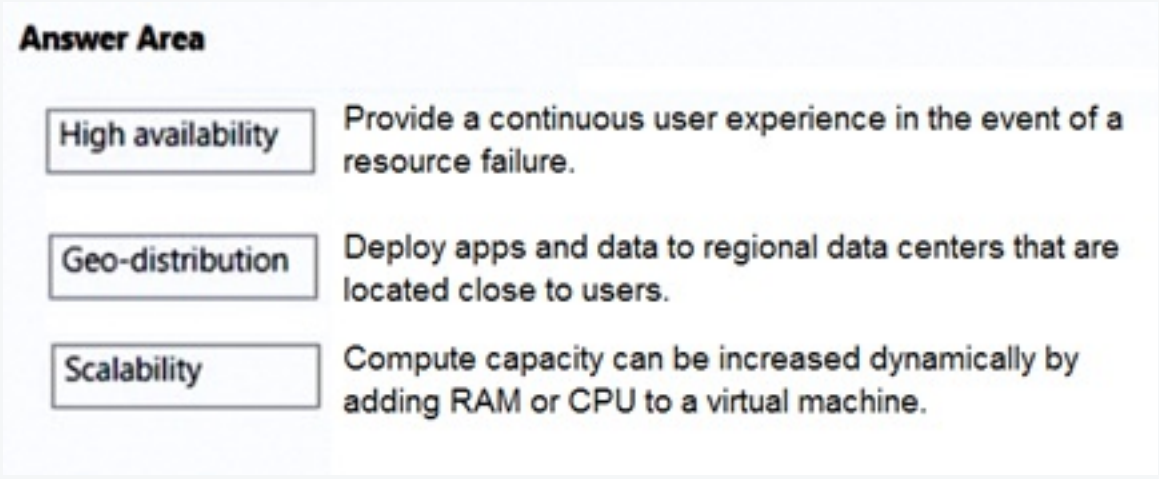
- Disaster recovery
- Geo-distribution
- High availability
- Scalability

Answer Area

High Availability	Benefit	Provide a continuous user experience in the event of a resource failure.
Geo Distribution	Benefit	Deploy apps and data to regional data centers that are located close to users.
Scalability	Benefit	Compute capacity can be increased dynamically by adding RAM or CPU to a virtual machine.

Scalability: The ability of a system to handle increased load by adjusting resource capacity. Adding more compute resources such as CPU or RAM to an existing virtual machine represents vertical scaling (scale up), which falls under the broader cloud benefit of scalability.

Answer:



Explanation:

High availability

When you're deploying an application, a service, or any IT resources, it's important the resources are available when needed. High availability focuses on ensuring maximum availability, regardless of disruptions or events that may occur.

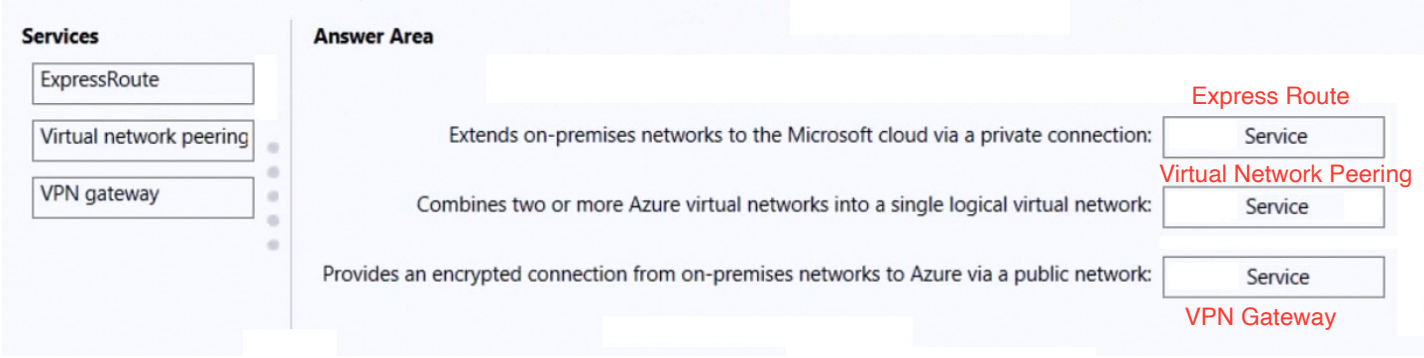
Scalability

Another major benefit of cloud computing is the scalability of cloud resources. Scalability refers to the ability to adjust resources to meet demand. If you suddenly experience peak traffic and your systems are overwhelmed, the ability to scale means you can add more resources to better handle the increased demand.

Question: 387

CertyIQ

DRAG DROP
-
Match the Azure services to the appropriate descriptions.
To answer, drag the appropriate service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Answer Area

Explanation:

1. Extends on-premises networks to the Microsoft cloud via a private connection:

Answer: ExpressRoute

Detailed : Azure ExpressRoute allows you to create private connections between Microsoft datacenters and your on-premises infrastructure or co-location facilities. Crucially, ExpressRoute connections do not go over the public internet. This provides higher reliability, faster speeds, lower latencies, and greater security than typical connections over the internet.

2. Combines two or more Azure virtual networks into a single logical virtual network:

Answer: Virtual network peering

Detailed : Virtual network (VNet) peering enables you to seamlessly connect multiple virtual networks in Azure. Once peered, the VNets appear as a single logical network for connectivity purposes. Traffic between virtual machines in peered VNets uses the private Microsoft backbone infrastructure, maintaining low latency and high bandwidth without requiring a gateway or public internet traversal.

3. Provides an encrypted connection from on-premises networks to Azure via a public network:

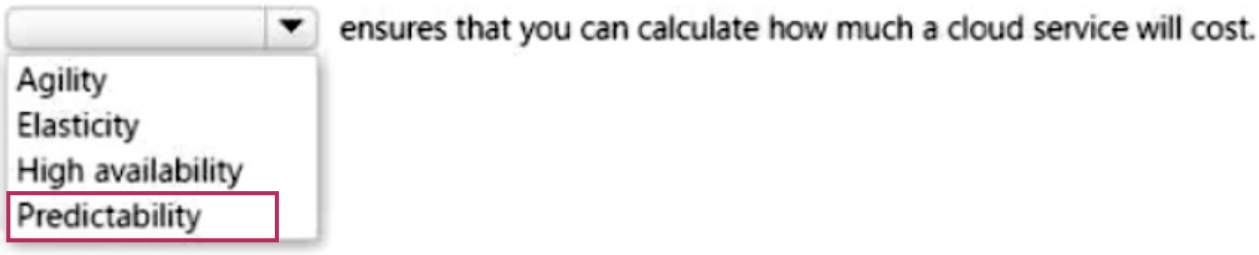
Answer: VPN gateway

Detailed : An Azure VPN Gateway is a specific type of virtual network gateway that is used to send encrypted traffic between an on-premises location and an Azure VNet. Unlike ExpressRoute, this connection travels across the public internet via an encrypted tunnel (typically utilizing IPsec/IKE protocol suites), making it a cost-effective solution for Site-to-Site hybrid connectivity.

Question: 388 CertyIQ

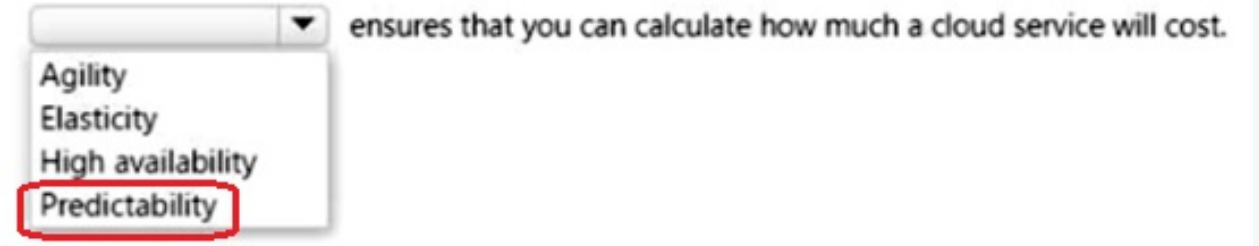
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

Predictability

Predictability in the cloud lets you move forward with confidence. Predictability can be focused on performance predictability or cost predictability. Both performance and cost predictability are heavily influenced by the Microsoft Azure Well-Architected Framework. Deploy a solution that's built around this framework and you have a solution that's cost and performance are predictable.

https://learn.microsoft.com/en-us/training/modules/describe-benefits-use-cloud-services/3-reliability-predictability-cloud

Question: 389 CertyIQ

Which cloud service model minimizes the management responsibility of a customer?

A. infrastructure as a service (IaaS)
B. platform as a service (PaaS)
C. software as a service (SaaS)

Answer: C

Explanation:

Software as a service (SaaS) is a cloud service model that allows customers to access and use software applications over the internet. In the SaaS model, the provider is responsible for managing and maintaining the infrastructure, software, and data associated with the application. The customer pays a subscription fee to use the software and does not need to worry about installing, configuring, or maintaining the software.

SaaS minimizes the management responsibility of the customer, as the provider handles most of the management tasks, such as provisioning, scaling, patching, and updating the software. This allows the customer to focus on using the software to meet their business needs, rather than worrying about the underlying infrastructure.

Question: 390

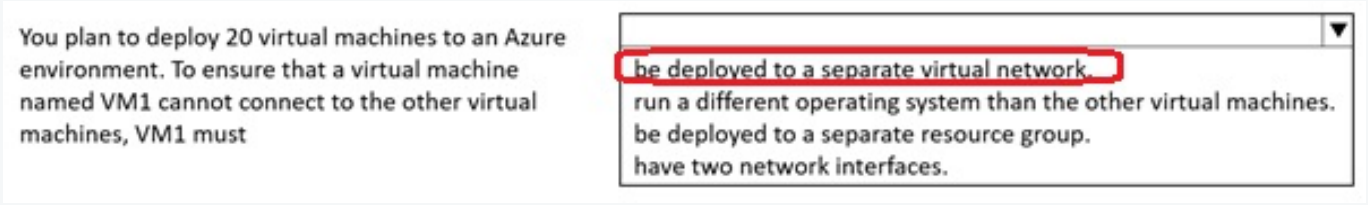
CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must

- be deployed to a separate virtual network.
- run a different operating system than the other virtual machines.
- be deployed to a separate resource group.
- have two network interfaces.

Answer:



Explanation:

You plan to deploy 20 virtual machines to an Azure environment. To ensure that a virtual machine named VM1 cannot connect to the other virtual machines, VM1 must be deployed to a separate virtual network.

Question: 391

CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

An organization that hosts its own infrastructure

- in a private cloud
- in a hybrid cloud
- in the public cloud
- on a Hyper-V host

no longer requires a data center.

Answer:

An organization that hosts its own infrastructure [▼] no longer requires a data center.

- in a private cloud
- in a hybrid cloud
- **in the public cloud**
- on a Hyper-V host

Explanation:

in the public cloud.

Question: 392 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

When a cloud app can allocate and release resources, it has [▼]

- **elasticity.**
- governance.
- high availability.
- predictability.
- reliability.

Answer:

Answer Area

When a cloud app can allocate and release resources, it has [▼]

- **elasticity.**
- governance.
- high availability.
- predictability.
- reliability.

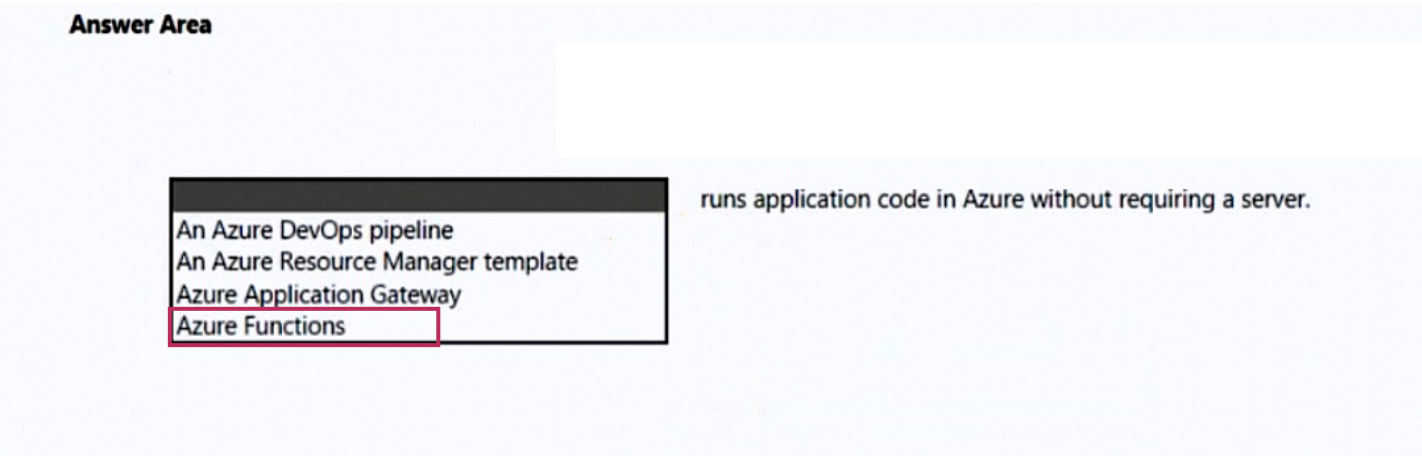
Explanation:

Elastic computing is the ability to quickly expand or decrease computer processing, memory, and storage resources to meet changing demands without worrying about capacity planning and engineering for peak usage. Typically controlled by system monitoring tools, elastic computing matches the amount of resources allocated to the amount of resources actually needed without disrupting operations. With cloud elasticity, a company avoids paying for unused capacity or idle resources and doesn't have to worry about investing in the purchase or maintenance of additional resources and equipment.

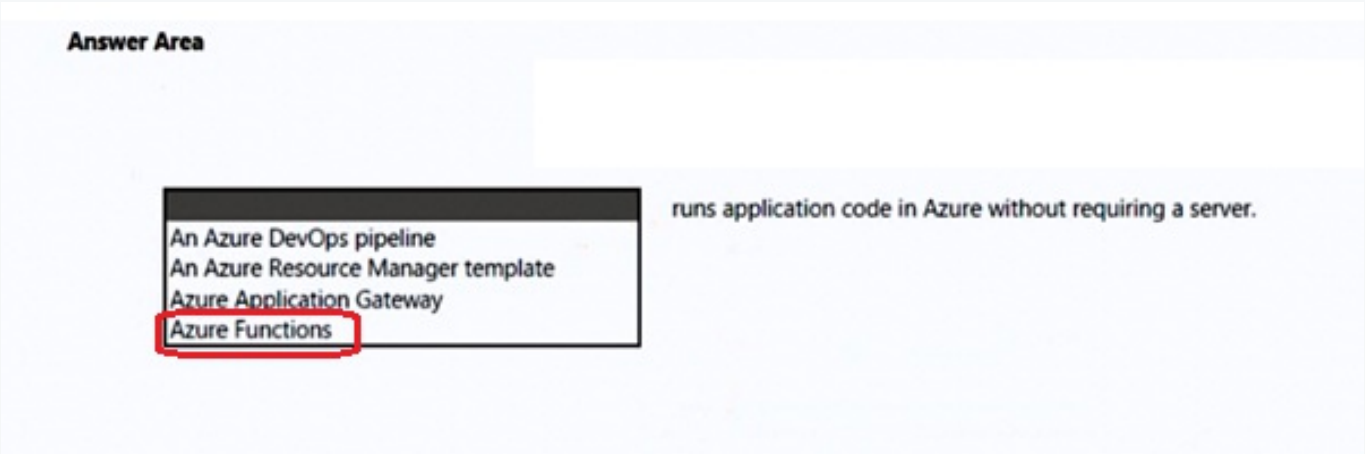
https://azure.microsoft.com/en-us/resources/cloud-computing-dictionary/what-is-elastic-computing/

Question: 393 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:



Explanation:

Azure Functions is a serverless solution that allows you to write less code, maintain less infrastructure, and save on costs.

Question: 394

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 1 (No): In a General Purpose v2 (GPv2) or Blob Storage account, the default account-level access tier can only be configured as Hot or Cool. The Archive tier can only be set at the individual blob level (or via Lifecycle Management rules targeting specific blobs); an entire storage account cannot have its default tier set to Archive.

Answer Area

Statement 2 (No): The Archive access tier offers the lowest storage capacity cost (cost per GB per month) in Azure Blob Storage. The Cool tier is cheaper than the Hot tier for storage, but it is substantially more expensive per gigabyte of capacity than Archive.

Statements	Yes	No
The Archive access tier for Azure Storage can be set at the account level.	○	○
The Cool access tier offers the lowest costs for storing blobs in Azure Storage.	○	○
After blobs are uploaded to an Azure Storage container, the access tier of the storage account can be changed.	○	○

Statement 3 (Yes): Changing the default access tier of an Azure Storage account (between Hot and Cool) is a metadata operation that can be executed at any time via the Azure portal, CLI, PowerShell, or ARM/Bicep, regardless of whether blobs already exist in its containers. Blobs that do not have an explicitly assigned blob-level tier will automatically inherit the newly selected account-level default tier.

Answer:

Answer Area

Statements	Yes	No
The Archive access tier for Azure Storage can be set at the account level.	○	○
The Cool access tier offers the lowest costs for storing blobs in Azure Storage.	○	○
After blobs are uploaded to an Azure Storage container, the access tier of the storage account can be changed.	○	○

Explanation:

No

No

Yes

The archive access tier for Azure Storage cannot be set at the account level. It can only be set at the blob level

Hot, cool, and archive tiers can be set at the blob level

The Archive Tier has the lowest storage cost of them all

Hot Tier: Storage Cost: Highest / Access Cost: Lowest

Cool Tier: Storage Cost: Medium / Access Cost: Medium

Archive Tier: Storage Cost: Lowest/ Access Cost: Highest

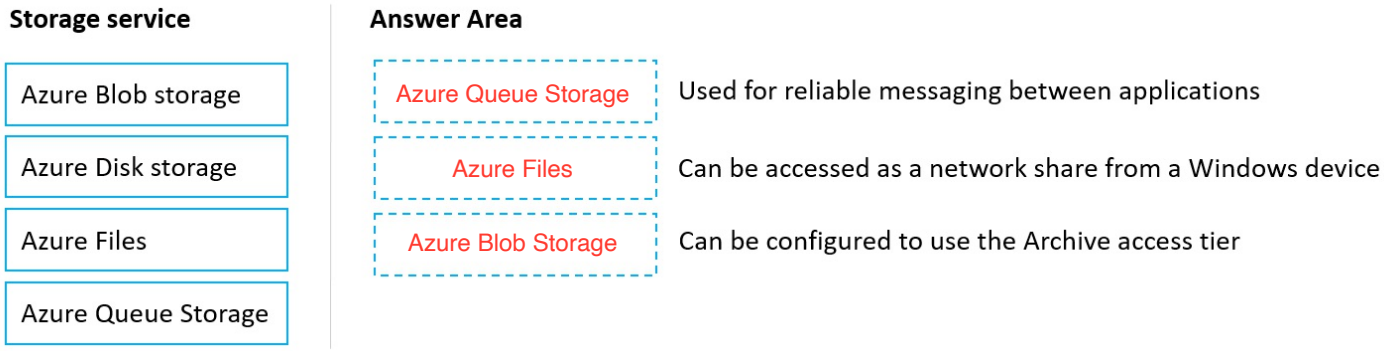
Reference:

https://learn.microsoft.com/en-us/azure/storage/blobs/access-tiers-overview

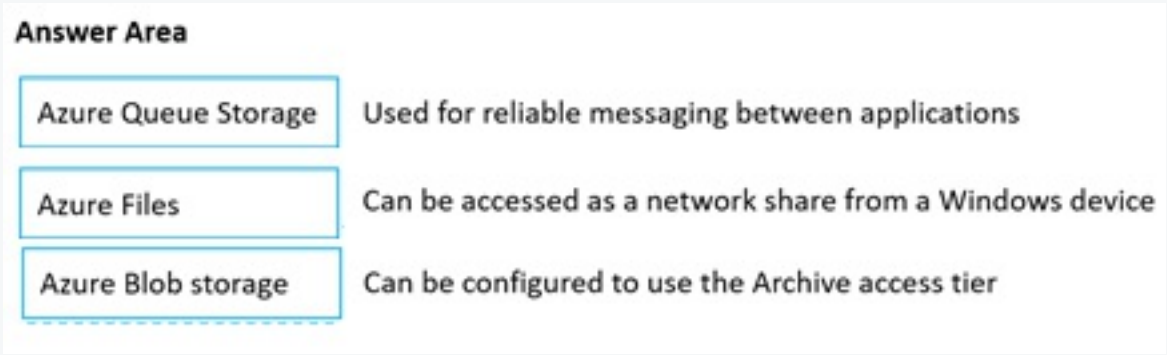
Question: 395

CertyIQ

DRAG DROP
-
Match the Azure storage services to the appropriate descriptions.
To answer, drag the appropriate storage service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:



Explanation:

Azure Queue storage is a fully managed, cloud-based message queue service.

Azure Queue Storage is a service for storing large numbers of messages. You access messages from anywhere in the world via authenticated calls using HTTP or HTTPS. A queue message can be up to 64 KB in size. A queue may contain millions of messages, up to the total capacity limit of a storage account. Queues are commonly used to create a backlog of work to process asynchronously

https://learn.microsoft.com/en-us/azure/storage/queues/storage-queues-introduction

Azure Files allows you to create file shares in the cloud that can be accessed by both Windows and Linux clients over the SMB (Server Message Block) protocol.

Question: 396

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 1 (Yes): Azure supports creating FileStorage accounts, which are Premium storage accounts backed by solid-state drives (SSDs) designed specifically for hosting enterprise, high-performance Azure file shares with low-latency SMB and NFS access.

Answer Area

Statement 2 (Yes): Azure supports BlockBlobStorage accounts, which are Premium tier storage accounts optimized for high transaction rates, low-latency I/O, and fast access patterns using SSD media specifically for block blobs and append blobs.

Statements	Yes	No
Premium storage accounts can be configured as Azure file shares.	○	○
Premium storage accounts can be configured as block blobs storage.	○	○
Premium storage accounts can be configured as StorageV2 storage.	○	○

Statement 3 (No): In the Azure Resource Manager storage architecture, General-purpose v2 (StorageV2) accounts are strictly standard-tier multi-service storage accounts (supporting Blobs, Files, Queues, and Tables together on magnetic/standard media). Premium performance is provisioned using specialized workload-specific account kinds (FileStorage, BlockBlobStorage, PageBlobStorage), not as a StorageV2 account type.

Answer:

Answer Area

Statements	Yes	No
Premium storage accounts can be configured as Azure file shares.	●	○
Premium storage accounts can be configured as block blobs storage.	●	○
Premium storage accounts can be configured as StorageV2 storage.	○	●

Explanation:

1: True.

Premium storage accounts provide high-performance storage for Azure virtual machines. Using premium storage accounts to create file shares can provide better performance and increased reliability compared to standard storage accounts.

2:True.

Block blobs are used to store unstructured data, such as text and images, and can be up to 4.75 TB in size. Using premium storage accounts for block blobs can provide better performance and increased reliability compared to standard storage accounts.

3: False.

Premium storage accounts cannot be configured as a storageV2 storage accounts. StorageV2 storage account is a new version of General purpose storage accounts, that provide all the features of the General purpose v1 and additional features and capabilities such as larger file shares, higher IOPS and throughput, and archive storage tier.

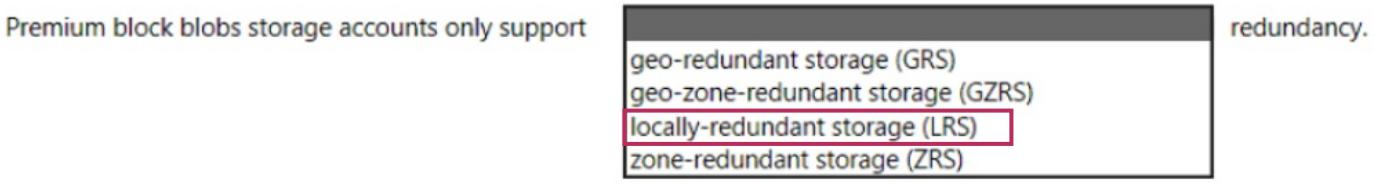
Question: 397

CertyIQ

HOTSPOT

-
Select the answer that correctly completes the sentence.

Answer Area

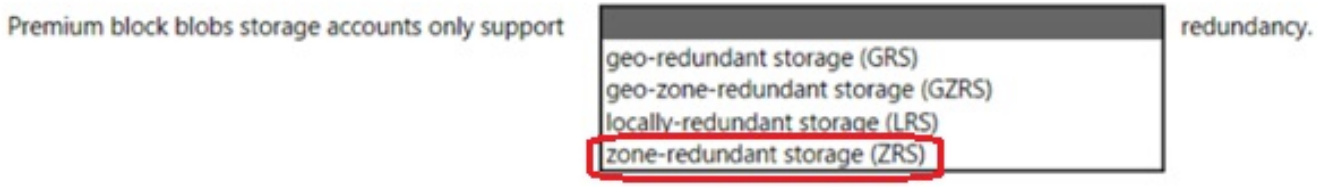


Answer:

Primary Region Redundancy Only: Premium Block Blob storage accounts (BlockBlobStorage) are built for low-latency, high-IOPS transactional workloads using solid-state drives (SSDs). Because synchronous or asynchronous replication across paired geographic regions would compromise ultra-low latency guarantees, geo-redundant options (GRS, GZRS, RA-GRS, RA-GZRS) are not supported.

Answer Area

Regional Availability vs. Universal Support: While Microsoft introduced support for Zone-redundant storage (ZRS) for Premium block blobs in select regions that possess Availability Zones, Locally-redundant storage (LRS) is the only redundancy model universally supported across all Azure regions for this account type.



Explanation:

Key word - 'redundancy', means it will have to be stored in more than one place. So answer is correct, ZRS.

Question: 398

CertyIQ

You have an Azure web app.
You need to manage the settings of the web app from an iPhone.
What are two Azure management tools that you can use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Windows PowerShell
B. Azure Cloud Shell
C. the Azure portal
D. Azure Storage Explorer

Answer: BC

Explanation:

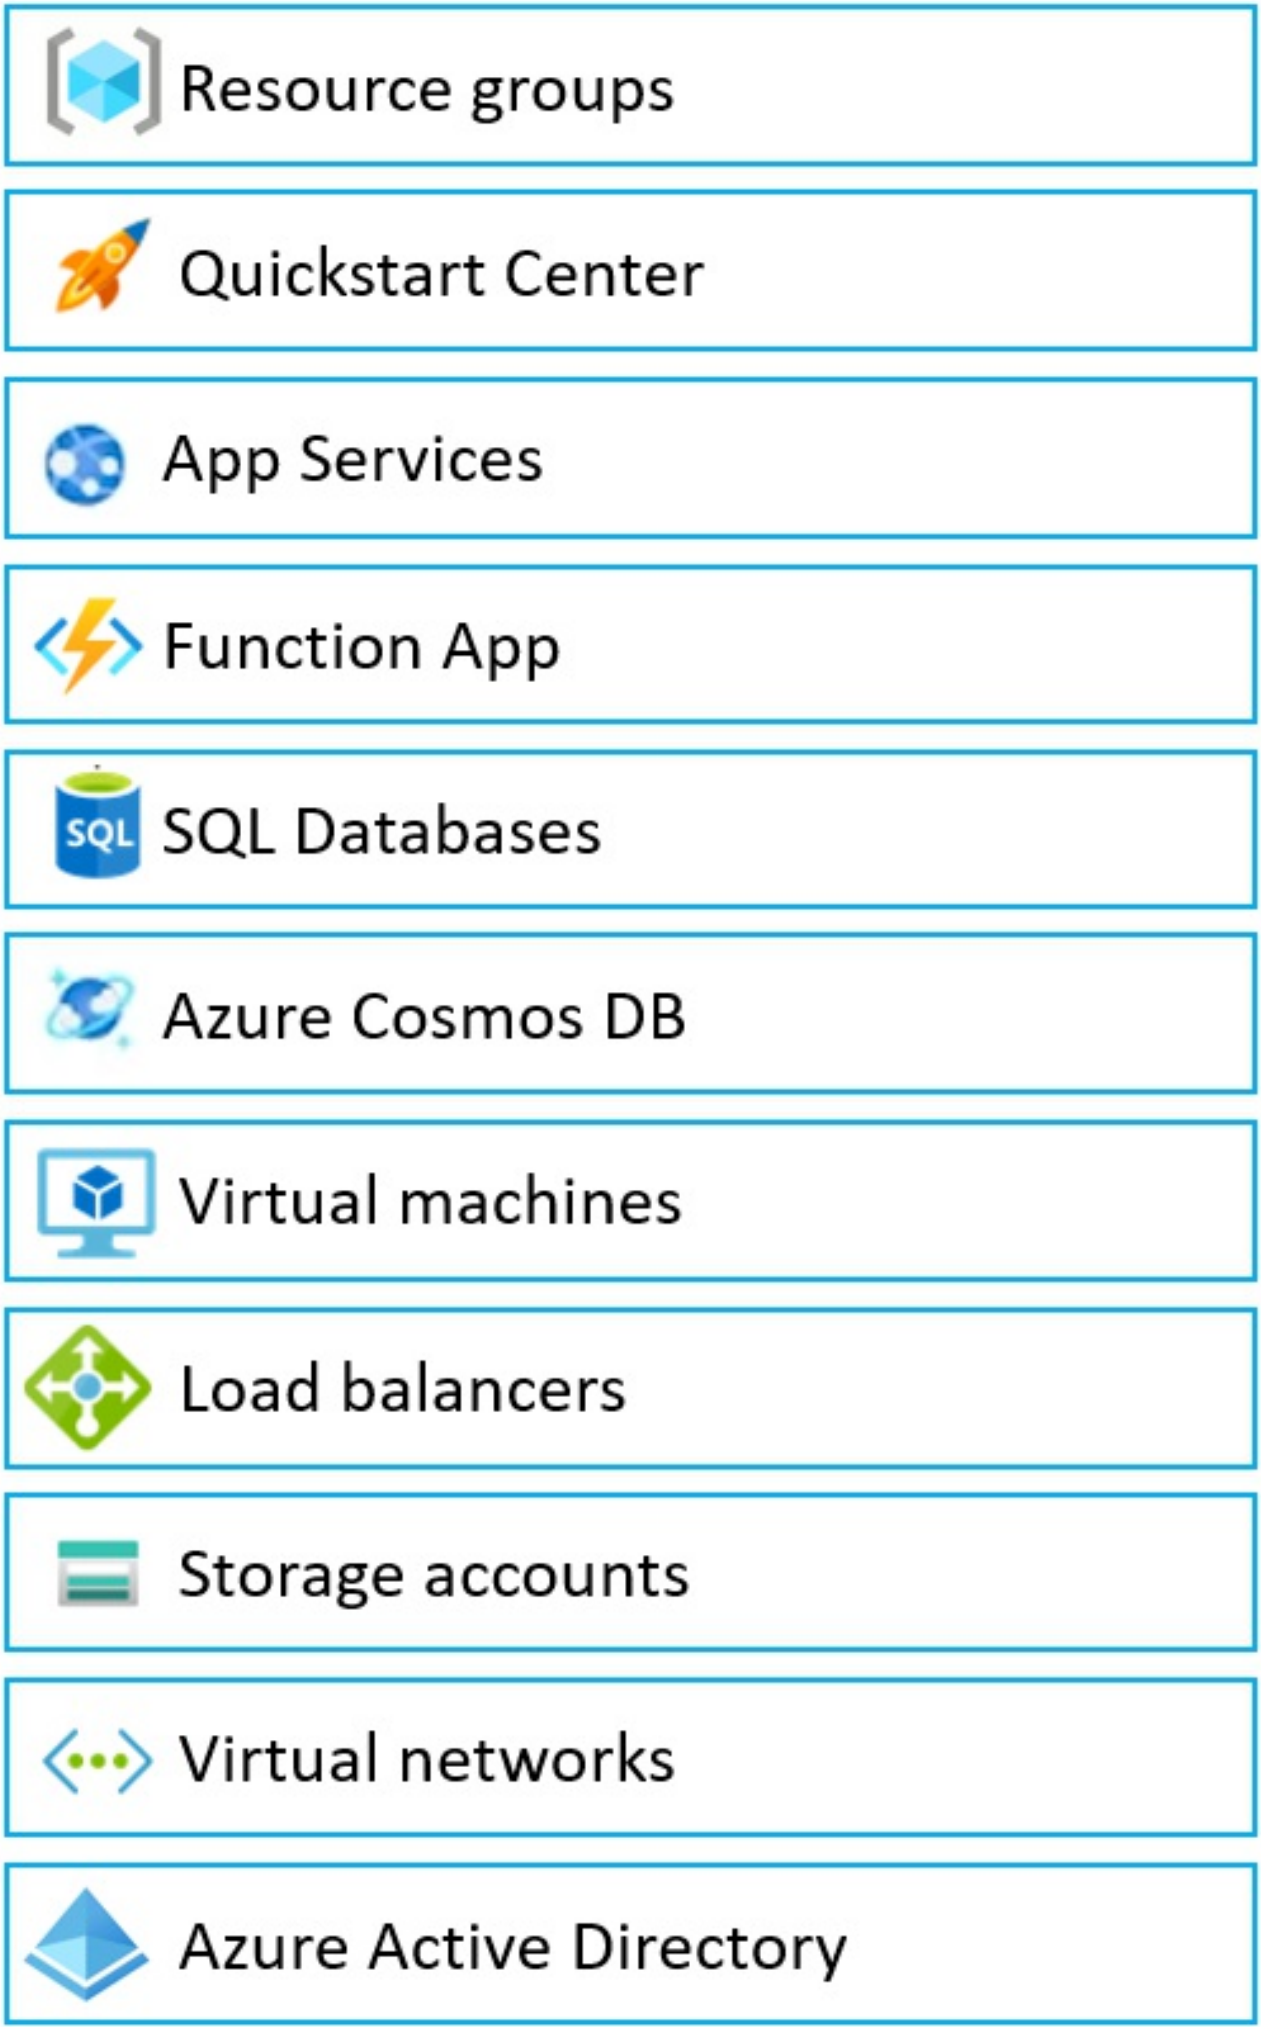
https://azure.microsoft.com/en-us/get-started/azure-portal/mobile-app

Question: 399

CertyIQ

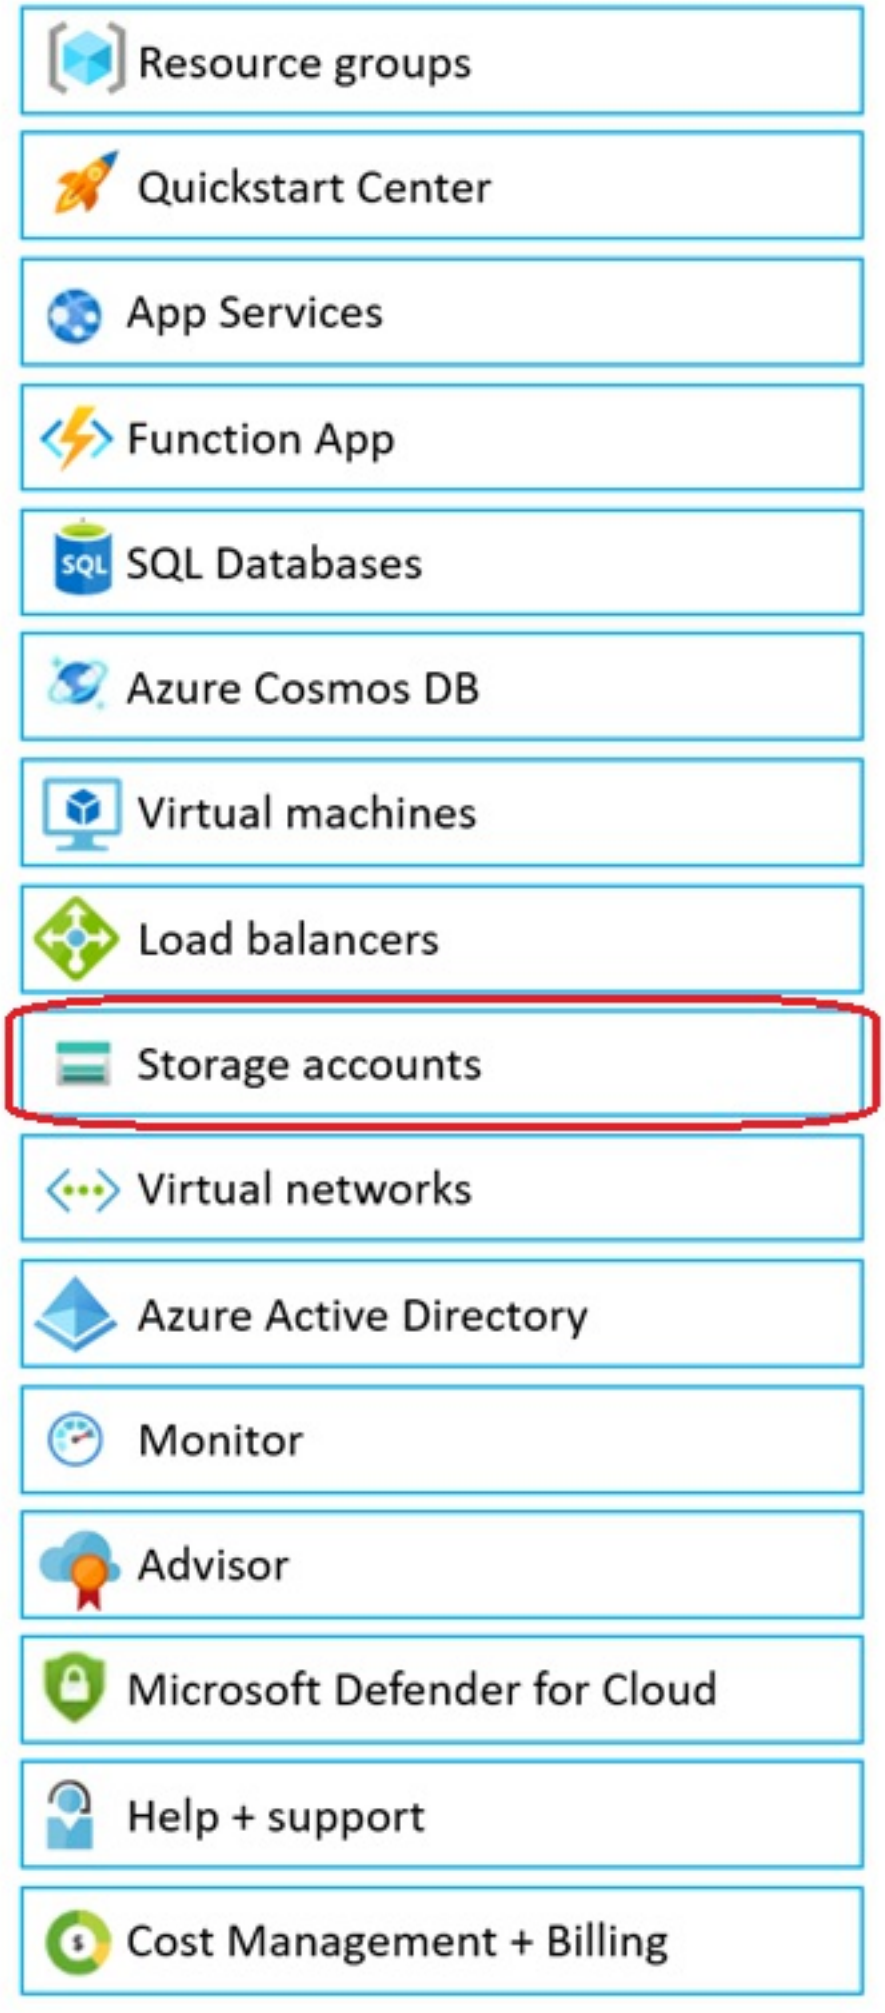
HOTSPOT
-
You need to create a new Azure file share.

What should you use? To answer, select the service in the answer area.
NOTE: Each correct selection is worth one point.



Monitor
Advisor
Microsoft Defender for Cloud
Help + support
Cost Management + Billing

Answer:



Resource groups
Quickstart Center
App Services
Function App
SQL Databases
Azure Cosmos DB
Virtual machines
Load balancers
Storage accounts
Virtual networks
Azure Active Directory
Monitor
Advisor
Microsoft Defender for Cloud
Help + support
Cost Management + Billing

Question: 400 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statement 2 (Yes): ARM templates implement Infrastructure as Code (IaC) using declarative JSON (or Bicep) syntax. They define the exact desired state of the target infrastructure and its configuration in code rather than requiring manual imperative provisioning

Statements	Yes	No
You can deploy Azure Resource Manager (ARM) templates by using the Azure portal.	○	○
Azure Resource Manager (ARM) templates can define infrastructure by using code.	○	○
Each Azure resource to be deployed requires a separate Azure Resource Manager (ARM) template.	○	○

Statement 3 (No): A single ARM template can define and orchestrate dozens or hundreds of different Azure resources together in a single resources array (e.g., deploying a virtual network, network security group, public IP address, network interface, and virtual machine all within one single template file).

Answer:

Answer Area

Statements	Yes	No
You can deploy Azure Resource Manager (ARM) templates by using the Azure portal.	○	○
Azure Resource Manager (ARM) templates can define infrastructure by using code.	○	○
Each Azure resource to be deployed requires a separate Azure Resource Manager (ARM) template.	○	○

Explanation:

YYN

it is not necessary to use a separate template for each resource. For example, an ARM template can define a virtual machine, a storage account, and a virtual network altogether in a single template.

Question: 401 CertyIQ

What should you use to prevent traffic from an Azure virtual network from being routed to an Azure Storage account via the internet?

A. a network security group (NSG)
B. a public endpoint
C. Azure VPN Gateway
D. a service endpoint

Virtual Network (VNet) Service Endpoints: By default, Azure Storage accounts expose public endpoints accessible over the internet. When a workload inside a virtual network communicates with a storage account's default public URL, traffic could exit through the internet path.

Enabling a Virtual Network Service Endpoint (specifically Microsoft.Storage) extends your virtual network's private address space and identity directly to the Azure Storage service.

Answer:

Traffic between the virtual network and the storage account is forced to travel exclusively over the Microsoft Azure backbone network, completely preventing traffic from traversing the public internet.

D

Explanation:

1. I'd go with D

2. A storage account is an Azure Resource Manager resource.

Question: 402 CertyIQ

Which service can replace a resource lock automatically if the lock is removed?

A. Azure Information Protection (AIP)
B. Azure Blueprints
C. Azure Backup
D. Azure Advisor

Azure Blueprints Resource Locks: Azure Blueprints allows cloud architects to define repeatable sets of Azure resources adhering to organizational standards and governance requirements.

When assigning a blueprint, you can configure Resource Locks (such as Do Not Delete or Read Only).

Answer: B

Explanation:

Azure Blueprints implements lock management through blueprint assignment tracking: if an administrator removes or tampers with a blueprint-assigned lock, the blueprint assignment state detects the drift and can enforce or reapply the locking state upon blueprint re-assignment and management enforcement.

It's typically possible for someone with appropriate Azure role-based access control (Azure RBAC) on the subscription, such as the 'Owner' role, to be allowed to alter or delete any resource. This access isn't the case when Azure Blueprints applies locking as part of a deployed assignment. If the assignment was set with the Read Only or Do Not Delete option, not even the subscription owner can perform the blocked action on the protected resource.

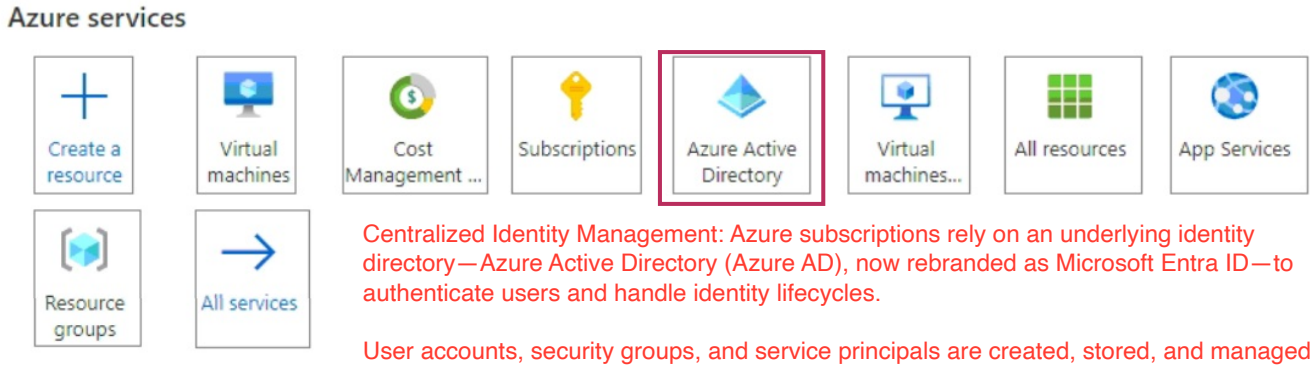
This security measure protects the consistency of the defined blueprint and the environment it was designed to create from accidental or programmatic deletion or alteration.

https://learn.microsoft.com/en-us/azure/governance/blueprints/concepts/resource-locking#overriding-locking-states

Question: 403 CertyIQ

HOTSPOT
-
You need to create a new user for an Azure subscription.
What should you use? To answer, select the service in the answer area.
NOTE: Each correct match is worth one point.

Answer Area

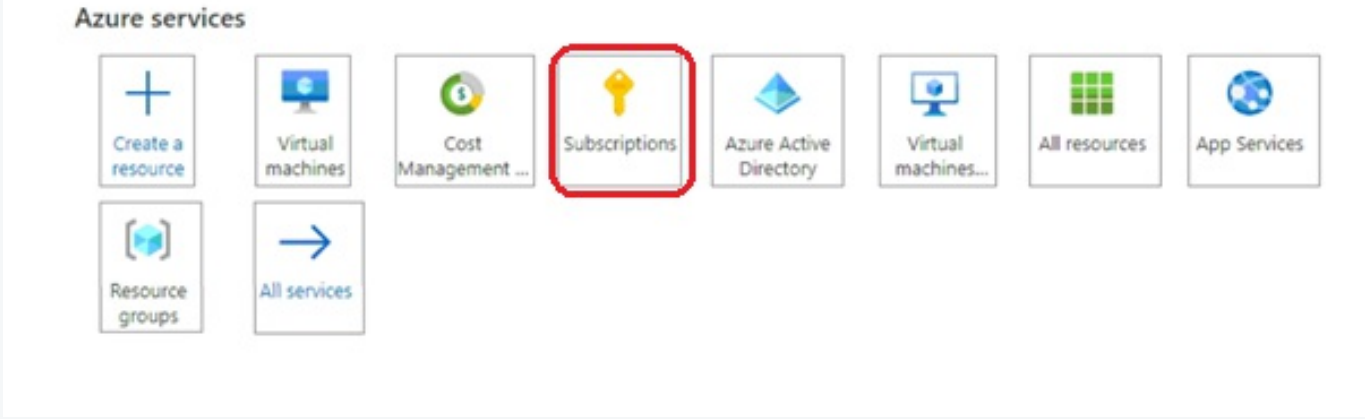


Centralized Identity Management: Azure subscriptions rely on an underlying identity directory—Azure Active Directory (Azure AD), now rebranded as Microsoft Entra ID—to authenticate users and handle identity lifecycles.

User accounts, security groups, and service principals are created, stored, and managed directly within the directory tenant under the Users blade in Azure AD / Entra ID. Once the user object exists in the directory, access permissions (RBAC roles) can then be assigned to that user at the subscription, resource group, or individual resource scope.

Answer:

Answer Area



Explanation:

The keyword is **subcription**

At the Azure portal, select Subscriptions. Select the subscription you want to assign and then select Access Control. Select Add to add a user to the subscription. After you add the user to the subscription, you can assign the user a role and the account to which the user will have access.

Question: 404

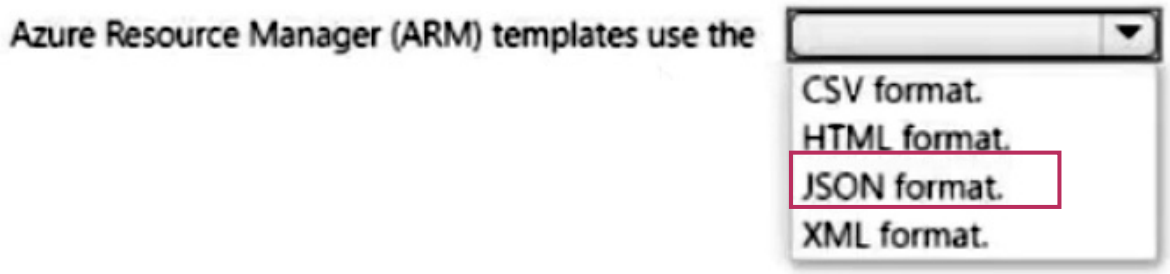
CertyIQ

HOTSPOT

-

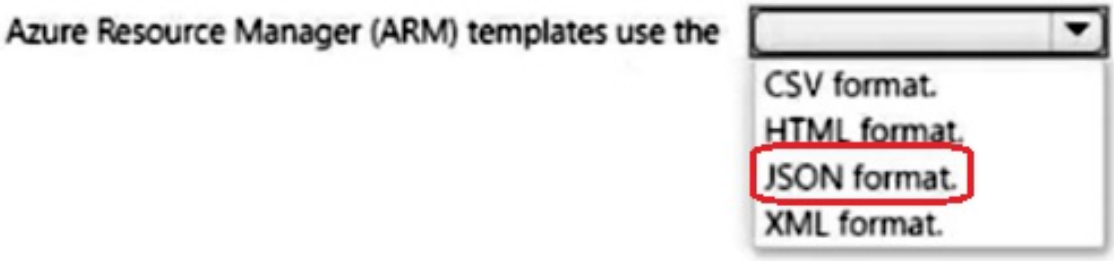
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

"JSON format" is the answer.

https://learn.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

To implement infrastructure as code for your Azure solutions, use Azure Resource Manager templates (ARM templates). The template is a JavaScript Object Notation (JSON) file that defines the infrastructure and configuration for your project. The template uses declarative syntax, which lets you state what you intend to deploy without having to write the sequence of programming commands to create it. In the template, you specify the resources to deploy and the properties for those resources.

Question: 405

CertyIQ

You plan to collect and analyze event details for five Azure virtual machines.
You need to run queries to compare the event details collected from all the virtual machines.
Which two tools should you use? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Azure Service Health
B. Azure Service Bus
C. Azure Monitor
D. Azure Advisor
E. Log Analytics

Azure Monitor (Collection Platform): Azure Monitor collects metrics and log data across cloud and on-premises environments. By deploying the Azure Monitor agent to the five virtual machines, it aggregates event logs (such as Windows Event Logs or Linux Syslog) into a central store.

Azure Log Analytics (Query & Analysis Tool): Log Analytics is the primary tool within the Azure portal used to edit, run, and evaluate Kusto Query Language (KQL) queries against the log data collected by Azure Monitor. It allows administrators to run unified queries across multiple resources, directly comparing event records across all five virtual machines.

Answer: CE

Explanation:

Log Analytics: Use this primary tool in the Azure portal to edit log queries and interactively analyze their results. Even if you intend to use a log query elsewhere in Azure Monitor, you'll typically write and test it in Log Analytics before you copy it to its final location.

https://learn.microsoft.com/en-us/azure/azure-monitor/logs/log-query-overview

Question: 406 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

An Azure SLA is a formal agreement between Microsoft and a customer that defines

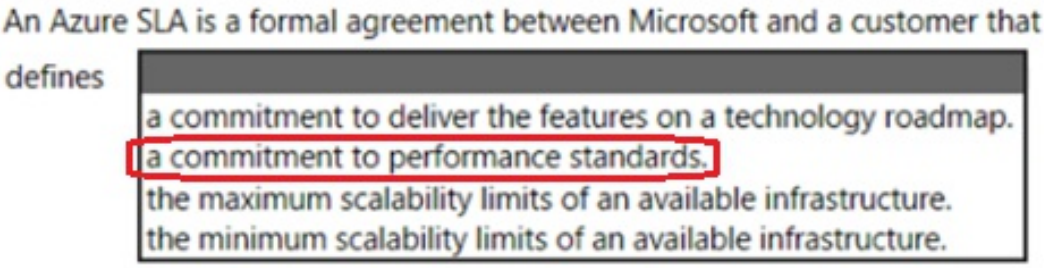
- a commitment to deliver the features on a technology roadmap.
- a commitment to performance standards.
- the maximum scalability limits of an available infrastructure.
- the minimum scalability limits of an available infrastructure.

An Azure SLA (Service Level Agreement) is Microsoft's formal commitment to specific performance and availability levels, such as 99.9% uptime for a service. If Microsoft misses the target, customers may be eligible for service credits.

The other options are wrong because:

Answer: An SLA doesn't promise features from a technology roadmap.
It doesn't define scalability limits, either maximum or minimum. Those are service limits and quotas, which are documented separately.

Answer Area



Explanation:

"a commitment to performance standards" is the the answer.

An Azure Service Level Agreement (SLA) is a formal agreement between Microsoft and a customer that defines the level of service and availability that Microsoft will provide for a specific Azure service.

The SLA typically includes metrics such as uptime, availability, and responsiveness, and specifies the guarantees that Microsoft will make in terms of meeting those metrics.

In more detail, an Azure SLA outlines the service level targets and credit system for Azure service, ensuring that customer will receive a credit towards their bill if they don't meet the agreed-upon service level. It guarantees a certain level of uptime (i.e. availability) for a given Azure service, and if that service falls below that level, customer may be eligible for a service credit to be applied to their account.

Question: 407 CertyIQ

What should you use to track the costs of Azure resources?

A. Azure Quickstart templates
B. tags
C. budgets
D. usage and quotas

Azure Budgets (Cost Tracking & Monitoring): In Microsoft Cost Management, Budgets are explicitly used to plan, track, and monitor cloud spending against allocated financial thresholds.

Budgets evaluate spending trends over a specific period (monthly, quarterly, or annually) and trigger automated alerts or action groups (such as shutting down test VMs) when thresholds are approached or exceeded, providing continuous cost tracking.

Microsoft Learn explicitly defines budgets as the mechanism to "compare and track spending as you analyze costs."

Answer: D

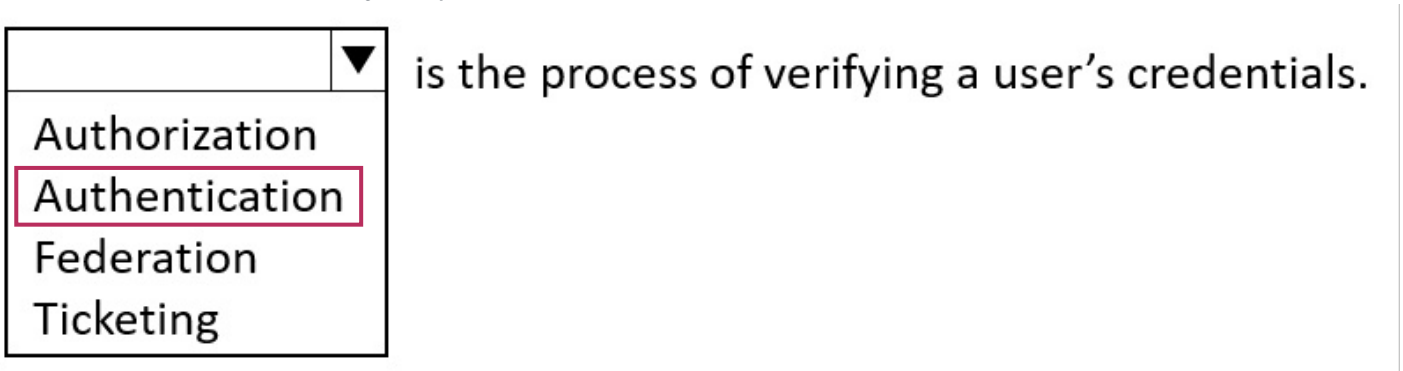
Explanation:

usage and quotas: Tracks the numerical quantity/consumption of resources against service limits (e.g., vCPU core limits per region), but does not relate capacity consumption to monetary dollar costs.

Usage and quotas allow you to monitor and control resource usage, and prevent unexpected charges. You can set quotas on resources to limit the amount of usage, and use Azure Monitor to track usage and performance metrics. This helps you identify inefficiencies and optimize your resource usage to save costs.Tags allow you to categorize Azure resources and add metadata to them, which makes it easier to track and manage costs. You can use tags to organize resources by department, project, environment, or any other category that makes sense for your organization. Once you have tagged your resources, you can use the Azure Cost Management and Billing tool to analyze costs by tag and get a better understanding of where your money is going.Budgets allow you to set spending limits and get alerts when you are approaching or exceeding those limits. You can set budgets at the subscription, resource group, or resource level, and receive email notifications when spending reaches a certain threshold. Budgets help you stay on top of costs and avoid unexpected charges.

Question: 408 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:

Explanation:

Authentication is the process of proving that you are who you say you are.

Authorization is the act of granting an authenticated party permission to do something.

https://learn.microsoft.com/en-us/azure/active-directory/develop/authentication-vs-authorization

Therefore answer should be Authentication

Question: 409

Operating Expenditure (OpEx) Model: Public cloud services, including Azure App Service, VMs, and cloud hosting, operate on a consumption/subscription-based billing model. Deploying and hosting resources incurs ongoing, recurring monthly usage charges based on provisioned capacity, runtime, and compute resources.

CertyIQ

HOTSPOT

-

Select the answer that correctly completes the sentence.

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure.
- reduce the number of connections to the website.

Inbound Data Transfers (Ingress): In Azure's bandwidth pricing architecture, data ingress (data transferred into an Azure datacenter) is free. You do not pay data transfer charges to migrate website files or database content into Azure.

Public Accessibility: Public-facing websites communicate directly over the public internet via HTTP/HTTPS; they do not mandate private site-to-site or point-to-site VPN infrastructure to serve incoming internet traffic.

Answer:

When planning to migrate a public website to Azure, you must plan to **pay monthly usage costs.**

Explanation:

B. pay monthly usage costs: Azure is a pay-as-you-go service, which means that you will be charged based on your usage. You must plan to pay monthly usage costs for the Azure services and resources you use to host your website.

Question: 410

CertyIQ

HOTSPOT

-

Select the answer that correctly completes the sentence.

- Resource groups
- Management groups
- Azure policies
- Azure App Service plans

provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

Answer:

- Resource groups
- Management groups
- Azure policies
- Azure App Service plans

provide organizations with the ability to manage the compliance of Azure resources across multiple subscriptions.

Explanation:

"Management Groups" is the answer.

https://learn.microsoft.com/en-us/azure/governance/management-groups/overview

If your organization has many Azure subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Management groups provide a governance scope above subscriptions. You organize subscriptions into management groups; the governance conditions you apply cascade by inheritance to all associated subscriptions.

Question: 411 CertyIQ

You plan to reduce ongoing Azure expenditures.
You need to identify which factors affect the costs of a resource.
Which three factors should you identify? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. the volume of outbound data
B. the volume of inbound data
C. the service tier
D. the Azure region
E. the type of processed data

Answer: ACD

Explanation:

A C D

There are several factors that can affect the costs of a resource in Azure. Here are three factors that you should consider when trying to identify which factors are affecting the costs of a resource:

The volume of outbound data: The volume of data that is transferred out of Azure can affect the costs of a resource. For example, if you have a resource that generates a large volume of outbound data, such as a web server that serves a lot of content to users, this can result in higher costs.

The service tier: The service tier that you choose for a resource can also affect its costs. For example, if you choose a higher service tier, such as a more powerful virtual machine, this can result in higher costs.

The Azure region: The Azure region in which a resource is deployed can also affect its costs. Azure regions are geographical areas that contain one or more data centers, and the costs of resources can vary depending on the region in which they are deployed.

Question: 412 CertyIQ

Your company has an Azure subscription that contains several resources.
You need to identify which department is responsible for the cost of each resource.
What should you use?

A. budgets
B. alerts
C. tags

Resource Tagging for Cost Attribution: Azure tags are metadata elements consisting of key-value pairs assigned directly to Azure resources, resource groups, or subscriptions.

When implementing a cloud financial management (FinOps) or chargeback/showback model, Microsoft Cost Management uses tags to group, filter, and allocate costs across different business units, departments, environments, or project codes.

Tagging resources with identifiers like Department: Marketing or Owner: JaneDoe allows billing administrators to pinpoint cost responsibility per resource on detailed usage invoices and Cost Analysis dashboards.

Answer: C

Explanation:

https://learn.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources?tabs=json#tags-and-billing

You can use tags to group your billing data. If you're running multiple VMs for different organizations, for example, use the tags to group usage by cost center. You can also use tags to categorize costs by runtime environment, such as the billing usage for VMs running in the production environment.

Question: 413 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer:

Explanation:

platform as a service (Paas)

Question: 414 CertyIQ

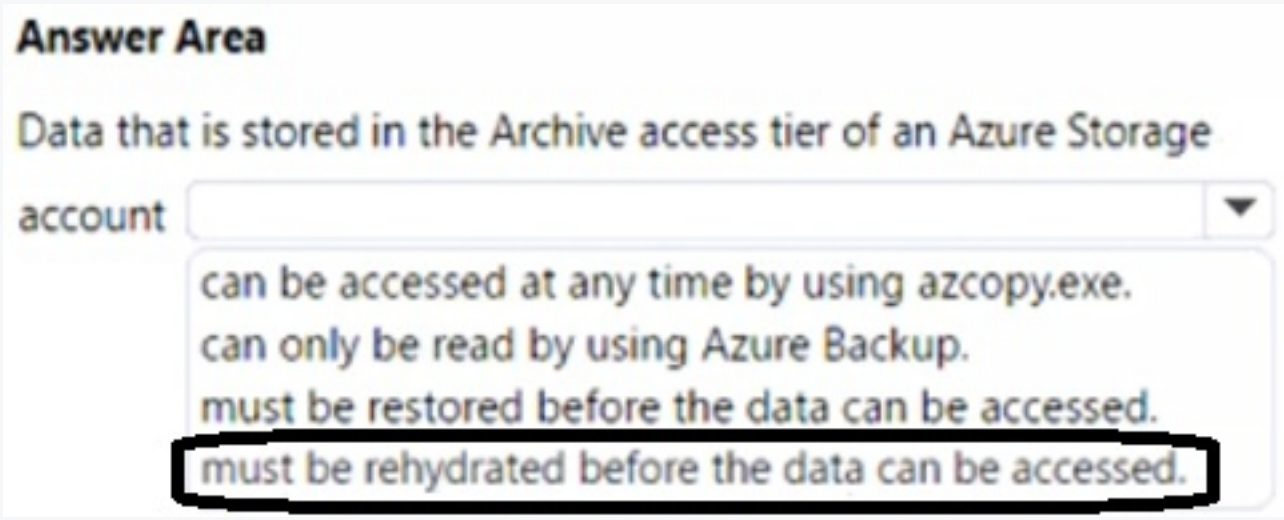
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

Data that is stored in the Archive access tier of an Azure Storage account

- can be accessed at any time by using azcopy.exe.
- can only be read by using Azure Backup.
- must be restored before the data can be accessed.
- must be rehydrated before the data can be accessed.

Answer:



Explanation:

Data that is stored in the Archive access tier of an Azure Storage account must be rehydrated before the data can be accessed.

Question: 415

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
An Azure Virtual Desktop session host can run Windows 10 or Windows 11 only.	○	○
An Azure Virtual Desktop host pool that includes 20 session hosts supports maximum of 20 simultaneous user connections.	○	○
Azure Virtual Desktop supports desktop and app virtualization.	○	○

Answer:

Answer Area

Statements	Yes	No
An Azure Virtual Desktop session host can run Windows 10 or Windows 11 only.	○	●
An Azure Virtual Desktop host pool that includes 20 session hosts supports maximum of 20 simultaneous user connections.	○	●
Azure Virtual Desktop supports desktop and app virtualization.	●	○

Explanation:

Statement 1: An Azure Virtual Desktop session host can run Windows 10 or Windows 11 only.

Answer: No

While Windows 10 and Windows 11 (including their specialized Multi-session editions) are incredibly popular deployment choices, Azure Virtual Desktop natively supports server-based operating systems as session hosts as well. Organizations frequently deploy AVD session hosts running Windows Server 2022, Windows Server 2019, or Windows Server 2016 to run legacy enterprise software or specialized line-of-business applications.

Statement 2: An Azure Virtual Desktop host pool that includes 20 session hosts supports maximum of 20 simultaneous user connections.

Answer: No

This statement describes a strict 1:1 personal desktop assignment model, but AVD is highly utilized for its pooled host pools running Windows Client Multi-session or Windows Server. With multi-session configurations, a single session host virtual machine can support multiple independent user sessions concurrently. If you have 20 session hosts running multi-session configurations with a capacity limit set to 10 users per host, that single host pool could easily support up to 200 simultaneous user connections.

Statement 3: Azure Virtual Desktop supports desktop and app virtualization.

Answer: Yes

AVD allows administrators to provision two distinct types of application groups to meet user needs:

Desktop Virtualization (Full Desktop): Users log in and are presented with a complete, immersive virtualized desktop environment where they can access the full OS GUI.

App Virtualization (RemoteApp): Instead of provisioning an entire desktop workspace, you can publish individual, isolated applications (like Microsoft Excel or a custom legacy ERP tool). To the end user, these apps launch and run seamlessly in their own individual windows on their local machine, behaving exactly like a locally installed application.

Question: 416 CertyIQ

HOTSPOT

-

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
In an Azure virtual machine scale set, the virtual machines are configured identically.	○	○
The number of Azure virtual machines in a virtual machine scale set can increase automatically.	○	○
The number of Azure virtual machines in a virtual machine scale set can decrease automatically.	○	○

Answer:

Answer Area

Statements	Yes	No
In an Azure virtual machine scale set, the virtual machines are configured identically.	●	○
The number of Azure virtual machines in a virtual machine scale set can increase automatically.	●	○
The number of Azure virtual machines in a virtual machine scale set can decrease automatically.	●	○

Explanation:

Statement 1: In an Azure virtual machine scale set, the virtual machines are configured identically.

Answer: Yes

An Azure Virtual Machine Scale Set is designed to deploy and manage a fleet of load-balanced virtual machines. To enable seamless scaling, all VM instances in the scale set are built from the exact same underlying base configuration. They share the identical operating system image, size SKU, storage disks, extension configurations, and network settings defined in the scale set's core configuration template.

Statement 2: The number of Azure virtual machines in a virtual machine scale set can increase automatically.

Answer: Yes

This is the core functionality of autoscale (scale-out). You can define autoscale rules based on performance metrics (such as average CPU utilization exceeding 75%, memory pressure, or network queue depth) or based on a specific calendar schedule. When these target thresholds are breached, the scale set automatically provisions and configures new identical VM instances to handle the increased workload.

Statement 3: The number of Azure virtual machines in a virtual machine scale set can decrease automatically.

Answer: Yes

This represents the complementary scale-in capability designed to optimize cloud spend. Just as a scale set can grow, you can configure corresponding autoscale rules to automatically deprovision and remove extra VM instances when application demand drops (for example, if average CPU utilization falls below 25%). This ensures you only pay for the compute resources you actively need.

Question: 417 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

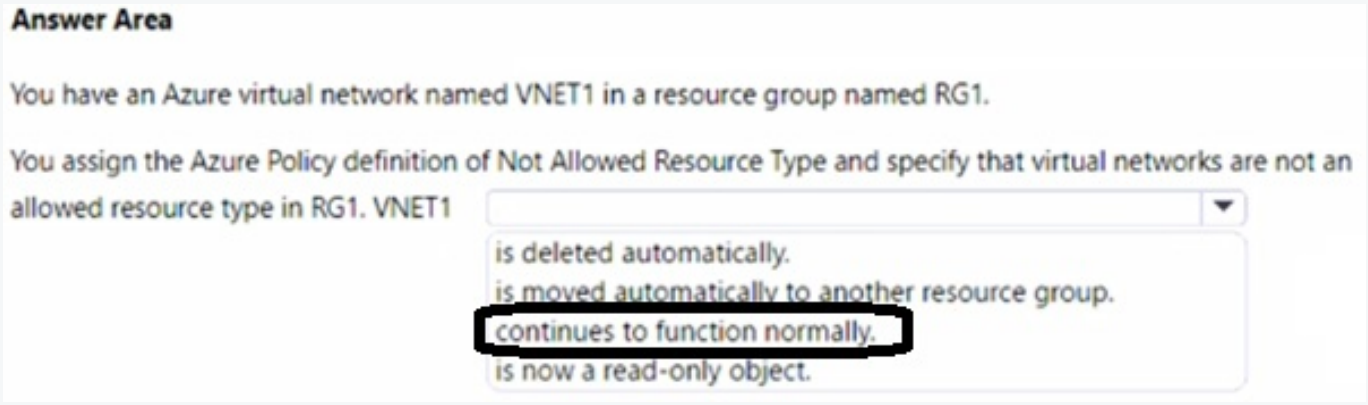
Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1 [ ]

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Answer:



Explanation:

You have an Azure virtual network named VNET1 in a resource group named RG1. You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1 continues to function normally.

Question: 418 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 1 (Yes): Microsoft explicitly defines Azure Advisor as a personalized cloud consultant that analyzes your specific resource configurations and usage telemetry to deliver tailored, actionable recommendations aligned with the Microsoft Azure Well-Architected Framework.

Answer Area

Statement 2 (Yes): Under its Cost recommendation pillar, Azure Advisor monitors virtual machine CPU, memory, and network utilization over time to identify idle, underutilized, or oversized VMs, proactively recommending resizing (downsizing) or shutting them down to cut spend.

Statements	Yes	No
Azure Advisor provides personalized recommendations.	○	○
Azure Advisor can provide cost recommendations for virtual machines.	○	○
Azure Advisor can provide recommendations across multiple Azure subscriptions.	○	○

Answer:

Statement 3 (Yes): Azure Advisor allows administrators to filter and view recommendations across individual resource groups, a single subscription, or multiple subscriptions simultaneously (including scoping across an entire Management Group hierarchy).

Answer Area

Statements	Yes	No
Azure Advisor provides personalized recommendations.	○	○
Azure Advisor can provide cost recommendations for virtual machines.	○	○
Azure Advisor can provide recommendations across multiple Azure subscriptions.	○	○

Explanation:

Statement 1: Microsoft Entra ID requires user passwords to be at least eight characters long.

Answer: Yes

By default, Microsoft Entra ID enforces a strict built-in password policy for cloud users. This policy mandates that passwords must have a minimum length of 8 characters and a maximum of 256 characters. It also requires a mix of character complexities (uppercase, lowercase, numbers, and symbols).

Statement 2: Passwords for cloud-only user accounts in Microsoft Entra ID never expire by default.

Answer: Yes

Historically, corporate IT forced users to change passwords every 30 to 90 days. Modern Microsoft security research shows that regular forced password rotation actually causes users to pick weaker, predictable variations of their old passwords. Therefore, for cloud-only accounts, the default setting is PasswordNeverExpires. Global Administrators can override this, but out-of-the-box, they do not expire.

Statement 3: You can change the default lockout threshold for Microsoft Entra ID.

Answer: Yes

Microsoft Entra ID uses a security feature called Smart Lockout to lock out bad actors attempting to guess passwords via brute-force or dictionary attacks. By default, it locks an account after 10 failed attempts for a duration of 60 seconds. Administrators can customize these values by navigating to the Authentication methods -> Password protection pane to change the lockout threshold and duration to fit company security requirements.

Question: 419 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statement 1 (Yes): Azure Policy assignments support assignment scopes at the Management Group, Subscription, Resource Group, and individual Resource levels (including an individual virtual machine via its Resource ID scope).

Statements	Yes	No
You can assign an Azure policy to a virtual machine.	○	○
If an Azure policy is assigned to a resource group, noncompliant resources are removed from the group.	○	○
If an Azure policy is assigned to a resource group, only compliant resources can be deployed to the group.	○	○

Answer: Statement 2 (No): Azure Policy evaluates resource compliance; it does not delete or remove existing noncompliant resources from a resource group. Existing resources that do not adhere to a newly assigned policy are simply marked as noncompliant in the compliance dashboard.

Answer Area

Statement 3 (No): The behavior during deployment depends entirely on the policy definition's configured effect. While a policy with a Deny effect prevents noncompliant deployments, a policy configured with an Audit, AuditIfNotExists, or Append effect allows noncompliant resources to be deployed without interruption while flagging them for review. Therefore, assigning a policy does not guarantee that only compliant resources can be deployed.

Statements	Yes	No
You can assign an Azure policy to a virtual machine.	○	○
If an Azure policy is assigned to a resource group, noncompliant resources are removed from the group.	○	○
If an Azure policy is assigned to a resource group, only compliant resources can be deployed to the group.	○	○

Explanation:

Statement 1: You can assign an Azure policy to a virtual machine.

Answer: Yes (Correct in the image)

Azure Policy assignments can be scoped to different levels of your cloud hierarchy. While they are frequently applied at the Management Group, Subscription, or Resource Group level, you can target an individual resource directly. Alternatively, policies utilizing guest configurations can evaluate and enforce compliance settings directly inside a single specific virtual machine.

Statement 2: If an Azure policy is assigned to a resource group, noncompliant resources are removed from the

group.

Answer: No (Correct in the image)

Azure Policy is an evaluation and governance system, not an automated deletion service. If an existing resource inside a resource group breaks a newly assigned policy rule, its status is flagged as Non-compliant in the Azure portal for visibility. It is never automatically deleted or removed from the resource group by the policy evaluation engine.

Statement 3: If an Azure policy is assigned to a resource group, only compliant resources can be deployed to the group.

Answer: Yes (Correct in the image based on specific conditions)

Explanation: This depends entirely on the Effect defined inside the policy rule:

If the policy uses a Deny effect, Azure Resource Manager (ARM) will block the deployment of any new non-compliant resource entirely. In this scenario, the statement is completely true.

Note on nuance: If the policy uses other effects like Audit, Append, or Modify, a non-compliant resource can still be deployed (and will simply be flagged as non-compliant or altered during deployment). However, for standard exam scenarios testing the restrictive enforcement of policies, this statement is marked as Yes to reflect the preventative capabilities of a Deny policy assignment.

Question: 420 CertyIQ

You have on-premises servers that run Windows Server.
What should you implement to manage the servers by using the Azure portal?

A.Azure Kubernetes Service (AKS)
B.Azure Arc
C.Docker
D.role-based access control (RBAC)

Answer: B

Explanation:

Answer: B Azure Arc

Azure Arc allows us to extend Azure management and governance capabilities to your on-premises and multi-cloud environments. By implementing Azure Arc, we can connect your Windows Server machines to Azure and manage them centrally through the Azure portal, alongside your other Azure resources.

Question: 421 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

You can use [ ] in Azure to send email alerts when the cost of the current billing period for an Azure subscription exceeds a specified limit.

- Advisor recommendations
- Access control (IAM)
- Budget alerts
- Compliance

Answer:

Answer Area

You can use [ ] in Azure to send email alerts when the cost of the current billing period for an Azure subscription exceeds a specified limit.

- Advisor recommendations
- Access control (IAM)
- Budget alerts
- Compliance

Explanation:

Budget alerts are a native governance feature within the Azure Cost Management + Billing suite designed to prevent unexpected overages and cloud spend leakage.

Question: 422 CertyIQ

HOTSPOT

-

Select the answer that correctly completes the sentence.

Answer Area

If Windows Server or Microsoft SQL Server licenses are covered by [ ], you can repurpose the licenses on Azure virtual machines.

- an End User License Agreement (EULA)
- Microsoft Lifecycle Policy
- Software Assurance

Azure Hybrid Benefit (AHB): Azure Hybrid Benefit is a licensing offer that allows customers to significantly reduce the cost of running workloads in the cloud.

Answer:

It enables organizations to repurpose their existing on-premises Windows Server and SQL Server licenses that have active Software Assurance (SA) (or qualifying cloud subscription licenses) to pay only the base compute rate (Linux rate) on Azure Virtual Machines, Azure SQL Database, and Azure SQL Managed Instance, effectively eliminating the cost of the OS/software licensing component.

Answer Area

If Windows Server or Microsoft SQL Server licenses are covered by [ ], you can repurpose the licenses on Azure virtual machines.

- an End User License Agreement (EULA)
- Microsoft Lifecycle Policy
- Software Assurance

Explanation:

Software assurance is a correct answer.

Question: 423 CertyIQ

You have a web app that runs in Azure.
You need to identify the amount of time it takes for web pages to load in a user's browser.
What should you use?

A.Azure Monitor alerts
B.Application Insights in Azure Monitor
C.Log Analytics
D.Azure Network Watcher

Application Performance Management (APM): Application Insights is an extension/ feature of Azure Monitor designed to monitor live web applications.

By adding a small JavaScript instrumentation SDK snippet to your web pages, Application Insights tracks client-side performance directly from end-user browsers. This includes page load performance, page view durations, network request timing, browser exceptions, and AJAX calls, allowing you to see exactly how long web pages take to load in end users' browsers.

C. Log Analytics: The general querying and workspace tool used to analyze log datasets collected by Azure Monitor; while client telemetry eventually lands in Log Analytics tables, the tool/feature responsible for capturing and measuring end-user browser page load times is Application Insights.

Answer: B

Explanation:

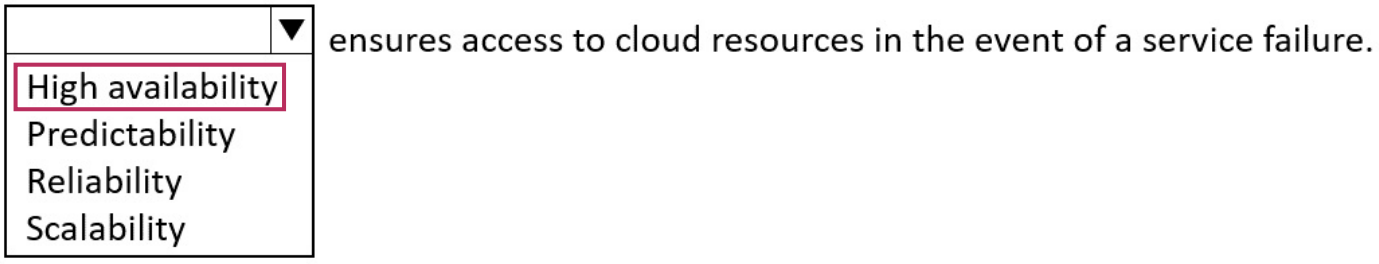
D. Azure Network Watcher: A regional network monitoring, diagnostic, and metrics tool used for IaaS virtual network infrastructure (packet capture, IP flow verify, next hop, connection troubleshoot); it has no visibility into web application browser rendering times or client HTTP performance.

It's B: Azure Application Insights is a feature of Azure Monitor that allows to monitor running applications, automatically detect performance anomalies, and use built-in analytics tools to see what users do on an app.

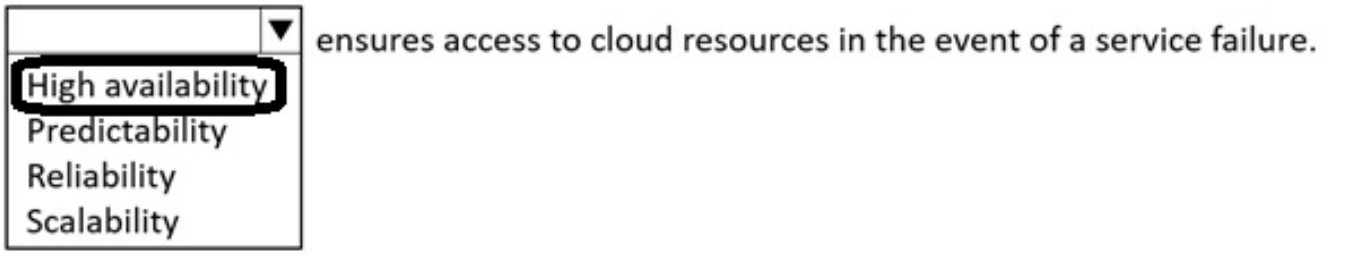
Question: 424

CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:



Explanation:

High availability ensures access to cloud resources in the event of a service failure.

High Availability (HA): This concept refers to a system's ability to remain continuously operational and accessible, even if an underlying component or localized service experiences a failure. In the cloud, this is achieved through built-in redundancies, such as deploying applications across multiple Availability Zones (AZs) with automated load balancing. If a hardware rack or an entire data center goes down, traffic is automatically rerouted to a healthy instance, ensuring zero or near-zero downtime for users.

Question: 425

CertyIQ

What should a desktop application use to interact with Azure and manage resources?

A.APIs

B.Azure Resource Manager (ARM) templates

C.Azure Command-Line Interface (CLI)

D.Azure Cloud Shell

Azure Resource Manager (ARM) REST APIs & SDKs: Azure Resource Manager provides a centralized management layer that handles all requests to create, configure, update, or delete Azure resources.

Every administrative tool (Azure portal, Azure PowerShell, Azure CLI, and custom software) fundamentally communicates with Azure by sending HTTP requests to the Azure Resource Manager REST APIs.

For custom software such as desktop applications, background services, or mobile applications, programmatic resource provisioning and management is performed directly using APIs or the official Azure SDKs built on top of those REST endpoints.

Answer: A

Explanation:

'A. APIs' is correct.Key is Desktop Applications which need to interact with Azure resources in a programmatical way, so APIs.

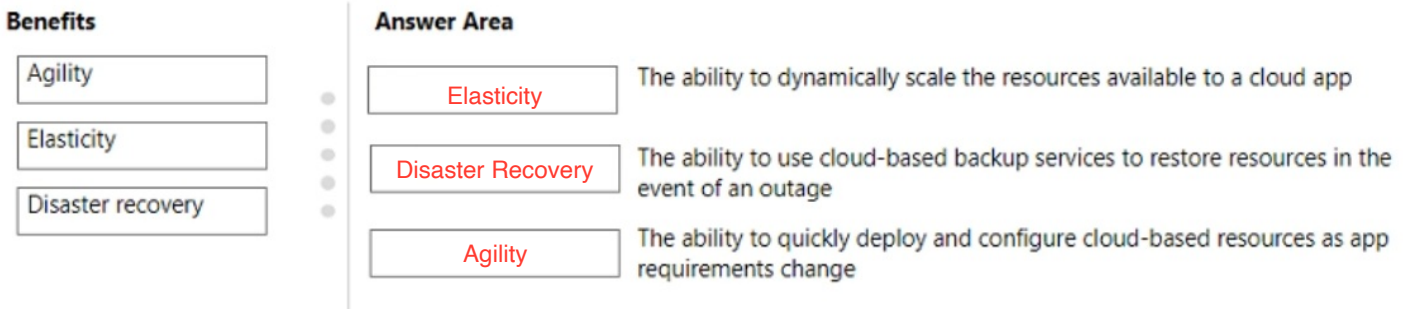
Question: 426

CertyIQ

DRAG DROP

-

Match the cloud computing benefits to the appropriate requirements.
To answer, drag the appropriate benefit from the column on the left to its requirement on the right. Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Explanation:

Elasticity $\rightarrow$ The ability to dynamically scale the resources available to a cloud appExplanation: Elasticity is the power of a system to automatically commission and decommission resources (like RAM, CPU, or virtual machines) on the fly to match current demand closely.

Disaster recovery $\rightarrow$ The ability to use cloud-based backup services to restore resources in the event of an outageExplanation: Disaster Recovery (DR) is a strategy focused on keeping applications

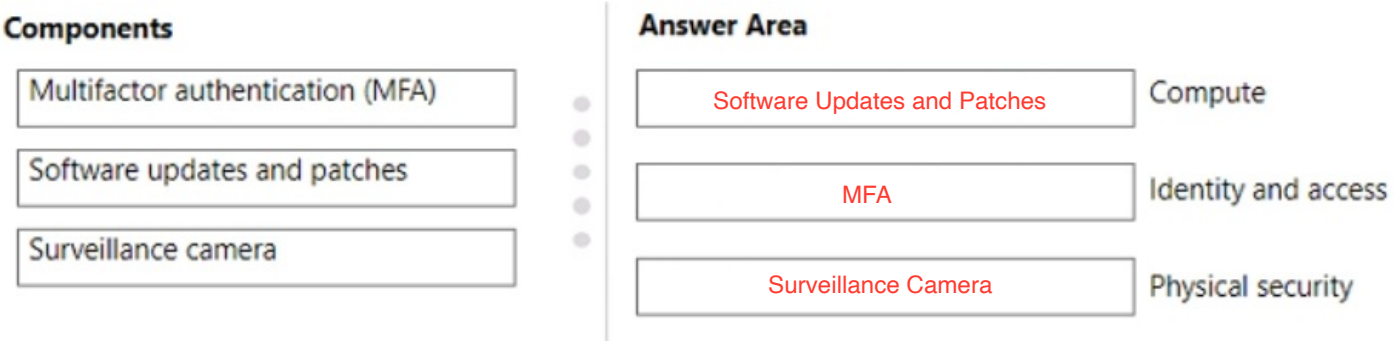
functional or rapidly restoring them following a catastrophic failure, network outage, or natural disaster.Key Context: DR relies heavily on data replication, backups, and cross-region failovers. If an entire data center goes dark due to a power grid failure, cloud-based disaster recovery ensures you can bring your applications back online using data mirrored in a separate, unaffected geographical region.

Agility $\rightarrow$ The ability to quickly deploy and configure cloud-based resources as app requirements changeExplanation: Agility is all about speed and flexibility from a business and development standpoint. It represents how rapidly an organization can respond to changes or test new ideas.Key Context: In a traditional on-premises data center, provisioning a new server could take weeks or months due to budgeting, hardware procurement, and physical installation. In the cloud, developers can deploy, configure, and teardown complex architectures in minutes using the portal, CLI, or infrastructure-as-code templates, allowing teams to innovate at an incredibly fast pace.

Question: 427

CertyIQ

DRAG DROP
-
Match the security components to the appropriate defense in depth layers.
To answer, drag the appropriate security component from the column on the left to its defense in depth layer on the right Each security component may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Explanation:

1. Software updates and patches $\rightarrow$ ComputeThe Layer: The Compute layer focus is entirely on securing the actual processing resources, such as virtual machines, container instances, or serverless functions running your applications.Why it matches: Unpatched operating systems and runtimes contain known vulnerabilities that attackers can exploit to gain control or execute arbitrary code. Applying software updates and security patches hardens the compute environments directly, minimizing the attack surface of those individual virtual machines or host environments.

2. Multifactor authentication (MFA) $\rightarrow$ Identity and accessThe Layer: The Identity and access layer controls access to infrastructure, applications, and data. It ensures that only authenticated and authorized

users (or services) can interact with resources.Why it matches: Identity has become the primary security perimeter in cloud environments. MFA requires users to provide multiple forms of verification before gaining access, directly strengthening this layer against compromised passwords, credential stuffing, and phishing attacks.

3. Surveillance camera $\rightarrow$ Physical securityThe Layer: The Physical security layer is the outermost barrier of defense-in-depth. It involves protecting the physical assets — such as data center buildings, server racks, and network cabling — from unauthorized physical access, theft, or damage.Why it matches: A surveillance camera acts as both a physical deterrent and a monitoring mechanism to protect the tangible facility itself. If an attacker cannot physically enter the data center, they cannot physically tamper with the disks or hardware.

Question: 428

CertyIQ

HOTSPOT
-

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 1 (Yes): Standard storage accounts (General-purpose v2 / StorageV2 and Blob Storage) support online access tiers, specifically Hot, Cool, and Cold (alongside offline Archive), with Hot optimized for frequently accessed blob data.

Answer Area

Statements	Yes	No
The Hot access tier is available for blob data that uses standard storage.	○	○
The Cool access tier is available for file shares in premium storage.	○	○
The Cool access tier can be configured at the storage account level.	○	○

Statement 2 (No): Premium storage accounts for file shares (FileStorage) utilize high-performance solid-state drives (SSDs) and are provisioned strictly as Premium tier (with provisioned IOPS/throughput). Access tiers like Hot, Cool, and Transaction Optimized are exclusive to Standard file shares, not premium storage.

Statement 3 (Yes): General-purpose v2 storage accounts allow setting the default access tier to either Hot or Cool (and in newer portal releases, Cold) directly at the storage account level. Any blob uploaded without an explicit individual tier inherits this default account-level setting.

Answer:

Answer Area

Statements	Yes	No
The Hot access tier is available for blob data that uses standard storage.	●	○
The Cool access tier is available for file shares in premium storage.	○	●
The Cool access tier can be configured at the storage account level.	●	○

Explanation:

Answer: Yes
Standard storage accounts support different online access tiers tailored to data usage patterns. The **Hot access tier** is optimized for storing data that is accessed or modified frequently. It features higher storage costs but the lowest data access/transaction costs among standard online tiers.

Answer: No
Premium storage accounts use Solid-State Drives (SSDs) designed for high performance, low-latency workloads and do not utilize standard blob-style online tiers like Cool or Archive. For file services, **Premium Azure File Shares** are provisioned at a specific high-performance tier with fixed limits. The Cool (and Hot)

tiers for file shares are exclusively features of standard performance storage accounts.

Answer: Yes
When you create or modify a General Purpose v2 (GPv2) or Blob Storage account, you can set a default **Access Tier** (Hot or Cool) at the root level of the entire storage account. Any new blob uploaded to that account will automatically inherit that tier unless you explicitly specify a different tier for that specific blob.

Question: 429 CertyIQ

Which two features or services can be integrated with Azure Monitor? Each correct answer presents part of the solution.
NOTE: Each correct answer is worth one point.

A.Azure status
B.Application Insights
C.Azure Advisor
D.Log Analytics
E.Azure Service Health

Azure Monitor Core Architecture: Microsoft defines Azure Monitor as a comprehensive monitoring solution that collects, analyzes, and acts on telemetry from cloud and on-premises environments.

Log Analytics (Logs Store & Query Engine): Operates directly within Azure Monitor to index and query structured log telemetry using Kusto Query Language (KQL), serving as the underlying data store for multi-resource diagnostics.

Application Insights (Application Performance Management): A feature of Azure Monitor that monitors live applications (detecting performance anomalies, measuring page load times, tracking exceptions) and routes its collected metrics and traces directly into Azure Monitor Log Analytics workspaces.

Answer: BD

Explanation:

B. Application Insights: This is an extension of Azure Monitor that provides deep Application Performance Management (APM). It allows you to monitor live web applications, automatically detecting performance anomalies, logging exceptions, and tracking user behavior telemetry natively within Azure Monitor.

D. Log Analytics: This is the primary tool and repository within Azure Monitor used to edit, run, and analyze log queries against data collected from various cloud resources. All log data ingested into Azure Monitor is stored and queried in a Log Analytics workspace.

Question: 430 CertyIQ

What provides a unified way to project and manage non-Azure resources in Azure Resource Manager (ARM)?

A.Azure Migrate
B.Azure AD Connect
C.Azure Arc
D.Azure Front Door

Answer: C

Explanation:

C. Azure Arc.

Azure Arc is explicitly designed to extend Azure management, governance, and services to infrastructure outside of Azure.

It works by installing an agent on non-Azure resources (such as on-premises physical servers, virtual machines in AWS or GCP, or external Kubernetes clusters). Once the agent is installed, these external resources are projected as native resource objects inside Azure Resource Manager (ARM). This allows you to manage them, apply tags, and enforce Azure Policies just as if they were running natively inside Azure.

https://learn.microsoft.com/EN-us/azure/azure-arc/servers/manage-vm-extensions-template

Question: 431

CertyIQ

HOTSPOT

-

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Statement 1 (Yes): AzCopy is an official command-line utility designed to copy blobs, directories, and files into or out of Azure Storage accounts (Blob and File storage), as well as between different storage accounts.

Statement 3 (Yes): Azure File Sync centralizes an organization's file shares in Azure Files while keeping the flexibility, performance, and compatibility of an on-premises Windows file server with seamless bi-directional synchronization and cloud tiering.

Answer Area

Statements	Yes	No
AzCopy is a command-line utility used to copy blobs or files to or from a storage account.	○	○
Azure Storage Explorer is a cloud-hosted migration service used to transfer large amounts of data.	○	○
Azure File Sync syncs files and folders between Azure Files and Windows file servers.	○	○

Statement 2 (No): Azure Storage Explorer is a standalone GUI desktop application that you install locally on Windows, macOS, or Linux to manage Azure cloud storage resources visually. It is neither "cloud-hosted" nor a dedicated bulk migration service (services dedicated to large-scale/cloud-hosted migrations include Azure Data Box, Storage Mover, or Azure Data Factory).

Answer:

Answer Area

Statements	Yes	No
AzCopy is a command-line utility used to copy blobs or files to or from a storage account.	○	○
Azure Storage Explorer is a cloud-hosted migration service used to transfer large amounts of data.	○	○
Azure File Sync syncs files and folders between Azure Files and Windows file servers.	○	○

Explanation:

YNY It´s correctAzCopy is a command-line utility that you can use to copy blobs or files to or from a storage accounthttps://learn.microsoft.com/en-us/azure/storage/common/storage-use-azcopy-v10Microsoft Azure Storage Explorer is a standalone app that makes it easy to work with Azure Storage data on Windows, macOS, and Linux. "https://learn.microsoft.com/en-us/azure/vs-azure-tools-storage-manage-with-storage-explorer?tabs=windows"

Question: 432

CertyIQ

HOTSPOT

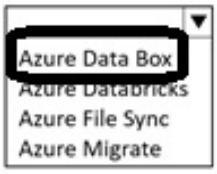
-

Select the answer that correctly completes the sentence.

[▼] is a physical migration service used to transfer large amounts of data in a quick, inexpensive, and reliable way.

- Azure Data Box
- Azure Databricks
- Azure File Sync
- Azure Migrate

Answer:



is a physical migration service used to transfer large amounts of data in a quick, inexpensive, and reliable way.

Explanation:

Azure Data Box is correct "The Microsoft Azure Data Box cloud solution lets you send terabytes of data into and out of Azure in a quick, inexpensive, and reliable way."

https://learn.microsoft.com/en-us/azure/databox/data-box-overview

Question: 433 CertyIQ

Your company has an Azure subscription and three business units.
You plan to deploy new resources for each business unit.
You need to ensure that the new resources are deployed by using a repeatable and reliable method that applies the same configurations to each resource.
What should you use?

A.Azure Policy
B.Azure Arc
C.a resource group
D.Azure Resource Manager (ARM) templates

Answer: D

Explanation:

The correct answer is D. Azure Resource Manager (ARM) templates.

ARM templates are JavaScript Object Notation (JSON) files that define the infrastructure and configuration for your project. They use Infrastructure as Code (IaC), which allows you to define what you want to deploy in a declarative way.

Because the configuration is defined in a file, you can reuse that same template to deploy resources across multiple business units. This directly satisfies the requirement for a repeatable and reliable method that ensures the exact same configurations are applied every time.

Question: 434 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 1 (Yes): Azure ExpressRoute relies on Border Gateway Protocol (BGP) (specifically eBGP) to exchange dynamic routing information between the customer's on-premises network (or connectivity provider) and Microsoft Enterprise edge routers (MSEE).

Statement 2 (No): By core architectural definition, ExpressRoute connections do not travel over the public internet. Instead, they establish a dedicated, private Layer 2/Layer 3 connection via a third-party connectivity partner or direct optical fiber peering directly into Microsoft's global network backbone.

Statement 3 (Yes): Organizations can link an on-premises datacenter to multiple ExpressRoute circuits (often through geographically separated peering locations or diverse connectivity providers) to implement high availability, failover, or traffic segmenting into multiple Azure virtual networks.

Answer Area

Statements	Yes	No
ExpressRoute uses Border Gateway Protocol (BGP).	○	○
ExpressRoute uses the internet to connect an on-premises network to Azure.	○	○
You can configure multiple ExpressRoute circuits to connect an on-premises datacenter to Azure.	○	○

Answer:

Answer Area

Statements	Yes	No
ExpressRoute uses Border Gateway Protocol (BGP).	○	○
ExpressRoute uses the internet to connect an on-premises network to Azure.	○	○
You can configure multiple ExpressRoute circuits to connect an on-premises datacenter to Azure.	○	○

Explanation:

YNY is correct introduction"Dynamic routing between your network and Microsoft via BGP."

https://learn.microsoft.com/en-us/answers/questions/633891/connecting-multiple-expressroute-circuit-with-a-si"Yes, it is possible. You can link a single virtual network with up to four ExpressRoute circuits in the same location or up to 16 ExpressRoute circuits in different peering locations.Reference : https://learn.microsoft.com/en-au/azure/expressroute/expressroute-faqs#can-i-have-one-virtual-network-connected-to-more-than-one-expressroute-circuitExpressRoutes don't go over the internet, hence ExpressRoute.Rather, it is strongly recommended that customers setup at least two ExpressRoute circuits to avoid single points of failure"

Reference:

https://learn.microsoft.com/en-us/azure/expressroute/expressroute

Question: 435

CertyIQ

Statement 1 (Yes): Azure Arc-enabled servers supports both physical bare-metal hardware and virtual machines running supported distributions of Linux (as well as Windows Server) hosted on-premises or across other cloud providers by installing the Connected Machine agent.

HOTSPOT

-

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure Arc can manage physical servers that run Linux.	○	○
Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.	○	○
Azure Arc can manage a third-party database solution hosted outside of Azure.	○	○

Statement 2 (Yes): Azure Arc-enabled Kubernetes allows organizations to attach and manage Kubernetes clusters running anywhere, including native Azure Kubernetes Service (AKS) clusters (and AKS on Azure Stack HCI/edge) alongside external clusters (EKS, GKE, upstream Kubernetes). This provides centralized GitOps configuration, policy enforcement, and operational governance at scale across all clusters from the Azure control plane.

Answer:

Statement 3 (No): Azure Arc cannot arbitrarily manage third-party proprietary database management engines (like Oracle Database, SAP HANA, or MySQL/MariaDB instances) hosted outside Azure. Azure Arc's database management capabilities are specifically restricted to SQL Server instances (via Azure Arc-enabled SQL Server) and deploying containerized Azure data services (Azure SQL Managed Instance and previously previewed Azure Arc-enabled PostgreSQL).

Answer Area

Statements	Yes	No
Azure Arc can manage physical servers that run Linux.	☐	○
Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.	☐	○
Azure Arc can manage a third-party database solution hosted outside of Azure.	○	☐

Explanation:

Statement 1: Azure Arc can manage physical servers that run Linux.

Answer: Yes

Azure Arc-enabled servers allow you to connect physical or virtual machines hosted outside of Azure (such as on-premises data centers, AWS, or GCP) to Azure's control plane. By installing the Connected Machine agent on a physical server running Linux (or Windows), that machine becomes represented as a resource in Azure, allowing you to govern and monitor it using Azure tools.

Statement 2: Azure Arc can manage Azure Kubernetes Service (AKS) clusters at scale.

Answer: Yes

Azure Arc-enabled Kubernetes allows you to attach and configure Kubernetes clusters both inside and outside of Azure. Specifically, when dealing with hybrid footprints or edge deployments (such as AKS on Azure Stack HCI or AKS Edge Essentials), Azure Arc acts as the centralized management pane to deploy GitOps configurations, enforce Azure Policies, and view cluster health at scale across your entire organization.

Statement 3: Azure Arc can manage a third-party database solution hosted outside of Azure.

Answer: No

Azure Arc-enabled data services are explicitly designed to bring Azure SQL Managed Instances and Azure Arc-enabled PostgreSQL to on-premises, edge, and multi-cloud environments via Kubernetes. It does not manage proprietary or arbitrary third-party database solutions (such as an on-premises Oracle database or a native AWS Amazon RDS instance) directly; it only extends Microsoft's own managed cloud database services to non-Azure infrastructure.

Question: 436 CertyIQ

HOTSPOT

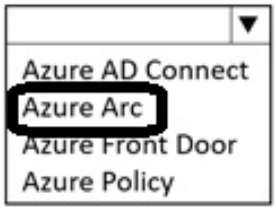
-

Select the answer that correctly completes the sentence.

[▼] extends Azure compliance and monitoring to hybrid and multicloud configurations

- Azure AD Connect
- Azure Arc
- Azure Front Door
- Azure Policy

Answer:



extends Azure compliance and monitoring to hybrid and multicloud configurations

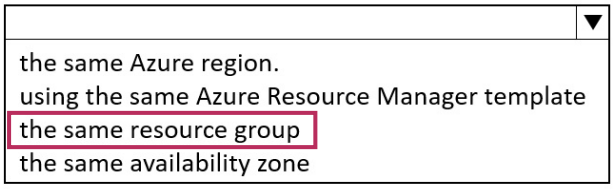
Explanation:

Azure Arc is a specialized management and governance plane designed to project non-Azure resources into the Azure Resource Manager (ARM) framework. This allows enterprises to operate hybrid, edge, and multi-cloud environments using unified cloud native tools.

Question: 437 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

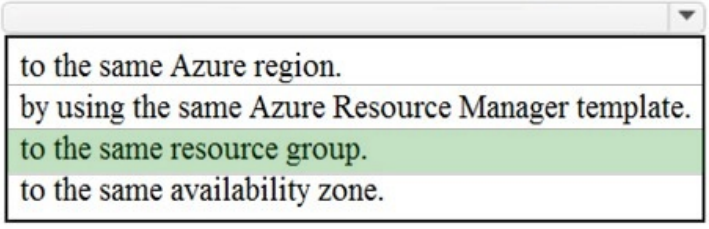
When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines



Answer:

Answer Area

When you need to delegate permissions to several Azure virtual machines simultaneously, you must deploy the Azure virtual machines



Explanation:

A resource group is a logical container for Azure resources. Resource groups make the management of Azure resources easier.

With a resource group, you can allow a user to manage all resources in the resource group, such as virtual machines, websites, and subnets. The permissions you apply to the resource group apply to all resources contained in the resource group.

Reference:

https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups
https://docs.microsoft.com/en-us/azure/role-based-access-control/overview

Question: 438 CertyIQ

Where does Azure Monitor store event data?

A.an Azure Blob Storage account
B.Azure Storage Queue
C.Azure SQL Database
D.a Log Analytics workspace

Azure Monitor Logs Data Platform: Azure Monitor stores telemetry in two fundamental data types: Metrics (numerical values stored in a lightweight time-series database) and Logs (events, traces, performance records, and activity records).

All log and event data collected by Azure Monitor (from guest OS event logs, diagnostic settings, Activity Logs, and Application Insights) is organized and stored inside a Log Analytics workspace.

The workspace provides the underlying storage tables and executes queries written in Kusto Query Language (KQL) to retrieve, filter, and visualize event records.

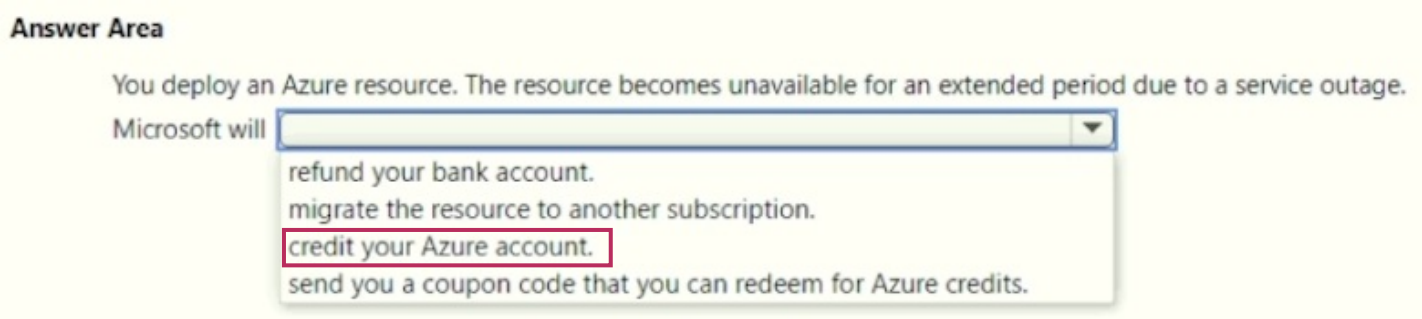
Answer: D

Explanation:

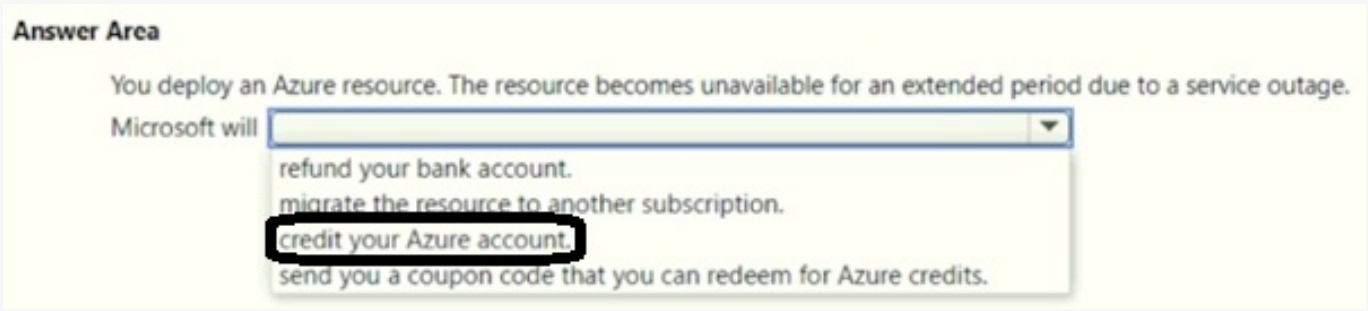
D. a Log Analytics workspace Azure Monitor stores event data in a Log Analytics workspace. This is a unique environment for Azure Monitor log data, where you can use Log Analytics to analyse collected data across sources. Each workspace has its own data repository and configuration, and data sources and solutions are configured to store their data in a workspace.

Question: 439 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.



Answer:



Explanation:

You deploy an Azure resource. The resource becomes unavailable for an extended period due to a service outage. Microsoft will credit your Azure account.

Question: 440 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure,
- reduce the number of connections to the website.

Answer:

Answer Area

When planning to migrate a public website to Azure, you must plan to

- deploy a VPN.
- pay monthly usage costs.
- pay to transfer all the website data to Azure,
- reduce the number of connections to the website.

Explanation:

Public cloud platforms like Azure run entirely on a consumption-based utility scheme. Instead of paying massive upfront costs for physical hardware, infrastructure racks, and server components that you have to depreciate over years, you pay only for the resources you actively consume. These are aggregated and billed as monthly usage costs.

Question: 441

CertyIQ

HOTSPOT

-

Select the answer that correctly completes the sentence.

Answer Area

If a resource group named RG1 has a delete lock, can delete RG1.

- only a member of the global administrators group
- the delete lock must be removed before an administrator
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Answer:

Answer Area

If a resource group named RG1 has a delete lock, can delete RG1.

- only a member of the global administrators group
- the delete lock must be removed before an administrator
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Explanation:

delete lock must be removed before an administrator .

Question: 442

CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer:

Explanation:

Azure Resource Management Templates provide.

Question: 443

CertyIQ

An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Which three computers can run the script? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A.a computer that runs Windows 11 and has the Azure CLI tools installed
B.a computer that runs Linux and has the Azure CLI tools installed
C.a computer that runs macOS and has PowerShell Core 6.0 installed
D.a computer that runs Chrome OS and uses Azure Cloud Shell
E.a computer that runs Windows 10 and has the Azure PowerShell module installed

Answer: CDE

Explanation:

C. A computer that runs macOS and has PowerShell Core 6.0 installed.

PowerShell Core 6.0 is cross-platform and can run on macOS. If the Azure PowerShell module is also installed, this computer can run the script.

D. A computer that runs Chrome OS and uses Azure Cloud Shell.

Azure Cloud Shell supports both Bash and PowerShell. If the Cloud Shell is configured to use PowerShell, it can run the script.

E. A computer that runs Windows 10 and has the Azure PowerShell module installed.

Windows 10 supports PowerShell, and with the Azure PowerShell module installed, it can run the script to create Azure resources.

Question: 444

CertyIQ

HOTSPOT
-

Statement 1 (No): Microsoft Entra ID (formerly Azure AD) is a fully managed cloud-native identity and access management platform (IDaaS / SaaS). It does not require deploying, running, or maintaining traditional Active Directory Domain Services (AD DS) domain controllers on Azure virtual machines.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 2 (Yes): Microsoft Entra ID serves as the centralized identity provider and backbone authentication mechanism across Microsoft cloud services, providing Single Sign-On (SSO) and identity verification for both Microsoft Azure (ARM/portal/CLI) and Microsoft 365 suite services (Exchange Online, SharePoint, Teams).

Answer Area

Statements	Yes	No
Azure AD requires domain controllers on Azure virtual machines.	○	○
Azure AD provides authentication services for Azure and Microsoft 365.	○	○
Each user account in Azure AD can be assigned only one Microsoft 365 license.	○	○

Answer:

Statement 3 (No): A single user account in Microsoft Entra ID can be assigned multiple licenses concurrently. For example, a single identity can have a Microsoft 365 E5 license combined with standalone add-ons such as Microsoft Copilot for Microsoft 365, Power BI Pro, Microsoft Defender for Endpoint, or Visio Plan 2.

Answer Area

Statements	Yes	No
Azure AD requires domain controllers on Azure virtual machines.	○	○
Azure AD provides authentication services for Azure and Microsoft 365.	○	○
Each user account in Azure AD can be assigned only one Microsoft 365 license.	○	○

Explanation:

Statement 1: Azure AD requires domain controllers on Azure virtual machines.

Answer: No

Explanation: Azure AD is a cloud-native, identity-as-a-service (IdaaS) platform. Unlike traditional on-premises Active Directory Domain Services (AD DS), it does not rely on a structural backbone of physical or virtualized domain controllers (DCs) running Windows Server. Microsoft handles the entire underlying scaling and infrastructure natively; you simply consume directory capabilities over the web.

Statement 2: Azure AD provides authentication services for Azure and Microsoft 365.

Answer: Yes

Explanation: Azure AD serves as the central identity engine and trust provider for Microsoft's entire cloud landscape. When a user tries to access the Azure Portal, connect to an Exchange Online mailbox, or open Microsoft Teams, Azure AD handles user authentication, evaluates Conditional Access policies, and issues security tokens.

Statement 3: Each user account in Azure AD can be assigned only one Microsoft 365 license.

Answer: No

Explanation: A single identity object in Azure AD can be assigned multiple licenses concurrently. For example, a specialized user could simultaneously hold a Microsoft 365 E5 license for their core productivity suite, a standalone Power BI Premium license for advanced data analytics, and an individual Dynamics 365 license for CRM access

Question: 445 CertyIQ

In the infrastructure as a service (IaaS) cloud service model, which two components are the responsibility of the cloud service provider? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A.the configuration and maintenance of storage
B.the installation and configuration of the operating system
C.maintaining the hardware
D.the network configuration
E.physical security of the datacenter infrastructure

Answer: CE

Explanation:

C. maintaining the hardware (Correct): The provider is responsible for purchasing, racking, power-cycling, and repairing the physical servers, blades, memory modules, and physical storage host arrays that sit inside their data centers.

E. physical security of the datacenter infrastructure (Correct): The provider owns the physical security boundary. This includes biometric access controls, security cameras, perimeter fencing, onsite guards, and environmental protections (like fire suppression and cooling) to ensure unauthorized personnel cannot gain physical access to the hosts running your data.

Azure Blob Storage Access Tiers: Microsoft defines specific operational criteria, minimum retention durations, and cost trade-offs for each online and offline storage tier.

Cool Access Tier: Designed for data that is infrequently accessed and stored for a minimum duration of 30 days. It offers lower storage capacity costs than the Hot tier but charges slightly higher transaction and data retrieval fees.

Question: 446 CertyIQ

HOTSPOT
-
If a blob in the Cool tier is modified or deleted prior to the 30-day minimum retention period, an early deletion fee equivalent to the remaining days is billed.

Select the answer that correctly completes the sentence.

Answer Area

The Cool access tier is optimized

- for data that is accessed infrequently and stored for at least 30 days.
- for data that is accessed rarely, is stored for at least 180 days, and has flexible latency requirements.
- for storing data that is accessed frequently.

Answer:

Answer Area

The Cool access tier is optimized

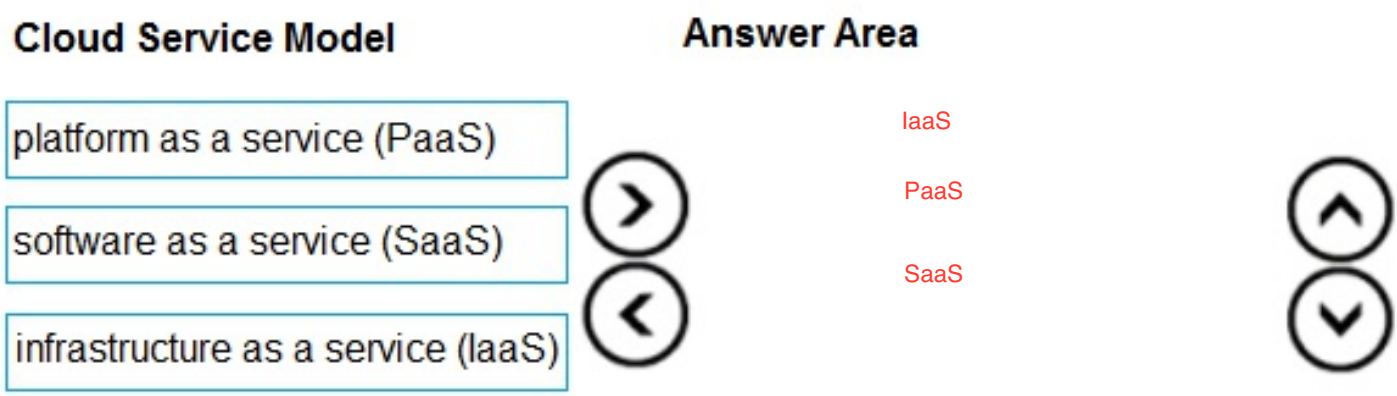
- for data that is accessed infrequently and stored for at least 30 days.
- for data that is accessed rarely, is stored for at least 180 days, and has flexible latency requirements.
- for storing data that is accessed frequently.

Explanation:

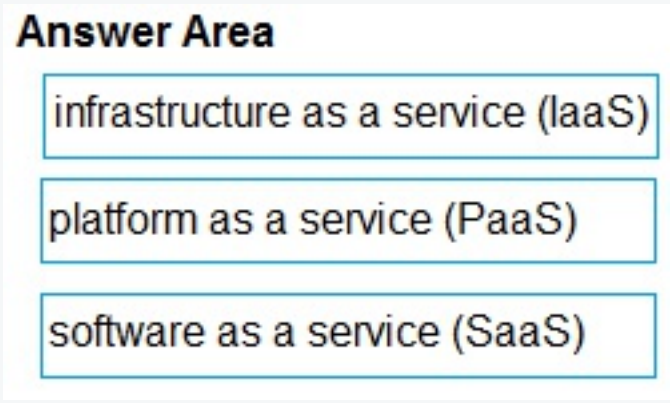
For data that is accessed infrequently and stored for at least 30 days.

Question: 447 CertyIQ

DRAG DROP
-
You need to identify a customer's level of shared responsibility based on the cloud service model.
In which order should you list each model from most customer responsibility to least customer responsibility? To answer, move all models from the list of models to the answer area and arrange them in the correct order.



Answer:



Explanation:

Infrastructure as a Service (IaaS)

Platform as a Service (PaaS)

Software as a Service (SaaS)

Question: 448 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Statement 1 (No): In Platform as a Service (PaaS, e.g., Azure App Service, Azure SQL Database), the cloud provider (Microsoft) owns and manages the physical infrastructure, virtualization hypervisor, hardware, and operating system (OS patching, updating, and maintenance). The customer only manages the application code and data.

Statement 2 (No): In Infrastructure as a Service (IaaS, e.g., Azure Virtual Machines), Microsoft is responsible only for the physical network cables, switches, and datacenter hardware. Network controls—including configuring Virtual Networks (VNets), subnets, routing tables, Network Security Groups (NSGs), firewall rules, and IP addressing—are the direct responsibility of the customer.

Answer Area

Statements	Yes	No
For the platform as a service (PaaS) cloud service, updating the operating system is the responsibility of the customer.	◯	◯
For the infrastructure as a service (IaaS) cloud service, network control is the responsibility of Microsoft.	◯	◯
For the software as a service (SaaS) cloud service, identity management is a shared responsibility between the customer and Microsoft.	◯	◯

Answer:

Statement 3 (No): The official Microsoft Learn documentation on Shared Responsibility in the Cloud explicitly states:
"For all cloud deployment types, you own your data and identities. You're responsible for protecting the security of your data and identities, on-premises resources, and the cloud components you control."
Because the customer manages the creation, permissions, lifecycle, and access governance of user identities, accounts, and directory access, identity management is classified as customer responsibility, not a shared responsibility.

Answer Area

Statements	Yes	No
For the platform as a service (PaaS) cloud service, updating the operating system is the responsibility of the customer.	◯	◯
For the infrastructure as a service (IaaS) cloud service, network control is the responsibility of Microsoft.	◯	◯
For the software as a service (SaaS) cloud service, identity management is a shared responsibility between the customer and Microsoft.	◯	◯

Explanation:

No

No

yes

Reference:

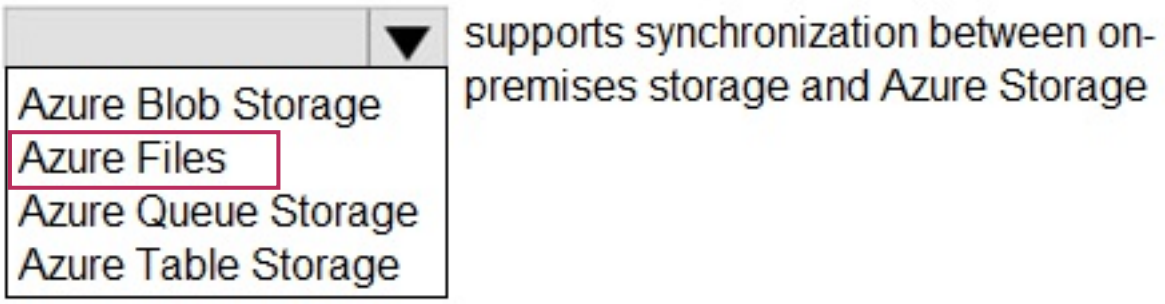
Question: 449

CertyIQ

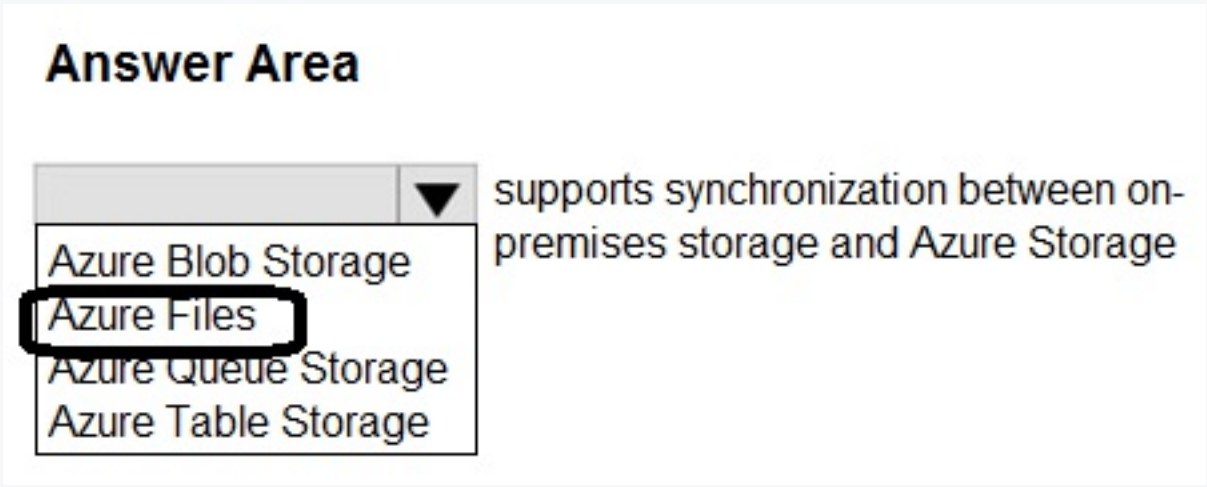
HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

Azure Files supports synchronization between on-premises storage and Azure Storage.

Full Technical Breakdown

The capability highlighted in this question refers to a native synchronization service called Azure File Sync. This service extends the capabilities of Azure Files to transform your on-premises Windows Servers into a local, high-speed cache for your cloud file shares.

Question: 450 CertyIQ

You have an Azure Storage account named storage1.
You need to ensure that containers can be created in, but not deleted from, storage1.
What should you do?

A.Create a ReadOnly lock for storage1.
B.Create a delete lock for storage1.
C.Enable container soft delete.
D.Enable blob soft delete.

Answer: B

Explanation:

Create a delete lock for storage1.

Question: 451

CertyIQ

You have an Azure subscription.
You need to use Azure Cloud Shell to run a deployment script.
What should you use to access Cloud Shell?

A.Azure Resource Manager (ARM)
B.Microsoft Visual Studio
C.a Windows command prompt
D.a web browser

Answer: D

Explanation:

Correct answer is D:a web browser.

Question: 452

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Adding more RAM to a virtual machine is an example of Horizontal scaling.	○	○
Adding an additional virtual machine based upon demand is an example of Vertical scaling.	○	○
Horizontal scaling can occur automatically or manually.	○	○

Answer:

Answer Area

Statements	Yes	No
Adding more RAM to a virtual machine is an example of Horizontal scaling.	○	○
Adding an additional virtual machine based upon demand is an example of Vertical scaling.	○	○
Horizontal scaling can occur automatically or manually.	○	○

Explanation:

No

No

yes

https://learn.microsoft.com/en-us/azure/azure-monitor/autoscale/autoscale-overview#what-is-autoscale

Question: 453 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Creating and configuring a virtual network is part of the platform as a service (PaaS) cloud service model.	○	○
In the platform as a service (PaaS) cloud service model, updating code for an Azure web app is the customer's responsibility.	○	○
Configuring user access to a platform as a service (PaaS) cloud service model is the customer's responsibility.	○	○

Answer:

Answer Area

Statements	Yes	No
Creating and configuring a virtual network is part of the platform as a service (PaaS) cloud service model.	○	○
In the platform as a service (PaaS) cloud service model, updating code for an Azure web app is the customer's responsibility.	○	○
Configuring user access to a platform as a service (PaaS) cloud service model is the customer's responsibility.	○	○

Explanation:

No

yes

yes

Question: 454 CertyIQ

You need to migrate an on-premises server by using a lift-and-shift migration.
To which type of cloud service should you migrate?

A.infrastructure as a service (IaaS)

B.software as a service (SaaS)

C.platform as a service (PaaS)

Answer: A

Explanation:

A. infrastructure as a service (IaaS)

Rehosting Concept: A lift-and-shift migration (also called rehosting) means moving an on-premises physical or virtual server to the cloud exactly as-is, without altering its code or architecture.
Exact Fit for IaaS: Infrastructure as a Service provides virtual machines (VMs), storage, and networking. This directly mimics your on-premises datacenter hardware, allowing you to replicate your existing server setup identically in the cloud.

Question: 455 CertyIQ

HOTSPOT

-

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statement 2 (Yes): In an ARM or Bicep template, the "tags" property is a standard top-level JSON/Bicep object available under every deployable resource definition. You can declare static tags or compute dynamic tag values via template parameters and variables during automated infrastructure deployments.

Statements	Yes	No
Only one tag can be assigned to an Azure resource.	○	○
Tags can be assigned to Azure resources by using Azure Resource Manager (ARM) templates.	○	○
Tags can be used to enforce naming standards for Azure resources.	○	○

Answer:

Statement 3 (No): Tags are purely descriptive metadata labels used for grouping, billing, and resource taxonomy. They do not possess enforcement mechanisms. To enforce resource naming conventions (e.g., requiring prefixes like vm-prod-), you must use Azure Policy with regex pattern matching rules (such as like or match conditions) to audit or deny non-compliant resource creations.

Answer Area

Statements	Yes	No
Only one tag can be assigned to an Azure resource.	○	○
Tags can be assigned to Azure resources by using Azure Resource Manager (ARM) templates.	○	○
Tags can be used to enforce naming standards for Azure resources.	○	○

Explanation:

No

Yes

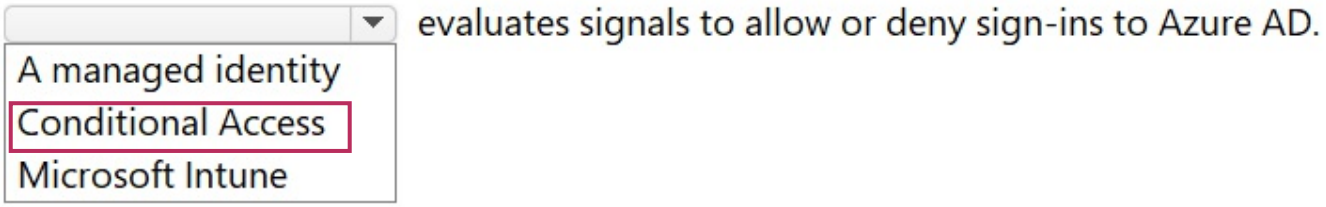
No

Question: 456 CertyIQ

HOTSPOT

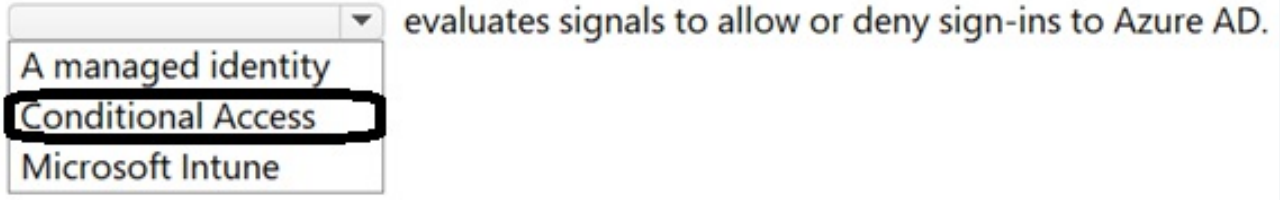
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

Answer Area



Explanation:

Conditional Access is the foundational policy engine at the core of Microsoft's Zero Trust identity architecture. It functions as an automated "if-then" statement matcher that aggregates real-time metrics before granting access to corporate resources.

Question: 457 CertyIQ

DRAG DROP
-
Match the Azure compute services to the appropriate descriptions.
To answer, drag the appropriate compute service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.

Compute services

- Azure App Service
- Azure Container Instances
- Azure Functions
- Azure Virtual Machine Scale Sets

Answer Area

Container Instance	Provides software emulation of a physical computer.
Virtual Machine Scale Set	Provides operating system virtualization.

Answer:

Answer Area

Azure Container Instances	Provides software emulation of a physical computer.
Azure Virtual Machine Scale Sets	Provides operating system virtualization.

Explanation:

Azure Container Instances .

Azure Virtual Machines scale Sets.

Question: 458

HOTSPOT

-

Statement 1 (Yes): Azure Advisor provides native support for Advisor Alerts. You can configure alerts to notify you via action groups (email, SMS, webhook, IT service management tools) whenever Azure Advisor detects a new recommendation matching specific criteria or categories (e.g., critical high-availability or security advisories).

CertyIQ

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure Advisor supports alerts.	○	○
Azure Advisor recommendations can be filtered by Administrative unit.	○	○
Azure Advisor provides recommendations on improving the performance of resources.	○	○

Statement 3 (Yes): Performance is one of the five core pillars of Azure Advisor (alongside Reliability, Security, Cost, and Operational Excellence). Advisor actively analyzes resource utilization to provide performance-tuning recommendations, such as provisioning Premium SSDs, scaling App Service plans, or optimizing database queries.

Answer:

Statement 2 (No): In Microsoft Entra ID, an Administrative Unit (AU) is an identity container used to restrict delegated administrative scope over users, groups, and devices. Advisor filters recommendations strictly across Azure Resource Manager management hierarchy boundaries—specifically by Subscriptions, Resource Groups, Workloads, and Tags—not by Entra ID Administrative Units.

Answer Area

Statements	Yes	No
Azure Advisor supports alerts.	○	○
Azure Advisor recommendations can be filtered by Administrative unit.	○	○
Azure Advisor provides recommendations on improving the performance of resources.	○	○

Explanation:

Statement 1: Azure Advisor supports alerts.

Answer: Yes

Azure Advisor integrates natively with Azure Monitor Alerts. This allows you to configure automated notification thresholds so that the moment a critical new recommendation is generated—such as a critical security vulnerability or an urgent cost-saving opportunity—an alert fires to notify engineering teams via email, SMS, push notifications, or webhooks.

Statement 2: Azure Advisor recommendations can be filtered by Administrative unit.

Answer: No

Administrative Units (AUs) are a logical container feature specific to Microsoft Entra ID used strictly for delegating administrative control over user accounts, groups, and device objects. Azure Advisor, on the other hand, operates within the Azure Resource Manager (ARM) scope hierarchy. Consequently, Advisor recommendations can be filtered by subscriptions, resource groups, workload tags, or recommendation status —not by identity directory boundaries like Administrative Units.

Statement 3: Azure Advisor provides recommendations on improving the performance of resources.

Answer: Yes

Performance is one of the five core pillars of the Microsoft Well-Architected Framework that Azure Advisor continuously evaluates. It monitors asset metrics (such as CPU, network bottlenecks, disk performance, or outdated database configurations) and surfaces actionable optimization recommendations to improve responsiveness, enhance throughput, or resolve critical resource constraints.

Question: 459 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You must install Azure Cloud Shell on your computer before you can use it.	○	○
The Azure Command-Line Interface (CLI) is installed by default in Windows 11.	○	○
Azure PowerShell can be used on computers that run Windows, Linux, or macOS.	○	○

Answer:

Answer Area

Statements	Yes	No
You must install Azure Cloud Shell on your computer before you can use it.	○	●
The Azure Command-Line Interface (CLI) is installed by default in Windows 11.	○	●
Azure PowerShell can be used on computers that run Windows, Linux, or macOS.	●	○

Explanation:

Statement 1: You must install Azure Cloud Shell on your computer before you can use it.

Answer: No

Explanation: Azure Cloud Shell is a browser-accessible, cloud-hosted terminal environment managed entirely by Microsoft. It requires absolutely zero local installation on your workstation. You simply launch it directly within the Azure Portal, through shell.azure.com, or via mobile apps, and it handles provisioning a temporary container pre-configured with standard command-line tools.

Statement 2: The Azure Command-Line Interface (CLI) is installed by default in Windows 11.

Answer: No

Explanation: Windows 11 ships with standard administrative command-line tools like Command Prompt and Windows PowerShell, but it does not come with the Azure CLI built-in. To execute az commands locally on your machine, you must explicitly download and run the MSI installer, or deploy it via package managers such as Winget (winget install Microsoft.AzureCLI).

Statement 3: Azure PowerShell can be used on computers that run Windows, Linux, or macOS.

Answer: Yes

Question: 460 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in a datacenter.	○	○
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in Azure.	○	○
The Total Cost of Ownership (TCO) Calculator generates graphical reports.	○	○

Answer:

Answer Area

Statements	Yes	No
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in a datacenter.	○	○
The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in Azure.	○	○
The Total Cost of Ownership (TCO) Calculator generates graphical reports.	○	○

Explanation:

Statement 1: The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in a datacenter.

Answer: No

Explanation: The purpose of the TCO Calculator is not to act as an independent estimator for on-premises data center operations. Instead, it is a migration comparison tool. While you do input your current data center infrastructure configurations (such as server specs, storage, labor, and electricity costs), it uses that data as a baseline to demonstrate how much money you would save by migrating those assets to Azure over a designated time horizon.

Statement 2: The Total Cost of Ownership (TCO) Calculator displays the cost of running workloads in Azure.

Answer: Yes

Explanation: To show financial differentiation, the TCO Calculator maps your baseline on-premises infrastructure inputs directly to equivalent Azure service configurations (such as Azure VMs, Azure Storage,

and Azure SQL). It then displays the projected costs of running those workloads in Azure so that you can directly compare cloud expenditures against on-premises overhead.

Statement 3: The Total Cost of Ownership (TCO) Calculator generates graphical reports.

Answer: Yes

Explanation: Once all infrastructure baseline parameters and cloud options are configured, the TCO Calculator compiles the results into a comprehensive final report. This report includes broken-down graphical dashboards, cost-comparison charts, and visual tables mapping savings across specific cost categories (such as compute, storage, networking, labor, and virtualization software). These can be downloaded as a PDF report for executive presentations

Question: 461 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Network security groups (NSGs) can contain multiple inbound and outbound security rules.	◯	◯
A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.	◯	◯
A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.	◯	◯

Answer:

Answer Area

Statements	Yes	No
Network security groups (NSGs) can contain multiple inbound and outbound security rules.	◉	◯
A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.	◉	◯
A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.	◯	◉

Explanation:

Statement 1: Network security groups (NSGs) can contain multiple inbound and outbound security rules.

Answer: Yes

An NSG acts as a basic packet-filtering firewall for your virtual network subnets or individual network interfaces (NICs). Within a single NSG, you can create multiple security rules (up to default limits, typically 1,000 rules per NSG). Each rule specifies a priority, source/destination, port, protocol, and an explicit action (Allow or Deny) for both incoming (inbound) and outgoing (outbound) traffic patterns.

Statement 2: A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.

Answer: Yes

A Network Virtual Appliance (NVA) is a specialized virtual machine image deployed directly into a virtual network. Instead of acting as a traditional server running standard applications, it is pre-configured to run

advanced networking functions — most commonly firewalls (such as Check Point, Palo Alto, or Fortinet), WAN optimizers, routers, or specialized load balancers.

Statement 3: A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.

Answer: No

While UDRs are frequently used to override system routing between subnets inside the same VNet (for example, forcing all traffic through an NVA firewall), they are not restricted to a single virtual network. UDRs can control out-of-network egress routing across a wide variety of boundaries, such as directing outbound traffic to an on-premises data center over a VPN Gateway/ExpressRoute, routing traffic out through a specific internet gateway, or directing traffic across interconnected networks via VNet Peering.

Question: 462 CertyIQ

Microsoft 365 is an example of which cloud service model?

A.infrastructure as a service (IaaS)
B.platform as a service (PaaS)
C.software as a service (SaaS)

Answer: C

Explanation:

C. software as a service (SaaS).

Microsoft 365 (formerly Office 365) provides cloud-based software applications like Word, Excel, Outlook, and Teams over the internet. With the SaaS model, Microsoft manages all the underlying infrastructure, middleware, and application software; users simply connect to and use the applications, typically through a web browser or locally installed software that is centrally managed via the cloud. This eliminates the need for users or organizations to worry about installation, maintenance, or management of the software or the infrastructure it runs on.

Question: 463 CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Azure DNS only supports public DNS domain names.	○	○
Azure virtual machines can register names in Azure DNS automatically.	○	○
Azure DNS can host a custom DNS domain.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure DNS only supports public DNS domain names.	○	◉
Azure virtual machines can register names in Azure DNS automatically.	◉	○
Azure DNS can host a custom DNS domain.	◉	○

Explanation:

Statement 1: Azure DNS only supports public DNS domain names.

Answer: No

Azure DNS fully supports both public and private name resolution. While it can host internet-facing public domains, it also provides Azure DNS Private Zones. Private zones allow you to configure and resolve custom, internal domain names within a virtual network (VNet) or across interconnected VNets without exposing those records or traffic to the public internet.

Statement 2: Azure virtual machines can register names in Azure DNS automatically.

Answer: Yes

When you link an Azure DNS Private Zone to a virtual network, you can enable a built-in feature called auto-registration. Once activated, when a new virtual machine is spun up and joined to that VNet, Azure DNS automatically tracks its lifecycle and registers an 'A' (address) record matching the VM's hostname and its private IP address. It will also automatically clean up the record if the VM is deleted.

Statement 3: Azure DNS can host a custom DNS domain.

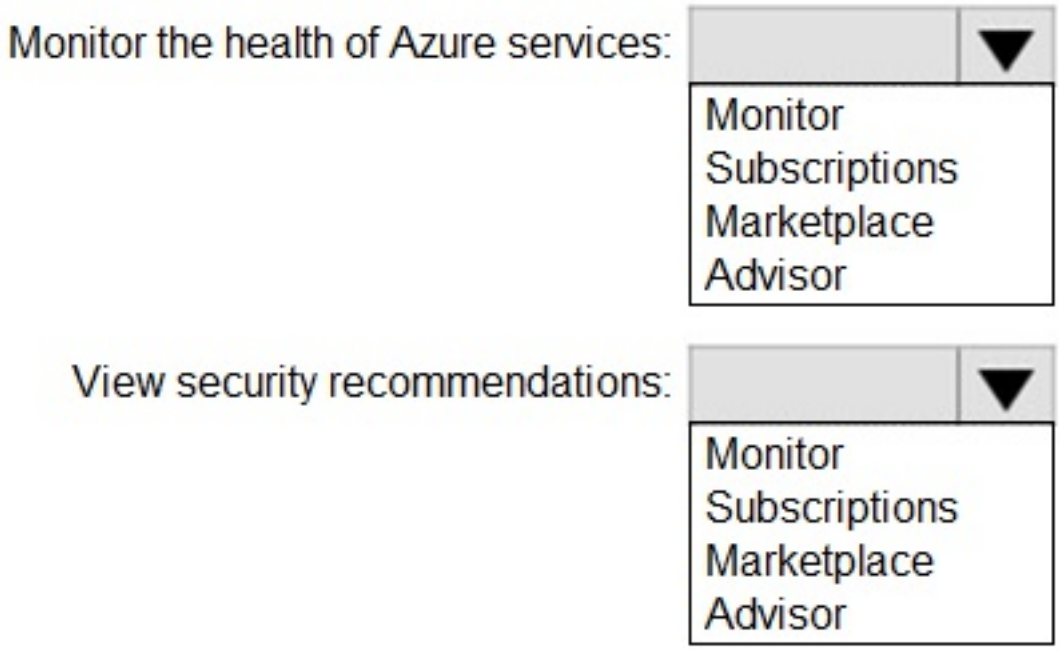
Answer: Yes

Azure DNS allows you to host your own custom registered domain name (such as contoso.com or mycompany.io). After you purchase a domain through a domain registrar, you simply create a DNS zone object in Azure and update your registrar's configuration to point to the designated Azure DNS name servers. This allows you to manage all of your custom DNS records natively using Azure portal menus, CLI tools, or ARM templates.

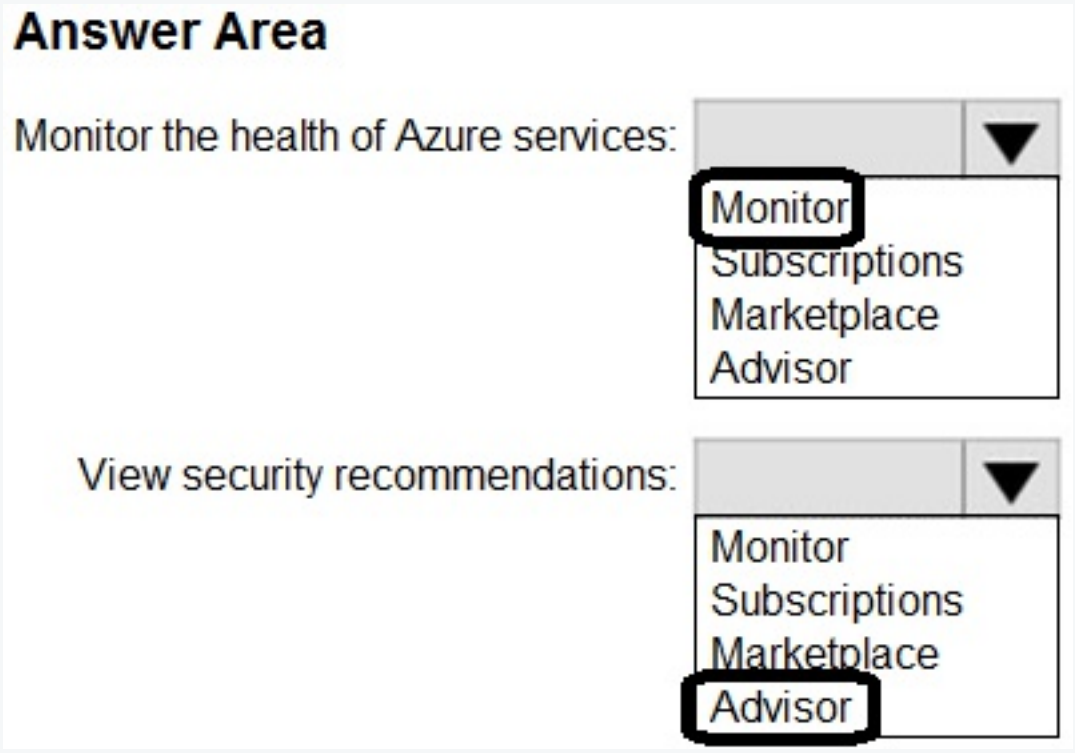
Question: 464 CertyIQ

HOTSPOT
-
You need to identify which blades in the Azure portal must be used to perform the following tasks:
•View security recommendations.
•Monitor the health of Azure services.
Which blade should you identify for each task? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer Area



Answer:



Explanation:

Dropdown 1: Monitor the health of Azure services $\rightarrow$ MonitorAzure Monitor is the centralized management hub for collecting, analyzing, and acting on telemetry from both your cloud and on-premises environments.Key Context: Within the Azure Monitor ecosystem, you can track infrastructure performance,

configure alerts, and gain direct access to Azure Service Health. Service Health keeps you continuously informed about global Azure service incidents, regional outages, planned infrastructure maintenance cycles, and specialized health advisories that specifically impact your running deployments.Dropdown

2: View security recommendations $\rightarrow$ Advisor Azure Advisor acts as a personalized, cloud-based optimization consultant that continuously analyzes your asset telemetry and resource configurations.Key Context: It compares your deployment patterns against the core tenets of the Microsoft Cloud Adoption Framework and Well-Architected Framework, surfacing specific actionable recommendations across five pillars: Security, Cost, Reliability, Operational Excellence, and Performance. Under the Security category, it integrates deeply with Microsoft Defender for Cloud to display crucial security hygiene recommendations (such as finding public-facing VMs missing standard network security groups or tracking unencrypted storage assets).

Question: 465

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The Cold access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Cool access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Archive access tier in Azure Storage is optimized for at least 180 days of data storage.	○	○

Answer:

Statements	Yes	No
The Cold access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Cool access tier in Azure Storage is optimized for at least 90 days of data storage.	○	○
The Archive access tier in Azure Storage is optimized for at least 180 days of data storage.	○	○

Explanation:

Statement 1: The Cold access tier in Azure Storage is optimized for at least 90 days of data storage.

Answer: No

The Cold access tier is a newer online storage tier positioned between Cool and Archive. It is explicitly optimized for storing data that is infrequently accessed or modified, with a minimum retention commitment of 30 days. Storing data in this tier for fewer than 30 days incurs an early deletion fee.

Statement 2: The Cool access tier in Azure Storage is optimized for at least 90 days of data storage.

Answer: No

Like the Cold tier, the Cool access tier is designed for short-to-medium-term storage of infrequently accessed data (such as backup datasets or telemetry logs). It also enforces a minimum duration profile of 30 days, rather than 90 days.

Statement 3: The Archive access tier in Azure Storage is optimized for at least 180 days of data storage.

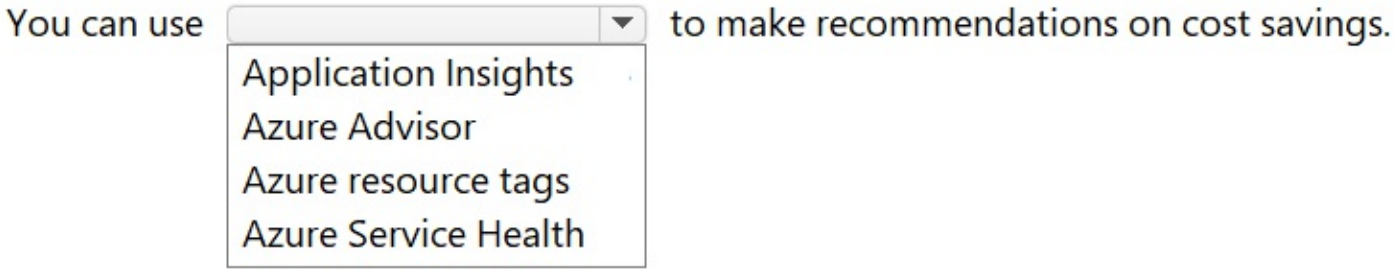
Answer: Yes

The Archive access tier is an offline tier optimized for rare-access baseline data, long-term compliance records, and legacy datasets. Because it offers the absolute lowest storage cost per gigabyte at the expense of higher data retrieval costs and latency (taking hours to rehydrate), Microsoft requires a long-term commitment. It is strictly optimized for a minimum of 180 days of continuous retention; deleting or moving blobs out of Archive prior to 180 days results in a prorated early deletion charge.

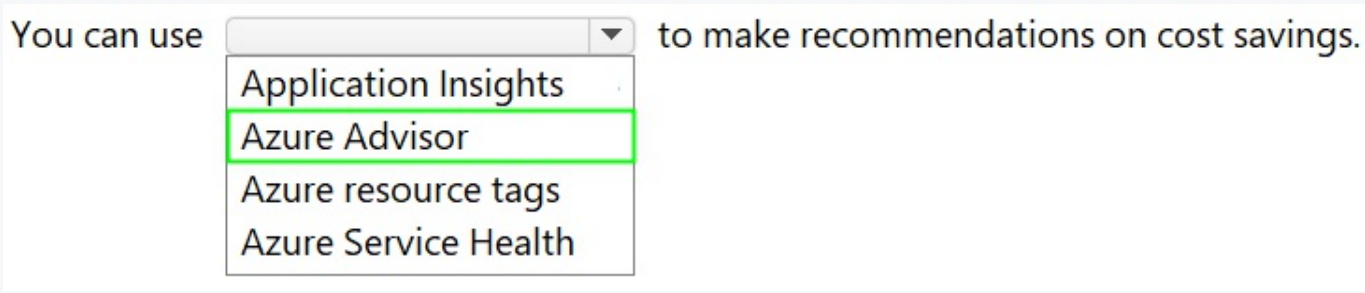
Question: 466 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area



Answer:

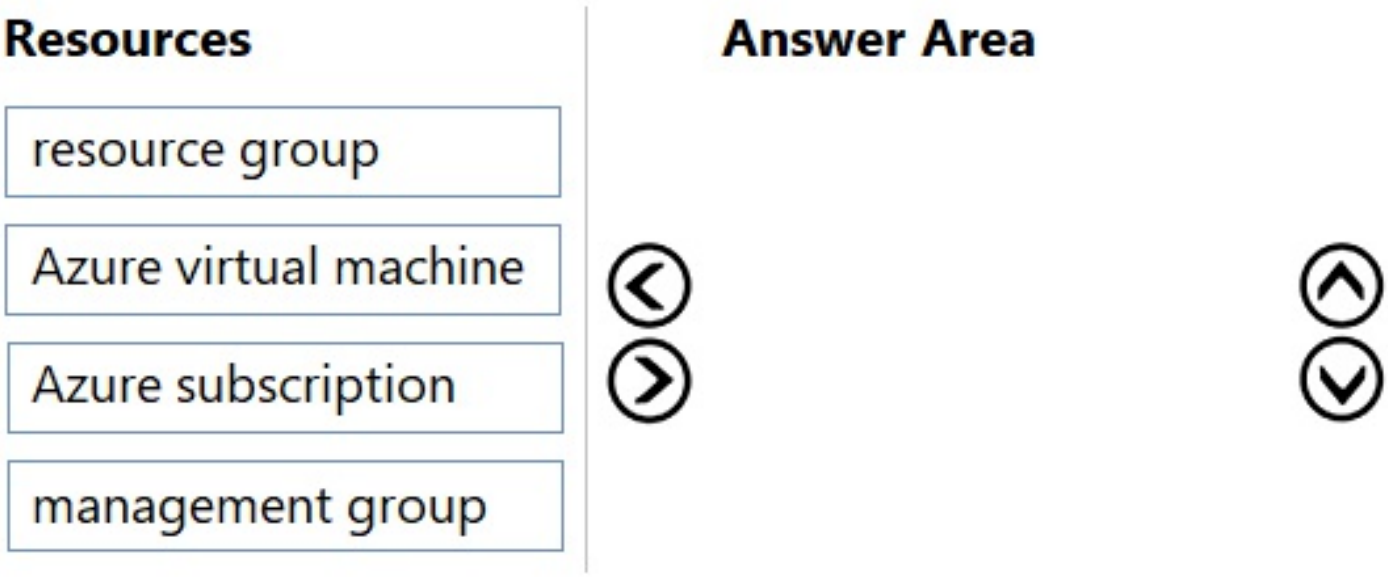


Explanation:

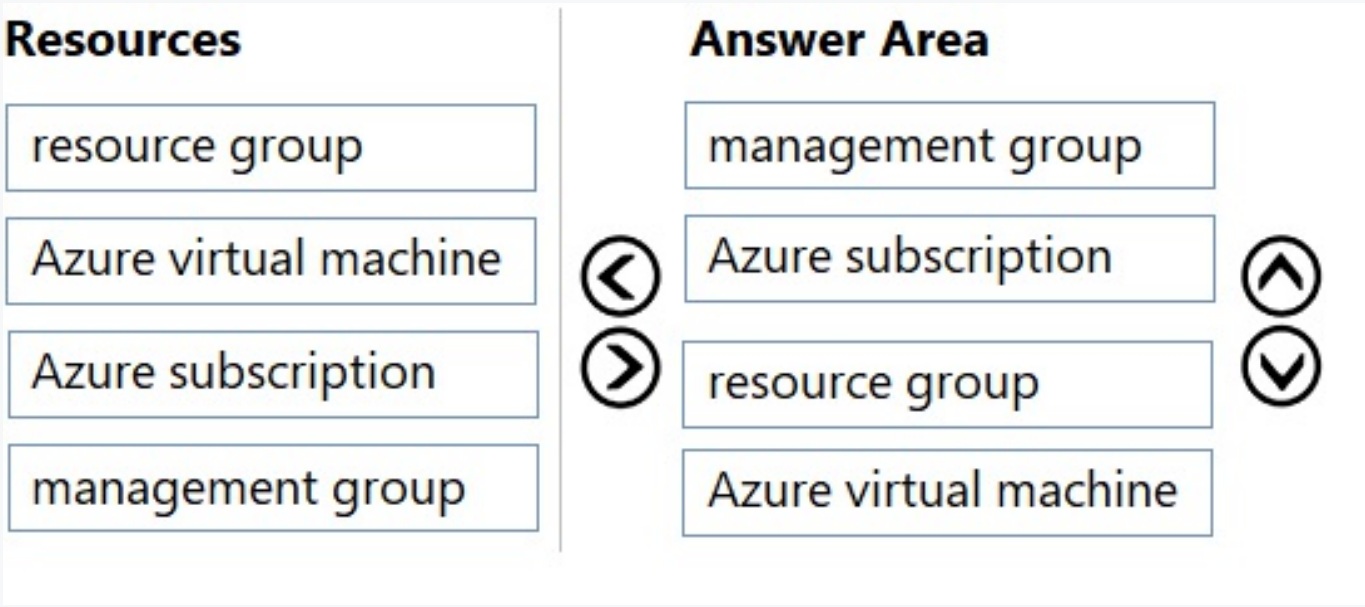
Azure Advisor is a cloud-based service provided by Microsoft Azure that offers personalized best practices recommendations to optimize Azure resources.

Question: 467 CertyIQ

DRAG DROP
-
In which order should you arrange the Azure resources from the highest parent object (top) to the lowest child object? To answer, move all resources from the list of resources to the answer area and arrange them in the correct order.



Answer:



Explanation:

Management group.

Azure subscription.

resource group.

Azure virtual machine.

Question: 468

CertyIQ

HOTSPOT
-
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
A read-only lock prevents users from deleting an Azure resource.	○	○
Users can modify an Azure resource that has a delete lock applied.	○	○
All Azure resources inherit the locks assigned to their parent resource group.	○	○

Answer:

Statements	Yes	No
A read-only lock prevents users from deleting an Azure resource.	○	○
Users can modify an Azure resource that has a delete lock applied.	○	○
All Azure resources inherit the locks assigned to their parent resource group.	○	○

Explanation:

Statement 1: A read-only lock prevents users from deleting an Azure resource.

Answer: Yes

In Azure Resource Manager (ARM), a ReadOnly lock is the most restrictive lock type available. It acts as an absolute barrier that prevents authorized users from both deleting and modifying the targeted resource. Because it entirely prevents destructive actions, it inherently blocks deletion.

Statement 2: Users can modify an Azure resource that has a delete lock applied.

Answer: Yes

A CanNotDelete (Delete) lock restricts only the removal/deletion of an infrastructure asset. Unlike a read-only lock, it explicitly permits normal operational modifications, configuration adjustments, and property updates. For example, if you place a delete lock on a production database or virtual machine, engineers can still update scale settings, patch software, or adjust configurations, but any accidental attempt to terminate the resource will be blocked.

Statement 3: All Azure resources inherit the locks assigned to their parent resource group.

Answer: Yes

Azure Resource Manager locks enforce a strict top-down inheritance model. When you assign a lock at a higher organizational scope — such as a Management Group, an Azure Subscription, or a parent Resource Group — that lock automatically applies to every child resource existing within that boundary, as well as any new resources deployed into it later. A user cannot bypass a resource group lock at the individual resource level without administrative permissions to remove the lock from the parent scope first.

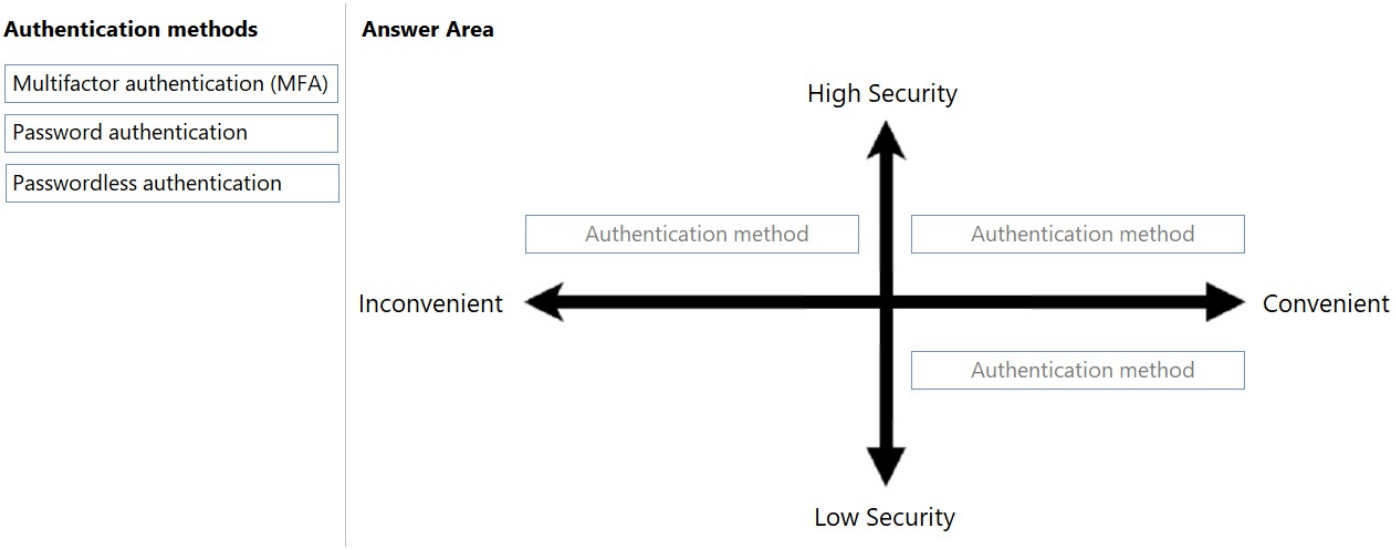
Question: 469 CertyIQ

DRAG DROP

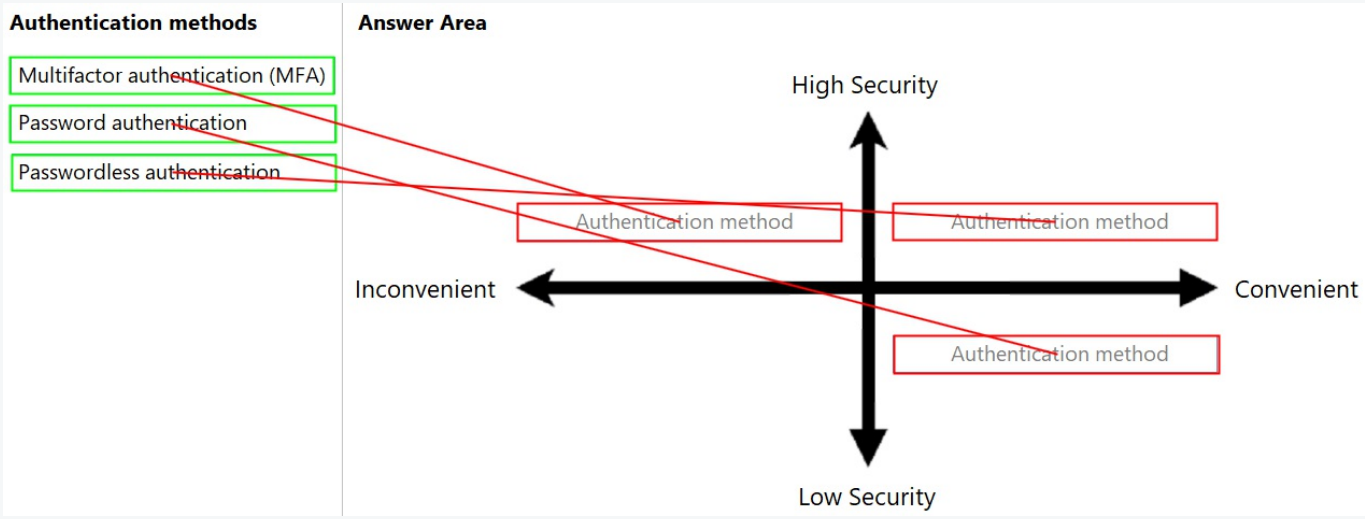
-

Match the authentication method to the appropriate level of security.

To answer, drag the appropriate authentication method from the column on the left to its level of security on the right.
NOTE: Each correct match is worth one point.



Answer:



Question: 470

CertyIQ

How many data copies are stored in gee-zone-redundant storage (GZRS)?

A.2
B.3
C.6
D.12

Answer: C

Explanation:

C. 6.

Geo-Zone-Redundant Storage (GZRS) combines the high availability of Zone-Redundant Storage (ZRS) with the regional disaster recovery protection of Geo-Redundant Storage (GRS). It replicates your data across a total of 6 copies split between two distinct geographic regions:

Question: 471 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

If you delete data from [ ] before 30 days has elapsed, you must pay an early deletion fee.

- an Azure Cosmos DB datastore
- Azure SQL Database
- the cool access tier of Azure Blob Storage
- the hot access tier of Azure Blob Storage

Answer:

If you delete data from [the cool access tier of Azure Blob Storage] before 30 days has elapsed, you must pay an early deletion fee.

Explanation:

The Cool Access Tier: This tier is designed for data that is infrequently accessed and expected to remain stored for at least 30 days. If a blob is deleted, overwritten, or moved to another tier before that 30-day window finishes, Azure charges a prorated early deletion fee equivalent to the remaining days of storage.

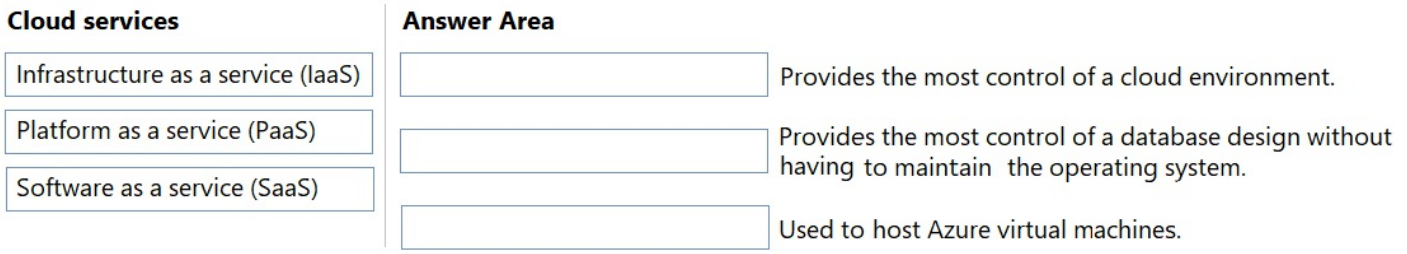
The Hot Access Tier: Optimized for frequent read/write access. It has no minimum storage duration requirement and charges no early deletion penalties, though its baseline storage cost per gigabyte is higher.

The Cold Access Tier: Optimized for even less frequent access than Cool, carrying a minimum storage duration commitment of 30 days.

The Archive Access Tier: An offline tier meant for long-term data retention. It carries a minimum duration commitment of 180 days.

Question: 472 CertyIQ

DRAG DROP
-
Match the cloud service to the appropriate description.
To answer, drag the appropriate cloud service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.



Answer:

Explanation:

1. Provides the most control of a cloud environment. $\rightarrow$ Infrastructure as a service (IaaS)Explanation: Of all the cloud delivery models, IaaS grants you the maximum degree of administrative governance and architectural control. Because the cloud provider only provisions the physical hardware and virtualization hypervisor layer, you have full ownership from the operating system up. This means you control OS configurations, local security policies, installed runtimes, and deep networking adjustments.

2. Provides the most control of a database design without having to maintain the operating system. $\rightarrow$ Platform as a service (PaaS)Explanation: This is the quintessential definition of a database-oriented PaaS model (such as Azure SQL Database). The cloud provider completely abstracts away, automates, and maintains the underlying virtual machines, OS patches, physical storage allocation, and backups. This frees your engineering teams from infrastructure maintenance, allowing them to focus entirely on designing high-level database schemas, writing optimized SQL queries, indexing tables, and regulating data permissions.

3. Used to host Azure virtual machines. $\rightarrow$ Infrastructure as a service (IaaS)Explanation: When you spin up computing instances in the cloud, you are directly leveraging IaaS. You select the underlying computing specs (vCores, RAM) and your preferred operating system image (such as Windows Server or Ubuntu Linux). Once provisioned, that virtual disk space and OS environment belong entirely to you to manage, configure, and maintain over its operational lifecycle.

Question: 473 CertyIQ

HOTSPOT
-
Select the answer that correctly completes the sentence.

Answer Area

A cloud service provider's service-level agreement (SLA) expresses [ ] as a percentage of uptime over a given year.

availability
elasticity
reliability
scalability

Answer:

A cloud service provider's service-level agreement (SLA) expresses availability as a percentage of uptime over a given year.

availability
elasticity
reliability
scalability

Explanation:

A Service-Level Agreement (SLA) is a contract between a service provider and a customer that defines the expected level of service. In the context of cloud computing, one of the most important metrics defined in an SLA is uptime, and this is expressed as a percentage of availability over a given period, typically one year.

Question: 474 CertyIQ

What can you use to make recommendations that will reduce Azure costs?

A.Azure Advisor
B.Log Analytics
C.Azure Service Health
D.the Azure pricing calculator

Answer: A

Explanation:

Azure Advisor: Azure Advisor is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. It provides recommendations to reduce costs, improve performance, enhance security, and ensure high availability. For cost reduction specifically, Azure Advisor analyzes your resource configurations and usage patterns, then identifies opportunities to reduce your overall spend. This can include recommendations like resizing or shutting down underutilized resources, adopting reserved

instances, and more.

Thank you

Thank you for being so interested in the premium exam material.
I'm glad to hear that you found it informative and helpful.

If you have any feedback or thoughts on the bumps, I would love to hear them.
Your insights can help me improve our writing and better understand our readers.

Best of Luck

You have worked hard to get to this point, and you are well-prepared for the exam
Keep your head up, stay positive, and go show that exam what you're made of!
