Question: 159 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

A Resource Group is strictly a logical management and lifecycle container, not a network boundary, security isolation perimeter, or communication barrier. Resources in one resource group can freely communicate with and access resources located in other resource groups or subscriptions, provided network connectivity (e.g., VNet routing, peering, public endpoints) and appropriate access permissions allow it.

Statements	Yes	No
Azure resources can only access other resources in the same resource group.	○	○
If you delete a resource group, all the resources in the resource group will be deleted.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Resource groups define the lifecycle boundary for the assets they hold. Deleting a resource group issues a cascade deletion call through Azure Resource Manager (ARM), which permanently deletes every resource contained inside that resource group.

Answer:

Answer Area

Statements	Yes	No
Azure resources can only access other resources in the same resource group.	○	○
If you delete a resource group, all the resources in the resource group will be deleted.	○	○
A resource group can contain resources from multiple Azure regions.	○	○

Explanation:
Box 1: No -
A resource can interact with resources in other resource groups.

Box 2: Yes -
Deleting the resource group will remove the resource group as well as all the resources in that resource group. This can be useful for the management of resources. For example, a virtual machine has several components (the VM itself, virtual disks, network adapter etc.). By placing the VM in its own resource group, you can delete the VM along with all its associated components by deleting the resource group.
Another example is when creating a test environment. You could place the entire test environment (Network components, virtual machines etc.) in one resource group. You can then delete the entire test environment by deleting the resource group.

Box 3: Yes -
Resources from multiple different regions can be placed in a resource group. The resource group only contains metadata about the resources it contains.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-overview
https://www.codeisahighway.com/effective-ways-to-delete-resources-in-a-resource-group-on-azure/

Question: 160 CertyIQ

You plan to store 20 TB of data in Azure. The data will be accessed infrequently and visualized by using Microsoft Power BI.
You need to recommend a storage solution for the data.

Which two solutions should you recommend? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Azure Data Lake
B. Azure Cosmos DB
C. Azure SQL Data Warehouse
D. Azure SQL Database
E. Azure Database for PostgreSQL

Azure Data Lake (ADLS Gen2): Designed specifically for big data analytics, petabyte-scale storage, and cost-effective cold/infrequent access patterns. It provides native connectors directly into Microsoft Power BI (via the Azure Data Lake Storage connector or DirectQuery/Import), allowing large-scale reporting and reporting datasets without requiring full transactional database overhead.

Azure SQL Data Warehouse (Azure Synapse Analytics): Built on a Massively Parallel Processing (MPP) engine designed for large analytical workloads typically ranging from several terabytes to petabytes. It integrates seamlessly with Power BI and allows compute pausing/scaling when access is infrequent, significantly minimizing costs while retaining the 20 TB data volume.

Answer: AC

Explanation:

Azure SQL Data Warehouse is now Azure Synapse Analytics

You can use Power BI to analyze and visualize data stored in Azure Data Lake and Azure SQL Data Warehouse.

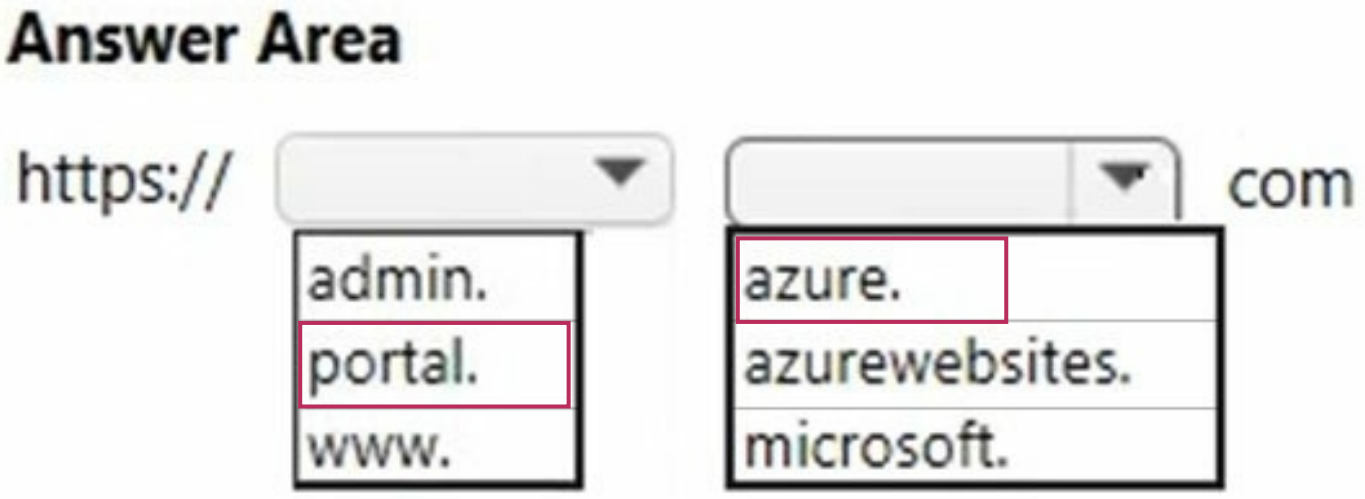

Azure Data Lake includes all of the capabilities required to make it easy for developers, data scientists and analysts to store data of any size and shape and at any speed, and do all types of processing and analytics across platforms and languages. It removes the complexities of ingesting and storing all your data while making it faster to get up and running with batch, streaming and interactive analytics. It also integrates seamlessly with operational stores and data warehouses so that you can extend current data applications.

References:

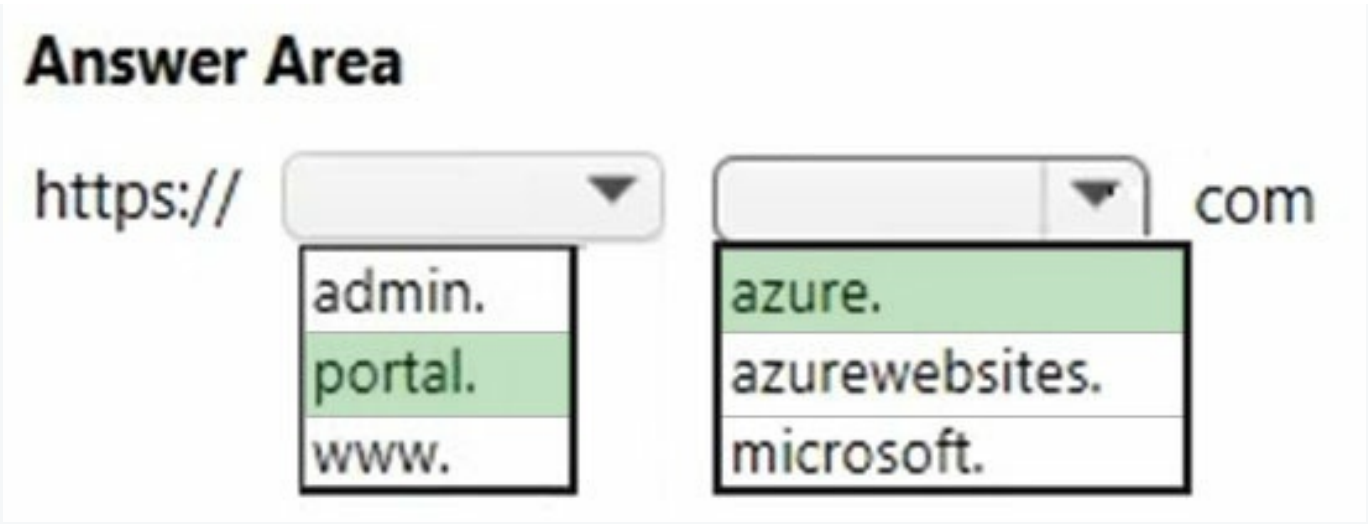

https://docs.microsoft.com/en-us/azure/data-lake-store/data-lake-store-power-bi
https://azure.microsoft.com/en-gb/solutions/data-lake/ https://docs.microsoft.com/en-us/azure/data-lake-store/data-lake-store-power-bi

Question: 161 CertyIQ

HOTSPOT -
You have an Azure environment that contains 10 web apps. To which URL should you connect to manage all the Azure resources? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer:

Explanation:

The Azure portal is a web-based management interface where you can view and manage all your Azure resources in one unified hub, including web apps, databases, virtual machines, virtual networks, storage and Visual Studio team projects.

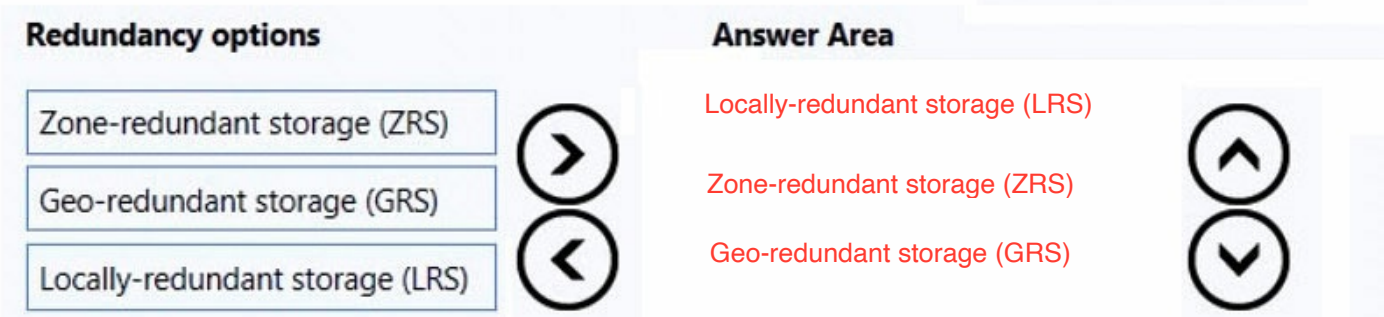

The URL of the Azure portal is https://portal.azure.com.

References:

https://azure.microsoft.com/en-gb/features/azure-portal/

Question: 162 CertyIQ

DRAG DROP -
Arrange the storage account redundancy options from the least redundant to the most redundant. To answer, move all options from the list of options to the answer area and arrange them in the correct order.
Select and Place:

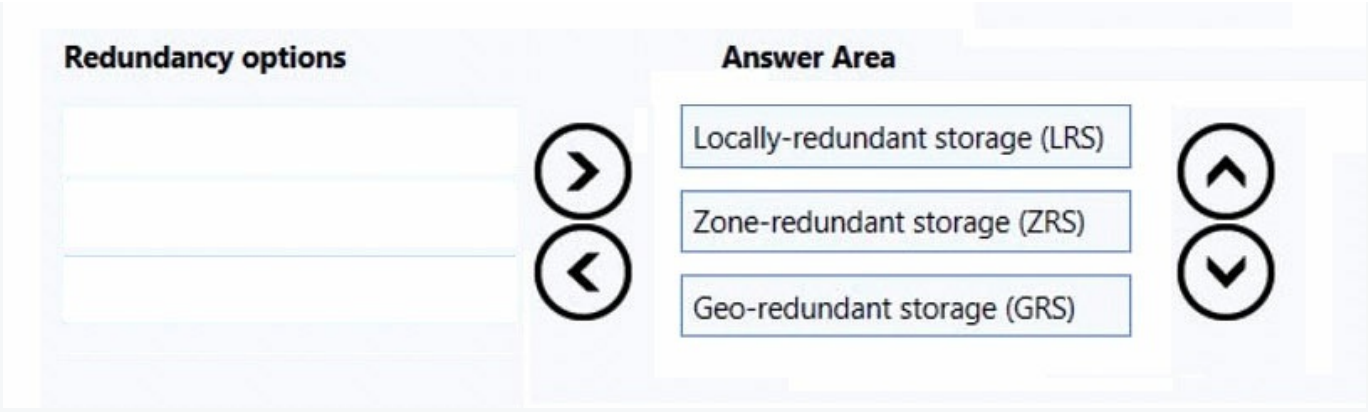

Answer:

Locally-redundant storage (LRS): Replicates data three times synchronously within a single physical datacenter in the primary region. It protects against standard hardware and disk drive failures, but a physical facility-wide catastrophe (fire, flooding, power outage) can result in data unavailability or loss. This is the baseline, least redundant option ($11 \text{ nines / } 99.999999999\%$ durability).

Zone-redundant storage (ZRS): Replicates data synchronously across three distinct Azure availability zones within the primary region. Each zone consists of one or more separate physical datacenters equipped with independent power, cooling, and networking. It withstands entire datacenter outages within the region ($12 \text{ nines / } 99.9999999999\%$ durability).

Geo-redundant storage (GRS): Protects against regional-scale disasters by combining primary region replication with cross-region replication. It synchronously copies data three times using LRS in the primary region, and then asynchronously replicates data to a secondary, paired region hundreds of miles away (where it is stored three times via LRS again, for a total of 6 copies). It provides cross-regional disaster recovery ($16 \text{ nines / } 99.99999999999999\%$ durability).

Explanation:

Locally-redundant storage (LRS)

Zone-redundant storage (ZRS)

Geo-redundant storage (GRS)

Question: 163 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure Blob Storage is a

- data store for queuing and reliably delivering messages between applications.
- file share that can be mapped as a network drive.
- key/attribute store for non-relational, structured data.
- storage service optimized for very large objects, such as video files and bitmaps.

Answer:

Answer Area

Azure Blob Storage is a

- data store for queuing and reliably delivering messages between applications.
- file share that can be mapped as a network drive.
- key/attribute store for non-relational, structured data.
- storage service optimized for very large objects, such as video files and bitmaps.

Explanation:

Azure Blob storage is mainly used for unstructured large files such as audio, video, images, backup files, etc

Question: 164 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs Linux and has the Azure CLI tools installed.
Does this meet the goal?

A. Yes
B. No

PowerShell scripts (.ps1) require the PowerShell runtime (PowerShell 7 / Core for cross-platform support) and the Azure PowerShell module (Az), not the Azure CLI (az).

While both PowerShell and Azure CLI can run on Linux, macOS, and Windows, Azure CLI commands are structured as bash-friendly commands (az group create ...), whereas Azure PowerShell uses cmdlet syntax (New-AzResourceGroup).

Answer: B

Explanation:

Having only Azure CLI installed on a Linux host does not satisfy the requirement to execute a script written in PowerShell.

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.
PowerShell can now be installed on Linux. However, the question states that the computer has Azure CLI tools, not PowerShell installed. Therefore, this solution does not meet the goal.

Reference:
https://docs.microsoft.com/en-us/powershell/scripting/components/ise/how-to-write-and-run-scripts-in-the-windows-powershell-ise?view=powershell-6

Question: 165 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs Chrome OS and uses Azure Cloud Shell.
Does this meet the goal?

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources.

A. Yes
B. No

Because Cloud Shell runs entirely in a web browser (e.g., Google Chrome), it is platform-agnostic and fully functional on Chrome OS, Windows, macOS, or Linux without requiring local tooling installation.

Answer: A

Explanation:

Azure Cloud Shell provides a choice between Bash and PowerShell. The PowerShell experience comes pre-installed with the latest Azure PowerShell (Az) module, git, and command-line utilities, allowing users to upload and execute PowerShell scripts directly against their Azure subscription.

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.
With the Azure Cloud Shell, you can run PowerShell cmdlets and scripts in a Web browser. You log in to the Azure Portal and select the Azure Cloud Shell option.
This will open a PowerShell session in the Web browser. The Azure Cloud Shell has the necessary Azure PowerShell module installed.
Note: to run a PowerShell script in the Azure Cloud Shell, you need to change to the directory where the PowerShell script is stored.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-shell/quickstart-powershell

Question: 166 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
From Azure Service Health, an administrator can view the health of all the services in an Azure environment.	○	○
From Azure Service Health, an administrator can create a rule to be alerted if an Azure service fails.	○	○
From Azure Service Health, an administrator can prevent a service failure	○	○

Answer:

Answer Area

Statements	Yes	No
From Azure Service Health, an administrator can view the health of all the services in an Azure environment.	○	○
From Azure Service Health, an administrator can create a rule to be alerted if an Azure service fails.	○	○
From Azure Service Health, an administrator can prevent a service failure	○	○

Explanation:
Box 1: Yes -
Azure Service Health consists of three components: Azure Status, Azure Service Heath and Azure Resource Health.
Azure service health provides a personalized view of the health of the Azure services and regions you're using. This is the best place to look for service impacting communications about outages, planned maintenance activities, and other health advisories because the authenticated Azure Service Health experience knows which services and resources you currently use.
To view the health of all other services available in Azure, you would use the Azure Status component of Azure Service Health. Azure status informs you of service outages in Azure on the Azure Status page. The page is a global view of the health of all Azure services across all Azure regions.

Box 2: Yes -
The best way to use Service Health is to set up Service Health alerts to notify you via your preferred communication channels when service issues, planned maintenance, or other changes may affect the Azure services and regions you use.

Box 3: No -

You can use Resource Health to view the health of a virtual machine. However, you cannot use Resource Health to prevent a service failure affecting the virtual machine.
Azure resource health provides information about the health of your individual cloud resources such as a specific virtual machine instance.

Reference:
https://docs.microsoft.com/en-us/azure/service-health/overview

Question: 167 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs macOS and has PowerShell Core 6.0 installed.
Does this meet the goal?

A. Yes
B. No

What Is Actually Required
PowerShell Engine (The Shell / Runtime):
Either Windows PowerShell 5.1 (built into Windows) or PowerShell Core (PowerShell 7+) on Windows, macOS, or Linux.

The Azure PowerShell Module (Az):
PowerShell out of the box only understands base operating system cmdlets (like Get-Process, Set-Item).

Answer: B

Explanation: It does not know what an Azure resource group or VM is until you install the Az module, which provides the Azure-specific cmdlets (Connect-AzAccount, New-AzResourceGroup, New-AzVM):
The computer has PowerShell Core 6.0, but it doesn't have the Azure CLI installed. There is no mention of that in the question. You need Azure PowerShell module in addition to PowerShell to run Azure commands, such as New-AzVM.

Therefore, the answer = B, No.

PowerShell Core 6.0 will not bring Azure Powershell module in default. Therefore you have to install azure PowerShell module after installing PowerShell Core 6.0 into Mac. This means you need PowerShell Core 6.0 on your Mac to run the cmdlets of Azure PowerShell module.

Mac has Bash and does not come with PowerShell which is for Windows Machines.

To install PowerShell for Mac

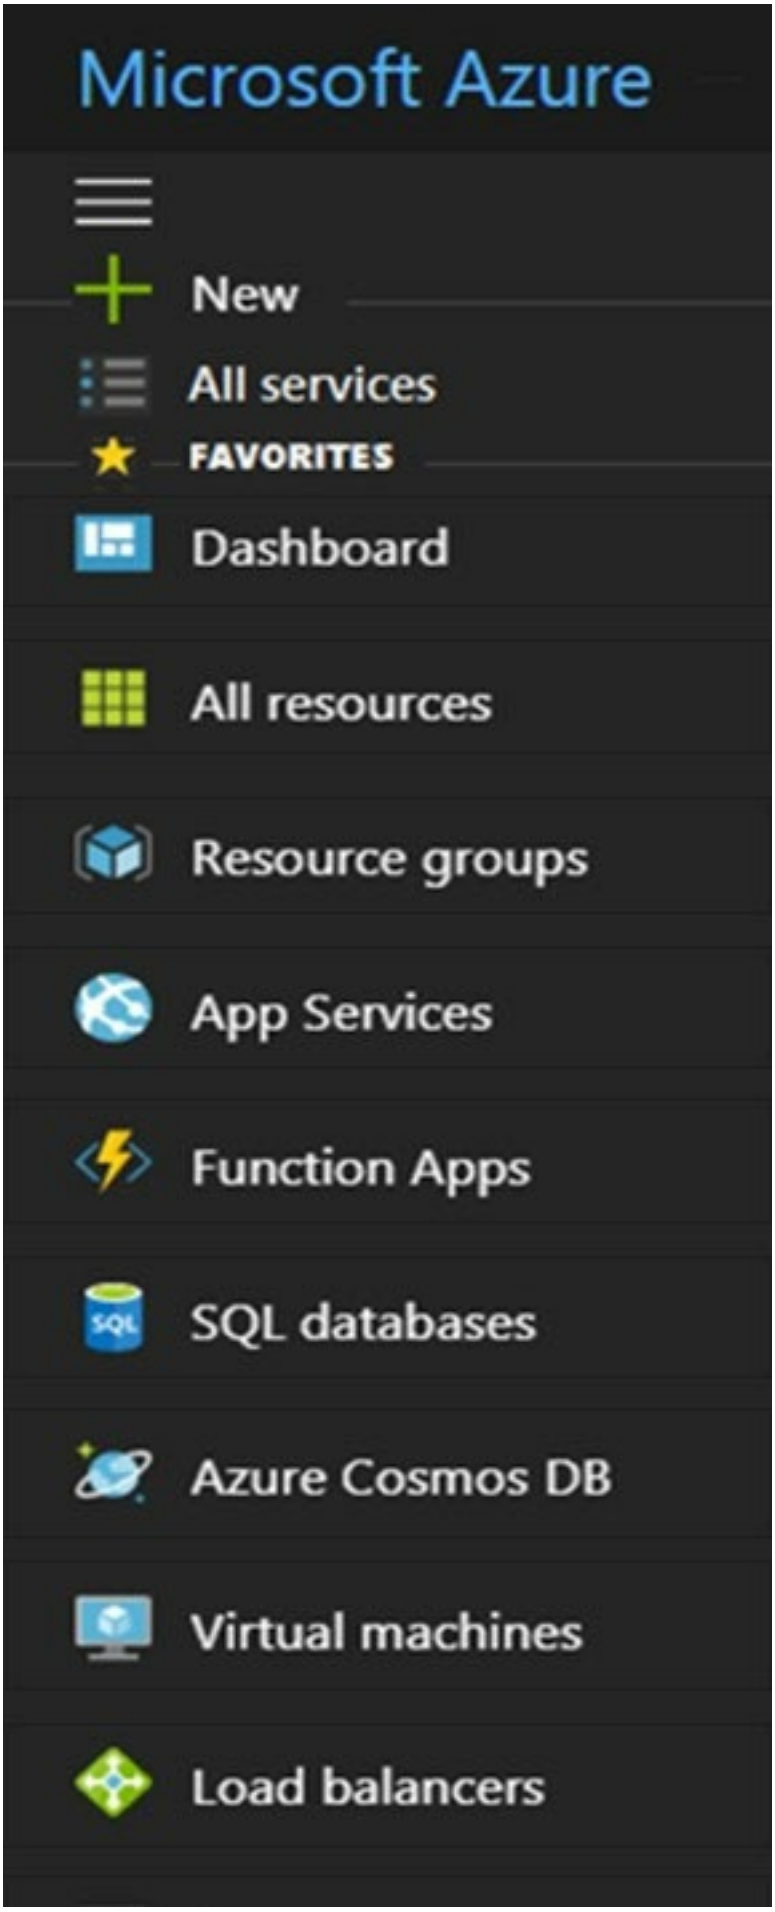

https://www.google.com/search?client=safari&rls=en&q=Install+Powershell+for+Mac&ie=UTF-8&oe=UTF-8

To install the Azure Az PowerShell module

https://learn.microsoft.com/en-us/powershell/azure/install-az-ps?view=azps-9.1.0

Question: 168 CertyIQ

HOTSPOT -
You need to view a list of planned maintenance events that can affect the availability of an Azure subscription.
Which blade should you use from the Azure portal? To answer, select the appropriate blade in the answer area.
Hot Area:

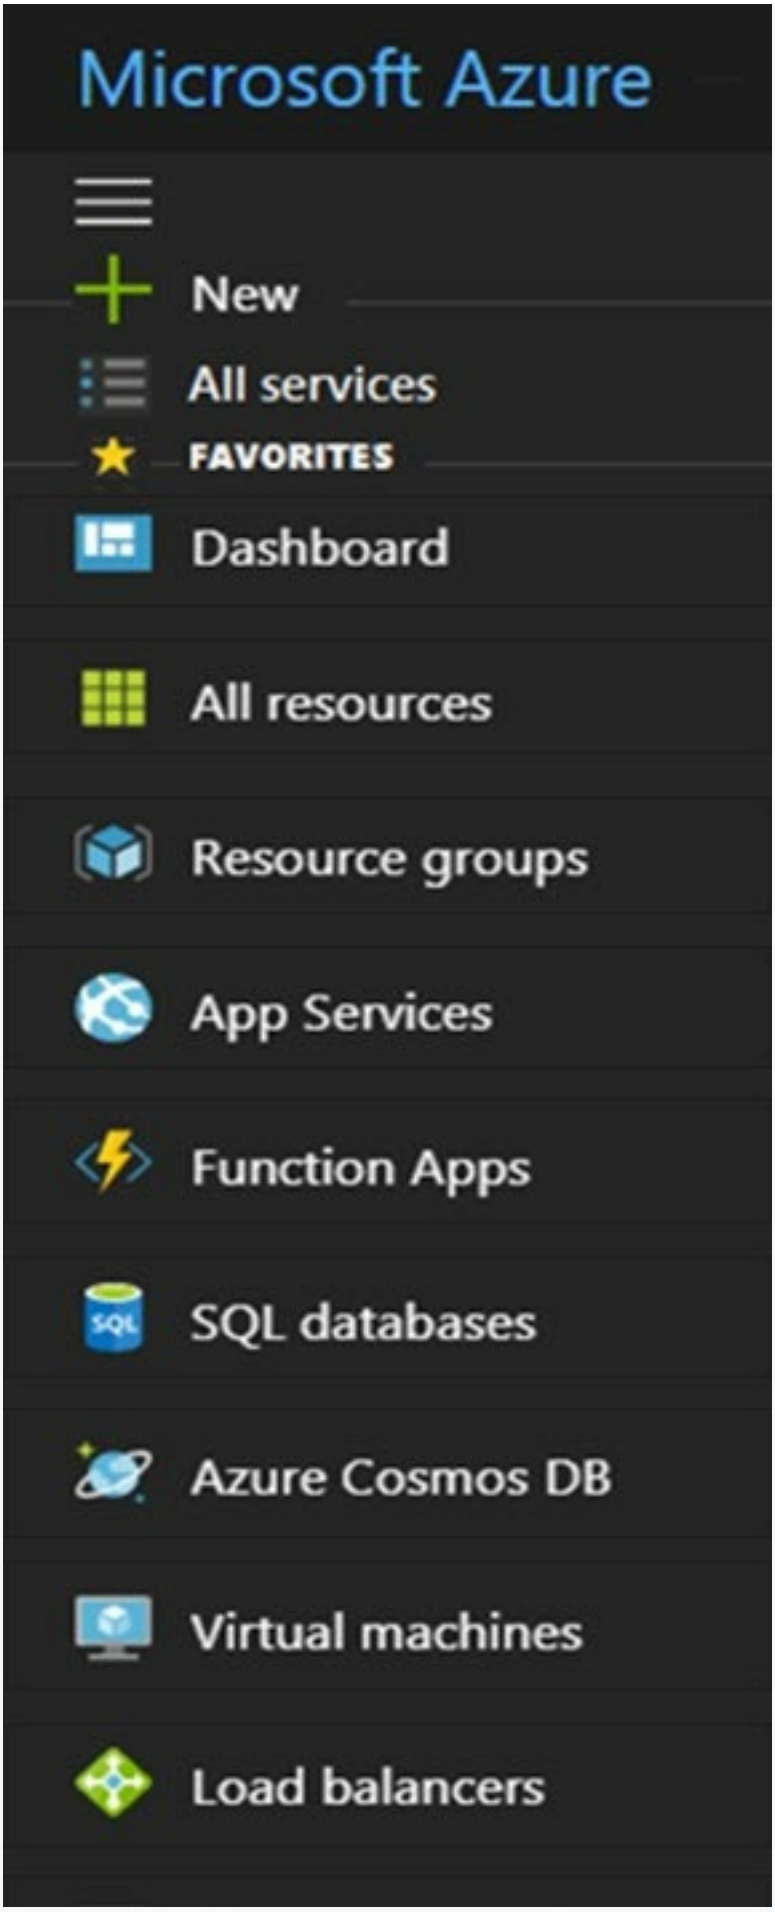

Help + support
(or Help + support / Service Health)

Azure Service Health provides a personalized view of the status and health of the Azure services, regions, and resources mapped to your specific subscriptions.

Within the Azure Service Health console, the Planned maintenance section lists upcoming maintenance events scheduled by Microsoft (e.g., host OS updates, hardware reboots, infrastructure patching) that may affect resource availability.

Answer:

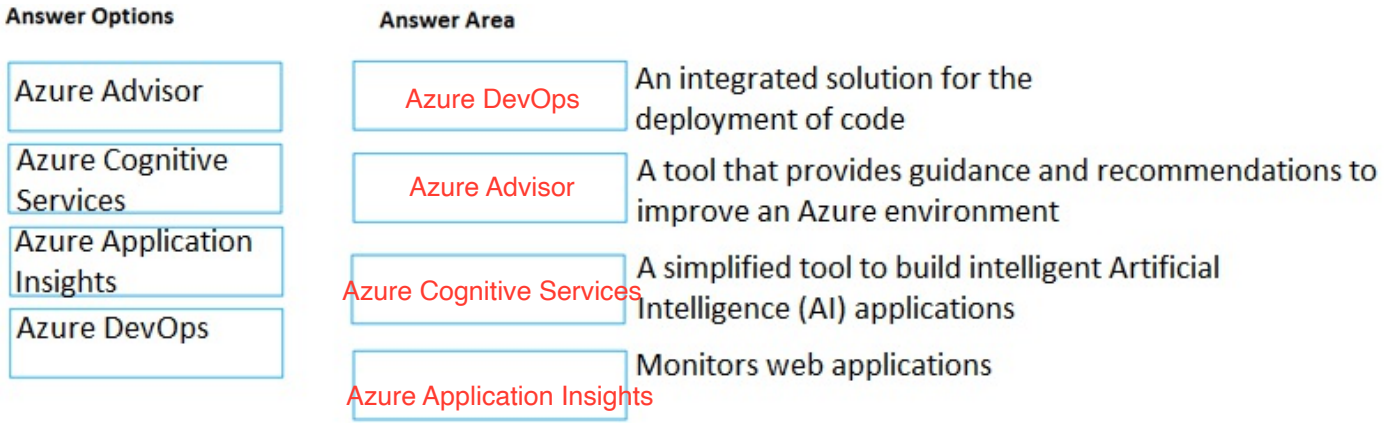

Explanation:

On the Help and Support blade, there is a Service Health option. If you click Service Health, a new blade opens. The Service Health blade contains the Planned

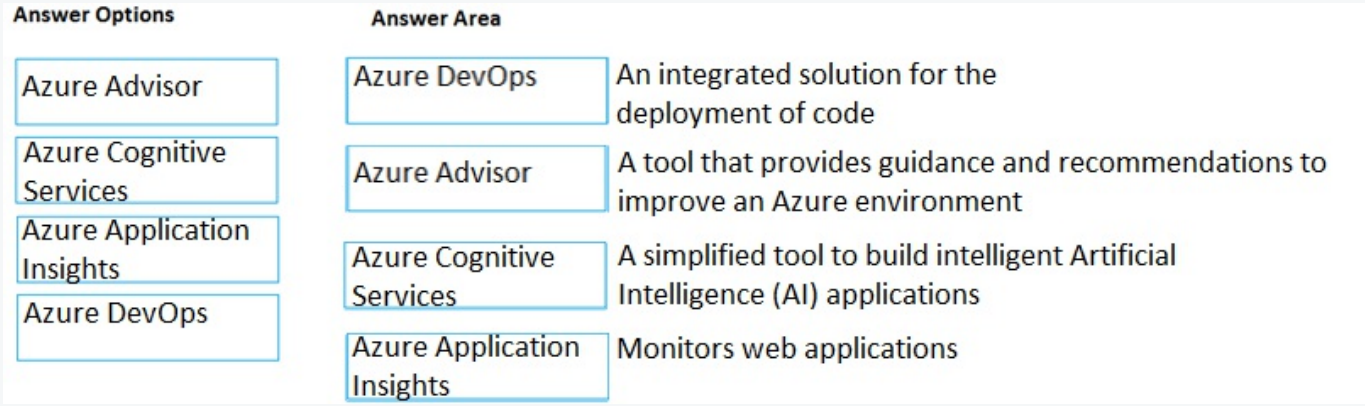

Maintenance link which opens a blade where you can view a list of planned maintenance events that can affect the availability of an Azure subscription.

Question: 169 CertyIQ

DRAG DROP -
Match the Azure service to the correct definition.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer:

Explanation:
Box 1: Azure DevOps.
Azure DevOps is Microsoft's primary software development and deployment platform.
DevOps influences the application lifecycle throughout its plan, develop, deliver and operate phases.
Box 2: Azure Advisor.
Advisor is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. It analyzes your resource configuration and usage telemetry and then recommends solutions that can help you improve the cost effectiveness, performance, high availability, and security of your Azure resources.
Box 3: Azure Cognitive Services.
Azure Cognitive Services are APIs, SDKs, and services available to help developers build intelligent applications without having direct AI or data science skills or knowledge. Azure Cognitive Services enable developers to easily add cognitive features into their applications. The goal of Azure Cognitive Services is to help developers create applications that can see, hear, speak, understand, and even begin to reason. The catalog of services within Azure Cognitive Services can be categorized into five main pillars - Vision, Speech, Language, Web Search, and Decision.
Box 4. Azure Application Insights.
Azure Application Insights detects and diagnoses anomalies in web apps.

Application Insights, a feature of Azure Monitor, is an extensible Application Performance Management (APM) service for developers and DevOps professionals.
Use it to monitor your live applications. It will automatically detect performance anomalies, and includes powerful analytics tools to help you diagnose issues and to understand what users actually do with your app.

Reference:
https://docs.microsoft.com/en-us/azure/azure-monitor/app/app-insights-overview
https://azure.microsoft.com/en-gb/overview/what-is-devops/ https://docs.microsoft.com/en-us/azure/advisor/advisor-overview https://docs.microsoft.com/en-us/azure/cognitive-services/welcome

Question: 170 CertyIQ

DRAG DROP -
Match the Azure service to the correct description.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer Options	Answer Area	
Azure HDInsight	Azure SQL Database	A managed relational cloud database service.
Azure Data Lake Analytics	Synapse Analytics	A cloud-based service that leverages massively parallel processing (MPP) to quickly run complex queries across petabytes of data in a relational database.
Azure SQL Synapse Analytics	Azure Data Lake Analytics	Can run massively parallel data transformation and processing programs across petabytes of data
Azure SQL Database	Azure HDInsight	An open-source framework for the distributed processing and analysis of big data sets in clusters

Answer:

Answer Options	Answer Area	
	Azure SQL Database	A managed relational cloud database service.
	Azure SQL Synapse Analytics	A cloud-based service that leverages massively parallel processing (MPP) to quickly run complex queries across petabytes of data in a relational database.
	Azure Data Lake Analytics	Can run massively parallel data transformation and processing programs across petabytes of data
	Azure HDInsight	An open-source framework for the distributed processing and analysis of big data sets in clusters

Explanation:

Clue:

Relational: Sql

Massive: Synapse

Massive PetaByte: Lake

Opensource: Insight

Box 1: Azure SQL Database -

SQL Server is a relational database service. Azure SQL Database is a managed SQL Server Database in Azure. The SQL Server is managed by Microsoft; you just have access to the database.

Box 2: Azure SQL Synapse Analytics

Azure SQL Synapse Analytics (previously called Data Warehouse) is a cloud-based Platform-as-a-Service (PaaS) offering from Microsoft. It is a large-scale, distributed, MPP (massively parallel processing) relational database technology in the same class of competitors as Amazon Redshift or Snowflake. Azure SQL

Synapse Analytics is an important component of the Modern Data Warehouse multi-platform architecture. Because Azure SQL Synapse Analytics is an MPP system with a shared-nothing architecture across distributions, it is meant for large-scale analytical workloads which can take advantage of parallelism.

Box 3: Azure Data Lake Analytics

You can process big data jobs in seconds with Azure Data Lake Analytics. You can process petabytes of data for diverse workload categories such as querying,

ETL, analytics, machine learning, machine translation, image processing and sentiment analysis by leveraging existing libraries written in .NET languages, R or

Python.

Box 4: Azure HDInsight.

Apache Hadoop was the original open-source framework for distributed processing and analysis of big data sets on clusters. The Hadoop ecosystem includes related software and utilities, including Apache Hive, Apache HBase, Spark, Kafka, and many others.

Azure HDInsight is a fully managed, full-spectrum, open-source analytics service in the cloud for enterprises. The Apache Hadoop cluster type in Azure HDInsight allows you to use HDFS, YARN resource management, and a simple MapReduce programming model to process and analyze batch data in parallel.

Reference:

https://azure.microsoft.com/en-us/services/sql-database/

https://docs.microsoft.com/en-us/azure/sql-data-warehouse/sql-data-warehouse-overview-what-is
https://docs.microsoft.com/bs-latn-ba/azure/hdinsight/hadoop/apache-hadoop-introduction
https://www.blue-granite.com/blog/is-azure-sql-data-warehouse-a-good-fit-updated
https://azure.microsoft.com/en-gb/services/data-lake-analytics/

Question: 171 CertyIQ

HOTSPOT -
You need to identify which blades in the Azure portal must be used to perform the following tasks:
- View security recommendations.
- Monitor the health of Azure services.
- Browse available virtual machine images.

Which blade should you identify for each task? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Monitor the health of Azure services:

- Monitor
- Subscriptions
- Marketplace
- Advisor

Browse available virtual machine images:

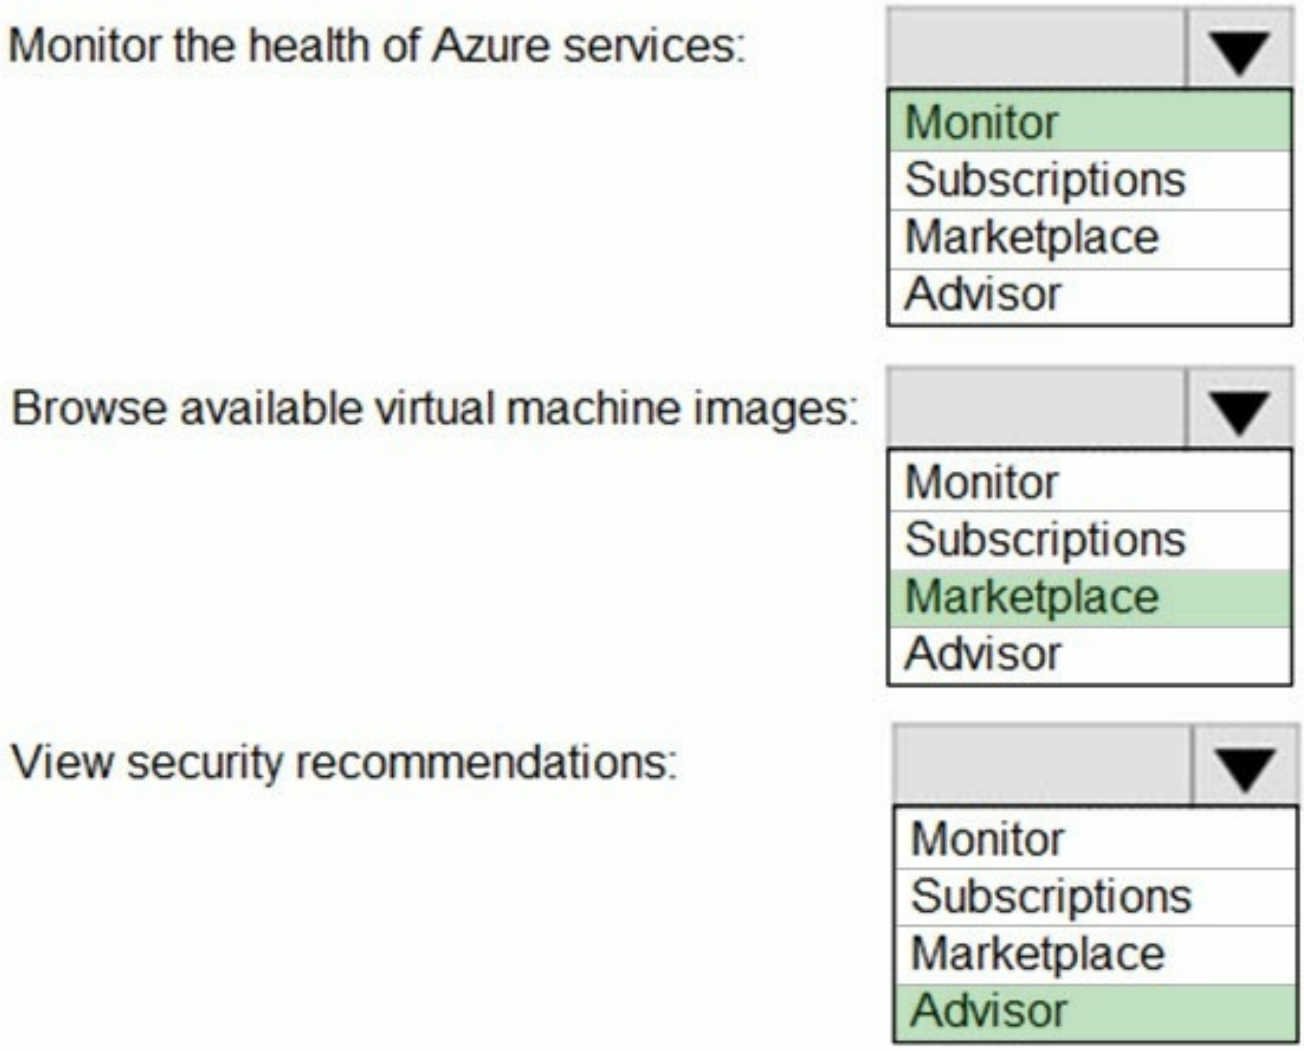

- Monitor
- Subscriptions
- Marketplace
- Advisor

View security recommendations:

- Monitor
- Subscriptions
- Marketplace
- Advisor

Answer:

Answer Area

Explanation:

Box 1:

Azure Monitor is used to monitor the health of Azure services.

Azure Monitor maximizes the availability and performance of your applications and services by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments. It helps you understand how your applications are performing and proactively identifies issues affecting them and the resources they depend on.

Box 2:

You can browse available virtual machine images in the Azure Marketplace.

Azure Marketplace provides access and information on solutions and services available from Microsoft and their partners. Customers can discover, try, or buy cloud software solutions built on or for Azure. The catalog of 8,000+ listings provides Azure building blocks, such as Virtual Machines (VMs), APIs, Azure apps, Solution Templates and managed applications, SaaS apps, containers, and consulting services.

Box 3.

Azure Advisor displays security recommendations.

Azure Advisor provides you with a consistent, consolidated view of recommendations for all your Azure resources. It integrates with Azure Security Center to bring you security recommendations. You can get security recommendations from the Security tab on the Advisor dashboard.

Security Center helps you prevent, detect, and respond to threats with increased visibility into and control over the security of your Azure resources. It periodically analyzes the security state of your Azure resources. When Security Center identifies potential security vulnerabilities, it creates recommendations. The

recommendations guide you through the process of configuring the controls you need.

Reference:
https://docs.microsoft.com/en-us/azure/azure-monitor/overview https://docs.microsoft.com/en-us/azure/marketplace/marketplace-faq-publisher-guide https://docs.microsoft.com/en-us/azure/advisor/advisor-security-recommendations

Question: 172 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use Bash in Azure Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
With Azure Cloud Shell, you can create virtual machines using Bash or PowerShell.
Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-shell/quickstart https://docs.microsoft.com/en-us/azure/cloud-shell/overview

Question: 173 CertyIQ

You have an on-premises application that sends email notifications automatically based on a rule.
You plan to migrate the application to Azure.
You need to recommend a serverless computing solution for the application.
What should you include in the recommendation?

A. a web app
B. a server image in Azure Marketplace
C. a logic app
D. an API app

Answer:

C

Explanation:

Azure Logic Apps is a cloud service that helps you schedule, automate, and orchestrate tasks, business processes, and workflows when you need to integrate apps, data, systems, and services across enterprises or organizations. Logic Apps simplifies how you design and build scalable solutions for app integration, data integration, system integration, enterprise application integration (EAI), and business-to-business (B2B) communication, whether in the cloud, on premises, or both.

For example, here are just a few workloads you can automate with logic apps:

- Process and route orders across on-premises systems and cloud services.
- Send email notifications with Office 365 when events happen in various systems, apps, and services.
- Move uploaded files from an SFTP or FTP server to Azure Storage.
- Monitor tweets for a specific subject, analyze the sentiment, and create alerts or tasks for items that need review.

References:

https://docs.microsoft.com/en-us/azure/logic-apps/logic-apps-overview

Question: 174 CertyIQ

You plan to deploy a website to Azure. The website will be accessed by users worldwide and will host large video files.
You need to recommend which Azure feature must be used to provide the best video playback experience.
What should you recommend?

A. an application gateway
B. an Azure ExpressRoute circuit
C. a content delivery network (CDN)
D. an Azure Traffic Manager profile

Answer: C

Explanation:
The question states that users are located worldwide and will be downloading large video files. The video playback experience would be improved if they can download the video from servers in the same region as the users. We can achieve this by using a content deliver network.
A content delivery network (CDN) is a distributed network of servers that can efficiently deliver web content to users. CDNs store cached content on edge servers in point-of-presence (POP) locations that are close to end users, to minimize latency.
Azure Content Delivery Network (CDN) offers developers a global solution for rapidly delivering high-bandwidth content to users by caching their content at strategically placed physical nodes across the world. Azure CDN can also accelerate dynamic content, which cannot be cached, by leveraging various network optimizations using CDN POPs. For example, route optimization to bypass Border Gateway Protocol (BGP).
The benefits of using Azure CDN to deliver web site assets include:
- Better performance and improved user experience for end users, especially when using applications in which multiple round-trips are required to load content.
- Large scaling to better handle instantaneous high loads, such as the start of a product launch event.
- Distribution of user requests and serving of content directly from edge servers so that less traffic is sent to the origin server.

Reference:
https://docs.microsoft.com/en-us/azure/cdn/cdn-overview

Question: 175 CertyIQ

Your company plans to deploy several million sensors that will upload data to Azure.
You need to identify which Azure resources must be created to support the planned solution.
Which two Azure resources should you identify? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Azure Data Lake
B. Azure Queue storage
C. Azure File Storage
D. Azure IoT Hub
E. Azure Notification Hubs

Answer: AD

Explanation:
IoT Hub (Internet of things Hub) provides data from millions of sensors.
IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.
There are two storage services IoT Hub can route messages to -- Azure Blob Storage and Azure Data Lake Storage Gen2 (ADLS Gen2) accounts. Azure Data
Lake Storage accounts are hierarchical namespace-enabled storage accounts built on top of blob storage. Both of these use blobs for their storage.

Reference:
https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub
https://docs.microsoft.com/en-us/azure/iot-hub/iot-hub-devguide-messages-d2c

Question: 176 CertyIQ

You have an Azure web app.
You need to manage the settings of the web app from an iPhone.
What are two Azure management tools that you can use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Azure CLI
B. the Azure portal
C. Azure Cloud Shell
D. Windows PowerShell
E. Azure Storage Explorer

Answer: BC

Explanation:
The Azure portal is the web-based portal for managing Azure. Being web-based, you can use the Azure portal

on an iPhone.
Azure Cloud Shell is a web-based command line for managing Azure. You access the Azure Cloud Shell from the Azure portal. Being web-based, you can use the
Azure Cloud Shell on an iPhone.
Incorrect Answers:
A: Azure CLI can be installed on MacOS but it cannot be installed on an iPhone.
D: Windows PowerShell can be installed on MacOS but it cannot be installed on an iPhone.
E: Azure Storage Explorer is not used to manage Azure web apps.

Reference:
http://www.deployazure.com/management/managing-azure-from-ipad/

Question: 177 CertyIQ

Your company plans to deploy an Artificial Intelligence (AI) solution in Azure.
What should the company use to build, test, and deploy predictive analytics solutions?

A. Azure Logic Apps
B. Azure Machine Learning Designer
C. Azure Batch
D. Azure Cosmos DB

Answer: B

Explanation:

Azure Machine Learning designer lets you visually connect datasets and modules on an interactive canvas to create machine learning models.

Reference:

https://docs.microsoft.com/en-us/azure/machine-learning/concept-designer

Question: 178 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (No): Azure Advisor acts as a proactive architectural guidance engine across Reliability (High Availability), Security, Performance, Operational Excellence, and Cost. It generates a list of virtual machines that are not backed up (recommending you enable Azure Backup to protect them). To see the inventory of VMs that are already protected, you navigate to Azure Backup Center or the specific Recovery Services Vault / Backup Vault, not Azure Advisor.

Statement 2 (No): Secure Score (calculated by Microsoft Defender for Cloud and surfaced via Azure Advisor) measures your organization's security posture. When you implement security recommendations (such as enabling MFA, encrypting disks, or installing endpoint protection), vulnerabilities are closed and your Secure Score increases, not decreases.

Statement 3 (No): Azure Advisor recommendations are entirely advisory and optional best-practice guidance. Microsoft Support agreements (Developer, Standard, Professional Direct, or Premier/Unified) are governed by paid support plan contracts and service terms; they are never revoked or penalized if you choose not to implement Advisor recommendations.

Answer Area

Statements	Yes	No
Azure Advisor can generate a list of Azure virtual machines that are protected by Azure Backup.	○	○
If you implement the security recommendations provided by Azure Advisor, your company's secure score will decrease.	○	○
To maintain Microsoft support, you must implement the security recommendations provided by Azure Advisor within a period of 30 days.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Advisor can generate a list of Azure virtual machines that are protected by Azure Backup.	○	○
If you implement the security recommendations provided by Azure Advisor, your company's secure score will decrease.	○	○
To maintain Microsoft support, you must implement the security recommendations provided by Azure Advisor within a period of 30 days.	○	○

Explanation:

Box 1: No -

Azure Advisor does not generate a list of virtual machines that ARE protected by Azure Backup. Azure Advisor does however, generate a list of virtual that ARE
NOT protected by Azure Backup. You can view a list of virtual machines that are protected by Azure Backup by viewing the Protected Items in the Azure Recovery
Services Vault.

Box 2: No -

If you implement the security recommendations, you company's score will increase, not decrease.

Box 3: No -
There is no requirement to implement the security recommendations provided by Azure Advisor. The recommendations are just that, 'recommendations'. They are not 'requirements'.

Reference:
https://azure.microsoft.com/en-gb/blog/advisor-backup-recommendations/ https://docs.microsoft.com/en-us/azure/advisor/advisor-overview https://microsoft.github.io/AzureTipsAndTricks/blog/tip173.html

Question: 179 CertyIQ

What can you use to automatically send an alert if an administrator stops an Azure virtual machine?

A. Azure Advisor
B. Azure Service Health
C. Azure Monitor
D. Azure Network Watcher

Azure Monitor centralizes monitoring and alerting across all Azure resources.

When an administrator performs an operational or management action—such as stopping or deallocating a virtual machine (Microsoft.Compute/virtualMachines/powerOff/action or deallocate/action)—that management event is recorded in the Azure Activity Log.

Answer: C

Explanation:

Azure Monitor Alert Rules (specifically Activity Log Alerts) can be configured to listen for these administrative operations and automatically trigger notifications via an Action Group (sending emails, SMS, push alerts, or webhooks) the moment the action occurs.

Azure Monitor is correct answer.

Azure Service Health provides the health/status of Azure service.

Azure Monitor - Provides Health/Status of your application using insights and logs

Reference:

https://docs.microsoft.com/en-us/azure/azure-monitor/insights/vminsights-alerts

Question: 180 CertyIQ

DRAG DROP -
Match the Azure services to the correct descriptions.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point
Select and Place:

Azure Services

- Azure Machine Learning
- Azure Synapse Analytics
- Azure IoT Hub
- Azure Functions

Answer Area

Synapse Analytics	Provides a cloud-based Enterprise Data Warehouse (EDW).
Azure Machine Learning	Uses past trainings to provide predictions that have high probability.
Azure Functions	Provides serverless computing functionalities.
Azure IoT Hub	Processes data from millions of sensors.

Answer:

Azure Services	Answer Area	
	Azure Synapse Analytics	Provides a cloud-based Enterprise Data Warehouse (EDW).
	Azure Machine Learning	Uses past trainings to provide predictions that have high probability.
	Azure Functions	Provides serverless computing functionalities.
	Azure IoT Hub	Processes data from millions of sensors.

Explanation:

Box 1: Azure SQL Synapse Analytics

Azure SQL Synapse Analytics (previously called Data Warehouse) is a cloud-based Platform-as-a-Service (PaaS) offering from Microsoft. It is a large-scale, distributed, MPP (massively parallel processing) relational database technology in the same class of competitors as Amazon Redshift or Snowflake. Azure SQL Synapse Analytics is an important component of the Modern Data Warehouse multi-platform architecture. Because Azure SQL Synapse Analytics is an MPP system with a shared-nothing architecture across distributions, it is meant for large-scale analytical workloads which can take advantage of parallelism.

Box 2:

Azure Machine Learning uses past trainings to provide predictions that have high probability.

Machine learning is a data science technique that allows computers to use existing data to forecast future behaviors, outcomes, and trends. By using machine learning, computers learn without being explicitly programmed.

Forecasts or predictions from machine learning can make apps and devices smarter. For example, when you shop online, machine learning helps recommend other products you might want based on what you've bought.

Box 3:

Azure Functions provides serverless computing functionalities.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Box 4:

IoT Hub (Internet of things Hub) provides data from millions of sensors.

IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.

Reference:

https://azure.microsoft.com/en-gb/services/synapse-analytics/ https://docs.microsoft.com/en-us/azure/machine-learning/overview-what-is-azure-ml https://docs.microsoft.com/en-us/azure/iot-hub/about-iot-hub https://docs.microsoft.com/en-us/azure/azure-functions/functions-overview

Question: 181 CertyIQ

You have an Azure environment.

You need to create a new Azure virtual machine from a tablet that runs the Android operating system.

What are three possible solutions? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

A. Use Bash in Azure Cloud Shell.

B. Use PowerShell in Azure Cloud Shell.

C. Use the PowerApps portal.

D. Use the Security & Compliance admin center.

E. Use the Azure portal.

Answer: ABE

Explanation:
The Android tablet device will have a web browser (Chrome). That's enough to connect to the Azure portal.
The Azure portal offers three ways to create a VM:
- Using the graphical portal.
- Using the Azure Cloud Shell using Bash.
- Using the Azure Cloud Shell using PowerShell.

Question: 182 CertyIQ

A team of developers at your company plans to deploy, and then remove, 50 virtual machines each week. All the virtual machines are configured by using Azure Resource Manager templates.
You need to recommend which Azure service will minimize the administrative effort required to deploy and remove the virtual machines.
What should you recommend?

A. Azure Reserved Virtual Machine (VM) Instances
B. Azure DevTest Labs
C. Azure virtual machine scale sets
D. Azure Virtual Desktop

Answer: B

Explanation:
DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates.
By using DevTest Labs, you can test the latest versions of your applications by doing the following tasks:
- Quickly provision Windows and Linux environments by using reusable templates and artifacts.
- Easily integrate your deployment pipeline with DevTest Labs to provision on-demand environments.
- Scale up your load testing by provisioning multiple test agents and create pre-provisioned environments for training and demos.

Reference:
https://docs.microsoft.com/en-us/azure/lab-services/devtest-lab-overview

Question: 183 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:
Statement 1 (No): Azure Advisor provides recommendations for Azure subscription-level resources (e.g., VMs, storage, SQL databases, App Services) across five categories: Cost, Security, Reliability, Performance, and Operational Excellence. It does not evaluate tenant-level identity directory configurations (such as user accounts, conditional access, and password policies for Azure AD / Microsoft Entra ID). Identity and directory security recommendations are provided by Microsoft Entra Identity Protection and Microsoft Entra Secure Score.

Statement 3 (No): Azure Advisor provides performance, reliability, and security recommendations (e.g., applying NSG rules or restricting public endpoints via Defender for Cloud recommendations), but it does not act as a general network configuration wizard or recommend general network settings (e.g., configuring private IP addresses, DNS servers, routing tables) for virtual machines.

Answer Area

Statements	Yes	No
Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment.	○	○
Azure Advisor provides recommendations on how to reduce the cost of running Azure virtual machines.	○	○
Azure Advisor provides recommendations on how to configure the network settings on Azure virtual machines.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Advisor provides recommendations on how to improve the security of an Azure Active Directory (Azure AD) environment.	○	○
Azure Advisor provides recommendations on how to reduce the cost of running Azure virtual machines.	○	○
Azure Advisor provides recommendations on how to configure the network settings on Azure virtual machines.	○	○

Explanation:

Box 1: No -

Azure Advisor provides you with a consistent, consolidated view of recommendations for all your Azure resources. It integrates with Azure Security Center to bring you security recommendations. You can get security recommendations from the Security tab on the Advisor dashboard. Examples of recommendations include restricting access to virtual machines by configuring Network Security Groups, enabling storage encryption, installing vulnerability assessment solutions.
However, Azure Advisor does not provide recommendations on how to improve the security of an Azure AD environment.

Box 2: Yes -
Advisor helps you optimize and reduce your overall Azure spend by identifying idle and underutilized resources. You can get cost recommendations from the Cost tab on the Advisor dashboard.
Box 3: No.
Azure Advisor does not provide recommendations on how to configure network settings on Azure virtual machines.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-security-recommendations
https://docs.microsoft.com/en-us/azure/advisor/advisor-cost-recommendations

Question: 184 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From the Azure portal, launch Azure Cloud Shell and select PowerShell. Run the command in Cloud Shell.
Does this meet the goal?

A. Yes
B. No

The provided command (az vm create ...) is an Azure CLI command.

Azure Cloud Shell comes with both Azure CLI and Azure PowerShell pre-installed and authenticated by default.

Answer: A

Explanation:

In Azure Cloud Shell, whether you select the Bash or the PowerShell environment, the underlying host container supports executing external CLI binaries. The az executable is directly accessible in the PATH of the PowerShell Cloud Shell environment, meaning Azure CLI commands run without issue inside Cloud Shell's PowerShell session.

The command can be run in the Azure Cloud Shell. Although this question says you select PowerShell rather than Bash, the Az commands will work in

PowerShell.

The Azure Cloud Shell is a free interactive shell. It has common Azure tools preinstalled and configured to use with your account.

To open the Cloud Shell, just select Try it from the upper right corner of a code block. You can also launch Cloud Shell in a separate browser tab by going to https://shell.azure.com/bash.

Reference:

https://docs.microsoft.com/en-us/azure/virtual-machines/linux/quick-create-cli

Question: 185 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS
--generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From a computer that runs Windows 10, install Azure CLI. From PowerShell, sign in to Azure and then run the command.
Does this meet the goal?

A. Yes
B. No

The Azure CLI (az) is a cross-platform command-line executable that can be installed on Windows (including Windows 10), macOS, and Linux.

When installed on Windows, the az executable is added to the system PATH. Any command shell—including PowerShell or Command Prompt (cmd.exe)—can launch and execute az commands directly.

Answer: A

Explanation:
Signing in to Azure from PowerShell using the Azure CLI (az login) sets the active subscription context to Subscription1 (or allows selecting it). Executing the command from that session successfully provisions VM1 in RG1 within Subscription1
The command can be run from PowerShell or the command prompt if you have the Azure CLI installed.

Reference:
https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-windows?view=azure-cli-latest

Question: 186 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS
--generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From a computer that runs Windows 10, install Azure CLI. From a command prompt, sign in to Azure and then run the command.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
The command can be run from PowerShell or the command prompt if you have the Azure CLI installed.

Reference:
https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-windows?view=azure-cli-latest

Question: 187 CertyIQ

HOTSPOT -
Several support engineers plan to manage Azure by using the computers shown in the following table:

Name	Operating system
Computer1	Windows 10
Computer2	Ubuntu
Computer3	MacOS Mojave

You need to identify which Azure management tools can be used from each computer.
What should you identify for each computer? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Computer1:

The Azure CLI and the Azure portal
The Azure portal and Azure PowerShell
The Azure CLI and Azure PowerShell
The Azure CLI, the Azure portal, and Azure PowerShell

Computer2:

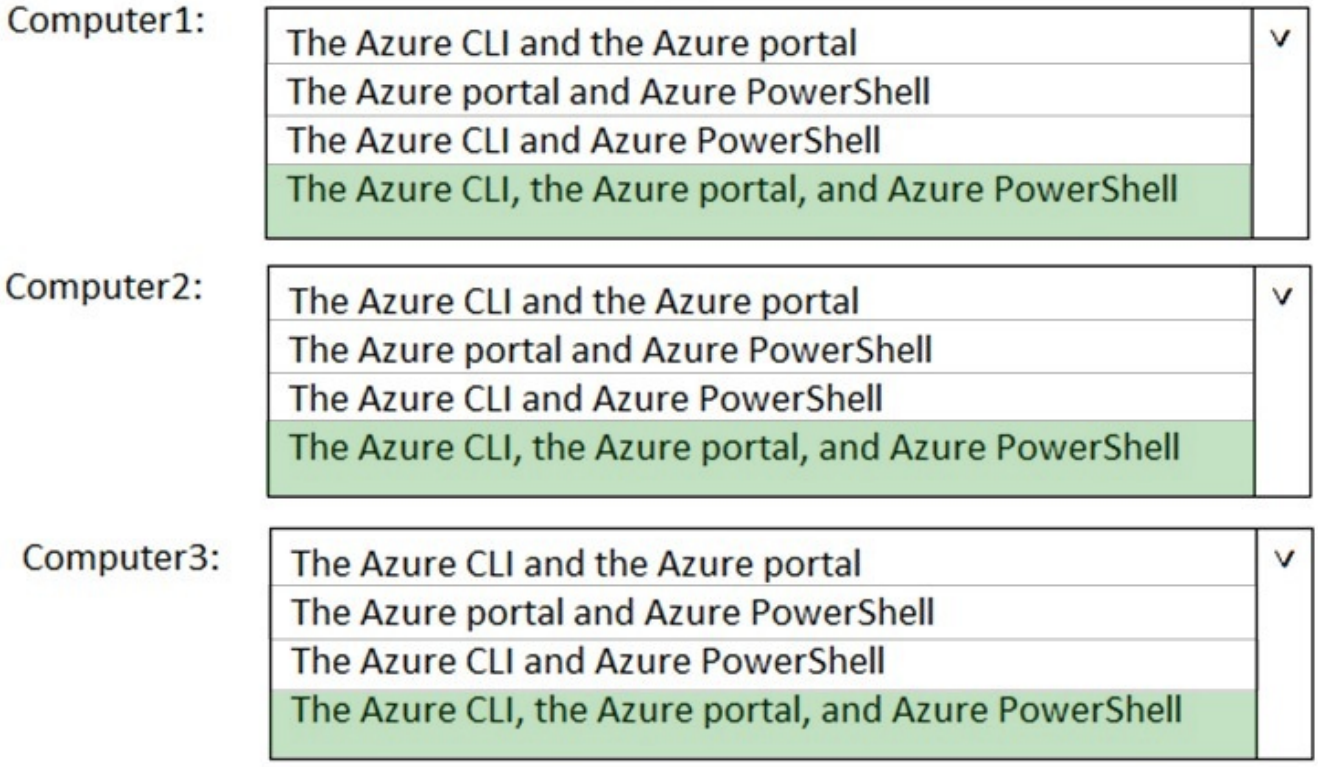

The Azure CLI and the Azure portal
The Azure portal and Azure PowerShell
The Azure CLI and Azure PowerShell
The Azure CLI, the Azure portal, and Azure PowerShell

Computer3:

The Azure CLI and the Azure portal
The Azure portal and Azure PowerShell
The Azure CLI and Azure PowerShell
The Azure CLI, the Azure portal, and Azure PowerShell

Answer:

Answer Area

Explanation:
Previously, the Azure CLI (or x-plat CLI) was the only option for managing Azure subscriptions and resources from the command-line on Linux and macOS. Now with the open source and cross-platform release of PowerShell, you'll be able to manage all your Azure resources from Windows, Linux and macOS using your tool of choice, either the Azure CLI or Azure PowerShell cmdlets.
The Azure portal runs in a web browser so can be used in either operating system.

Question: 188

CertyIQ

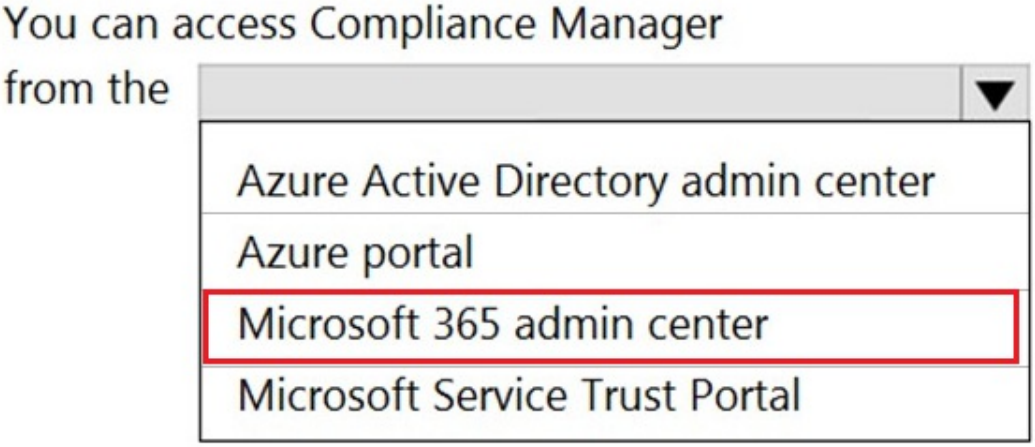

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:

Microsoft 365 Admin Center.

"Compliance Manager has moved from the Service Trust Portal to its new location in the Microsoft 365 compliance center. All customer data has been moved over to the new location, so you can continue using Compliance Manager without interruption. Refer to the Compliance Manager documentation for setup information and to learn about new features. Although the classic version of Compliance Manager remains in the Service Trust Portal, all users are encouraged to use Compliance Manager in the Microsoft 365 compliance center."

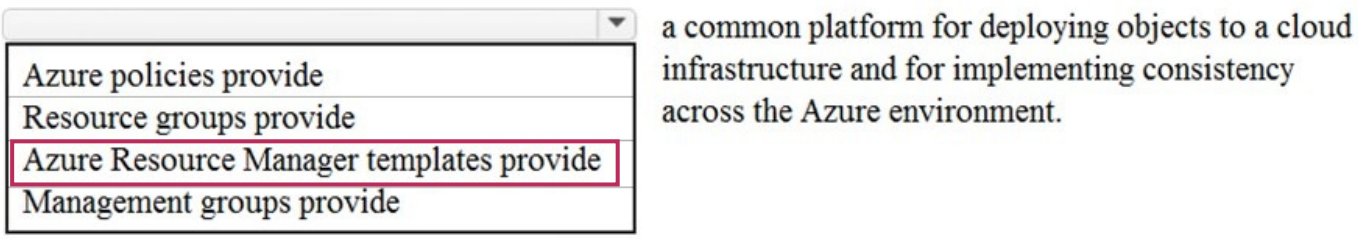

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

Question: 189 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Answer:

Answer Area

Azure policies provide Resource groups provide Azure Resource Manager templates provide Management groups provide	a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the Azure environment.

Explanation:

Azure Resource Manager templates provides a common platform for deploying objects to a cloud infrastructure and for implementing consistency across the
Azure environment.

Azure policies are used to define rules for what can be deployed and how it should be deployed. Whilst this can help in ensuring consistency, Azure policies do not provide the common platform for deploying objects to a cloud infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 190 CertyIQ

DRAG DROP -
Match the Azure service to the correct description.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:

Answer Options	Answer Area	
Azure Machine Learning	Bot Services	Provides a digital online assistant that provides speech support
Azure IoT Hub	Machine Learning	Uses past trainings to provide predictions that have high probability
Azure Bot Services	Azure Functions	Provides serverless computing functionalities
Azure Functions	IoT Hub	Processes data from millions of sensors

Answer:

Answer Options	Answer Area	
Azure Machine Learning	Azure Bot Services	Provides a digital online assistant that provides speech support
Azure IoT Hub	Azure Machine Learning	Uses past trainings to provide predictions that have high probability
Azure Bot Services	Azure Functions	Provides serverless computing functionalities
Azure Functions	Azure IoT Hub	Processes data from millions of sensors

Explanation:

Box 1:
Azure Bot Services provides a digital online assistant that provides speech support.
Bots provide an experience that feels less like using a computer and more like dealing with a person - or at least an intelligent robot. They can be used to shift simple, repetitive tasks, such as taking a dinner reservation or gathering profile information, on to automated systems that may no longer require direct human intervention. Users converse with a bot using text, interactive cards, and speech. A bot interaction can be a quick question and answer, or it can be a sophisticated conversation that intelligently provides access to services.
Box 2:
Azure Machine Learning uses past trainings to provide predictions that have high probability.
Machine learning is a data science technique that allows computers to use existing data to forecast future behaviors, outcomes, and trends. By using machine learning, computers learn without being explicitly programmed.
Forecasts or predictions from machine learning can make apps and devices smarter. For example, when you shop online, machine learning helps recommend other products you might want based on what you've bought.
Box 3:
Azure Functions provides serverless computing functionalities.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.
Box 4:
IoT Hub (Internet of things Hub) provides data from millions of sensors.
IoT Hub is a managed service, hosted in the cloud, that acts as a central message hub for bi-directional communication between your IoT application and the devices it manages. You can use Azure IoT Hub to build IoT solutions with reliable and secure communications between millions of IoT devices and a cloud- hosted solution backend. You can connect virtually any device to IoT Hub.

Question: 191 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Solution: Run the script from a computer that runs Windows 10 and has the Azure PowerShell module installed.
Does this meet the goal?

A. Yes
B. No

Answer:

A

Explanation:

A PowerShell script is a file that contains PowerShell cmdlets and code. A PowerShell script needs to be run in PowerShell.

In this question, the computer has the Azure PowerShell module installed. Therefore, this solution does meet the goal.

References:

https://docs.microsoft.com/en-us/powershell/scripting/components/ise/how-to-write-and-run-scripts-in-the-windows-powershell-ise?view=powershell-6

Question: 192 CertyIQ

DRAG DROP -
Match the Azure services to the correct description.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:

Services	Answer Area	
Azure Functions	Virtual Machines	Provide operating system virtualization
Azure App Service	Container Instances	Provide portable environment for virtualized applications
Azure virtual machines	App Service	Used to build, deploy, and scale web apps
Azure Container Instances	Azure Functions	Provide a platform for serverless code

Answer:

Services	Answer Area	
	Azure virtual machines	Provide operating system virtualization
	Azure Container Instances	Provide portable environment for virtualized applications
	Azure App Service	Used to build, deploy, and scale web apps
	Azure Functions	Provide a platform for serverless code

Explanation:
Box 1:
Azure virtual machines provide operation system virtualization.
Azure Virtual Machines (VM) is one of several types of on-demand, scalable computing resources that Azure offers. Typically, you choose a VM when you need more control over the computing environment than the other choices offer.
Box 2:
Azure Container Instances provide portable environments for virtualized applications.
Containers are becoming the preferred way to package, deploy, and manage cloud applications. Azure Container Instances offers the fastest and simplest way to run a container in Azure, without having to manage any virtual machines and without having to adopt a higher-level service.
Containers offer significant startup benefits over virtual machines (VMs). Azure Container Instances can start containers in Azure in seconds, without the need to provision and manage VMs.
Box 3:

Azure App Service is used to build, deploy and scale web apps.
Azure App Service is a platform-as-a-service (PaaS) offering that lets you create web and mobile apps for any platform or device and connect to data anywhere, in the cloud or on-premises. App Service includes the web and mobile capabilities that were previously delivered separately as Azure Websites and Azure Mobile Services.
Box 4:
Azure Functions provide a platform for serverless code.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/overview https://docs.microsoft.com/en-us/azure/security/fundamentals/paas-applications-using-app-services https://docs.microsoft.com/en-us/azure/azure-functions/ https://docs.microsoft.com/en-us/azure/container-instances/container-instances-overview

Question: 193 CertyIQ

Which service provides serverless computing in Azure?

A. Azure Virtual Machines
B. Azure Functions
C. Azure storage account
D. Azure dedicated hosts

Answer: B

Explanation:
Azure Functions provide a platform for serverless code.
Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Reference:
https://docs.microsoft.com/en-us/azure/azure-functions/

Question: 194 CertyIQ

An Azure administrator plans to run a PowerShell script that creates Azure resources.
You need to recommend which computer configuration to use to run the script.
Which three computers can run the script? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. a computer that runs macOS and has PowerShell Core 6.0 installed.
B. a computer that runs Windows 10 and has the Azure PowerShell module installed.
C. a computer that runs Linux and has the Azure PowerShell module installed.
D. a computer that runs Linux and has the Azure CLI tools installed.
E. a computer that runs Chrome OS and uses Azure Cloud Shell.

Answer: BCE

Explanation:

A: wrong, you need Azure Powershell Module, Powershell only isn't enough

B: correct, you have Powershell and the module to create Azure resources

C: correct, you have Powershell and the module to create Azure resources

D: wrong, with Azure CLI you don't execute Powershell script

E: correct, from a browser you can connect to Azure Portal and execute Azure Powershell comdlet

Question: 195 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription named Subscription1. You sign in to the Azure portal and create a resource group named RG1.
From Azure documentation, you have the following command that creates a virtual machine named VM1. az vm create --resource-group RG1 --name VM1 --image UbuntuLTS --generate-ssh-keys
You need to create VM1 in Subscription1 by using the command.
Solution: From the Azure portal, launch Azure Cloud Shell and select Bash. Run the command in Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:

The command can be run in the Azure Cloud Shell.

The Azure Cloud Shell is a free interactive shell. It has common Azure tools preinstalled and configured to use with your account.

To open the Cloud Shell, just select Try it from the upper right corner of a code block. You can also launch Cloud Shell in a separate browser tab by going to https://shell.azure.com/bash.

While using the command subscription is not mentioned and some of us would look why subscription command was not used however all details mentioned in question was mentioned. For creating a virtual machine though power shall or bas, there is no requirement to put the subscription details. Name of VM and resource group are sufficient to create a vm.

References:

https://docs.microsoft.com/en-us/azure/virtual-machines/linux/quick-create-cli

Question: 196 CertyIQ

Your company has several business units.
Each business unit requires 20 different Azure resources for daily operation. All the business units require the

same type of Azure resources.
You need to recommend a solution to automate the creation of the Azure resources.
What should you include in the recommendations?

A. Azure Resource Manager templates
B. virtual machine scale sets
C. the Azure API Management service
D. management groups

Answer: A

Explanation:
You can use Azure Resource Manager templates to automate the creation of the Azure resources. Deploying resource through templates is known as
'Infrastructure as code'.
To implement infrastructure as code for your Azure solutions, use Azure Resource Manager templates. The template is a JavaScript Object Notation (JSON) file that defines the infrastructure and configuration for your project. The template uses declarative syntax, which lets you state what you intend to deploy without having to write the sequence of programming commands to create it. In the template, you specify the resources to deploy and the properties for those resources.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/templates/overview

Question: 197

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can use Azure Cost Management to view costs associated to management groups.	○	○
You can use Azure Cost Management to view costs associated to resource groups.	○	○
You can use Azure Cost Management to view the usage of virtual machines during the last three months.	○	○

Answer:

Answer Area

Statements	Yes	No
You can use Azure Cost Management to view costs associated to management groups.	○	○
You can use Azure Cost Management to view costs associated to resource groups.	○	○
You can use Azure Cost Management to view the usage of virtual machines during the last three months.	○	○

Explanation:

Yes : Azure Cost Management allows you to view costs associated with management groups.

Yes : Azure Cost Management allows you to view costs associated with resource groups.

Yes : Azure Cost Management allows you to view the usage of VMs over a specified period, including the last three months.

Question: 198 CertyIQ

What can you use to identify underutilized or unused Azure virtual machines?

A. Azure Advisor

B. Azure Cost Management + Billing

C. Azure reservations

D. Azure Policy

Answer: A

Explanation:

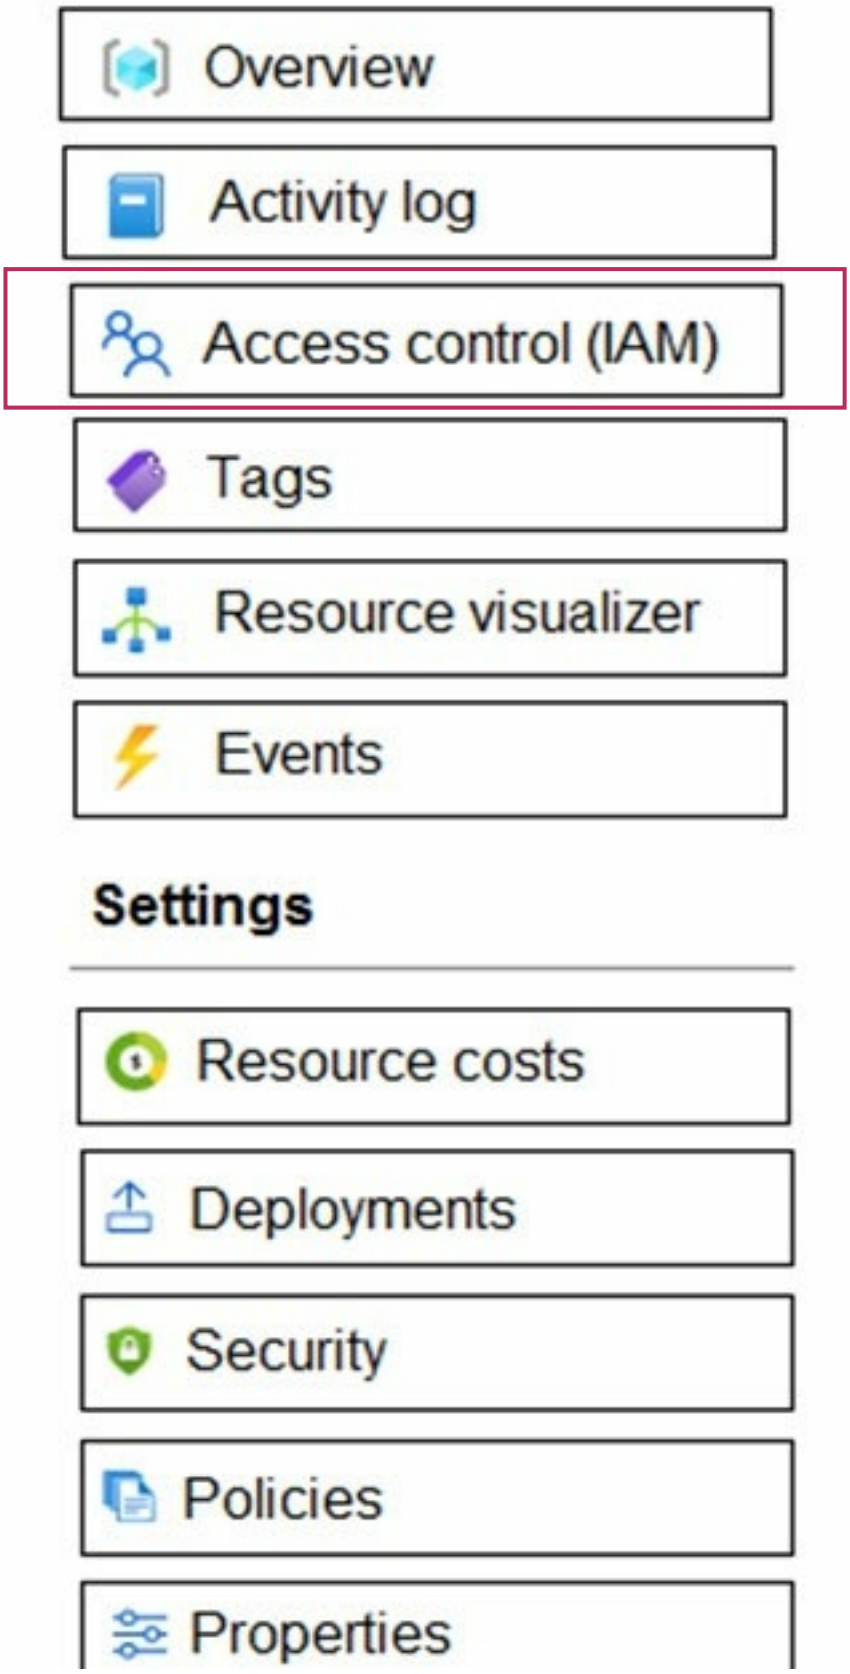

Azure Advisor helps you optimize and reduce your overall Azure spend by identifying idle and underutilized resources. You can get cost recommendations from the Cost tab on the Advisor dashboard.

Reference:
https://docs.microsoft.com/en-us/azure/advisor/advisor-overview

Question: 199 CertyIQ

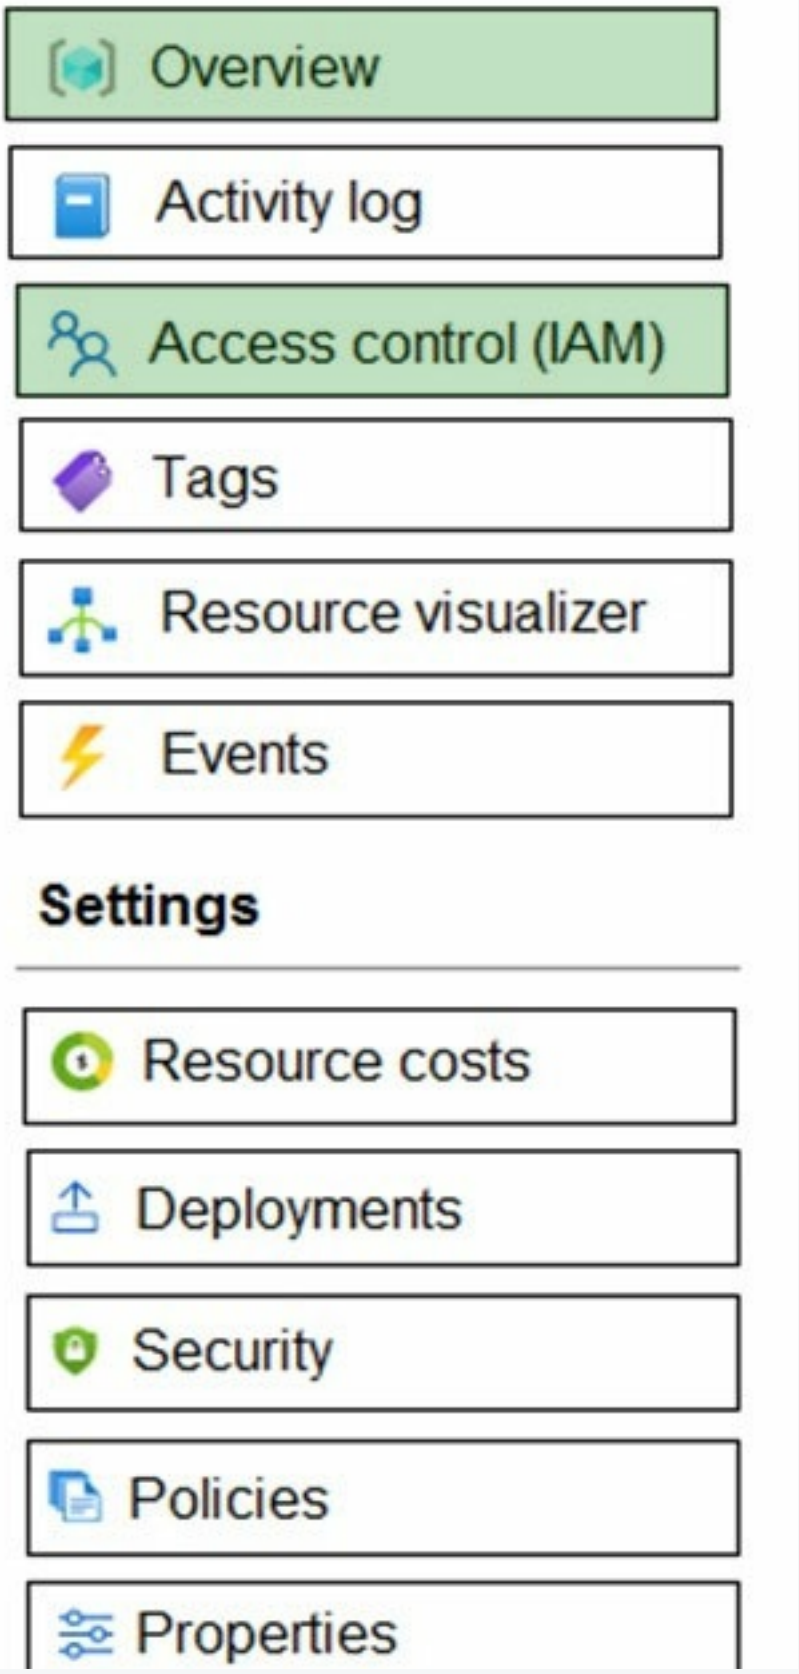

HOTSPOT -
Which node in the Azure portal should you use to assign a user the Reader role for a resource group? To answer, select the node in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:

In Exam, you will get only one option to be selected, Please choose IAM in that case:

Correct Answer: Identity Acces amnagement is the answer (IAM)

Box 1: Overview -

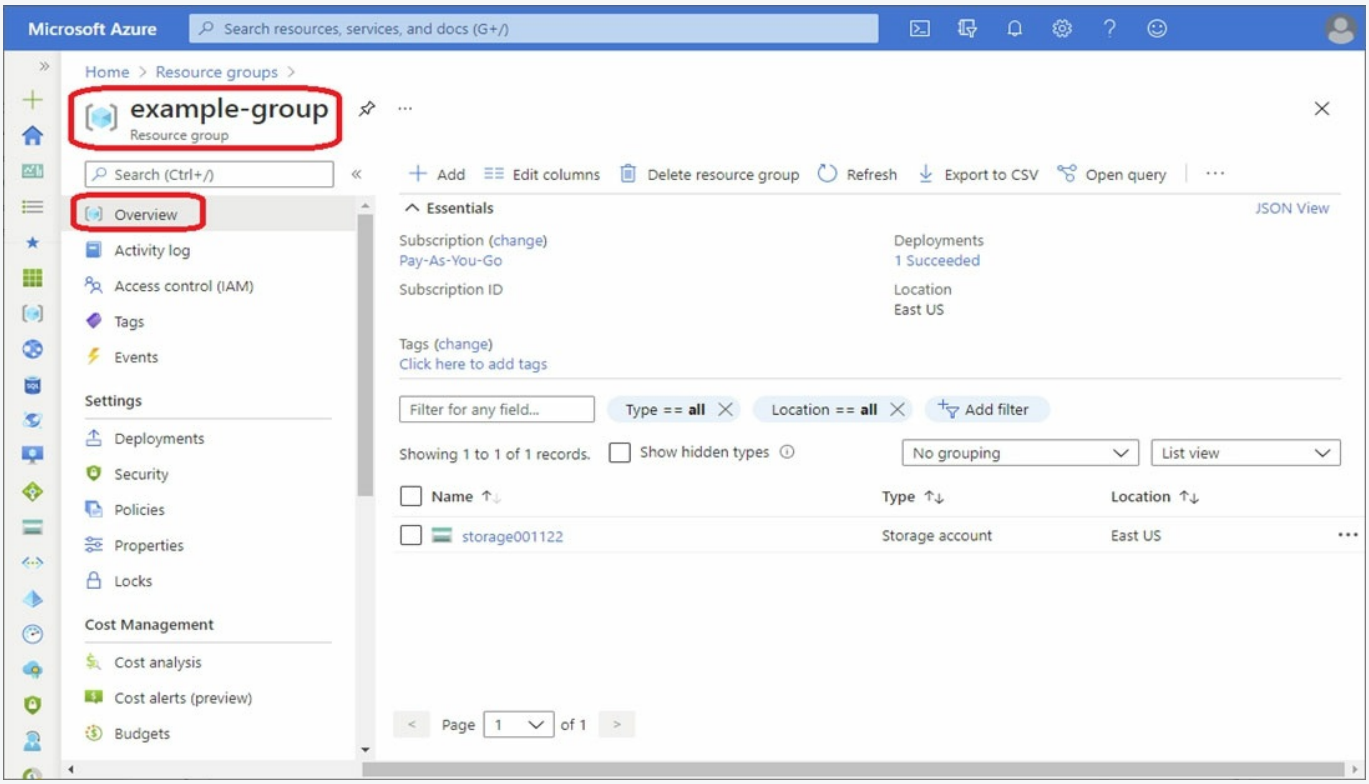

When you assign roles, you must specify a scope. Scope is the set of resources the access applies to. In Azure, you can specify a scope at four levels from broad to narrow: management group, subscription, resource group, and resource.

1. Sign in to the Azure portal.

2. In the Search box at the top, search for the scope you want to grant access to. For example, search for Management groups, Subscriptions, Resource groups, or a specific resource.

3. Click the specific resource for that scope.

4. The following shows an example resource group.

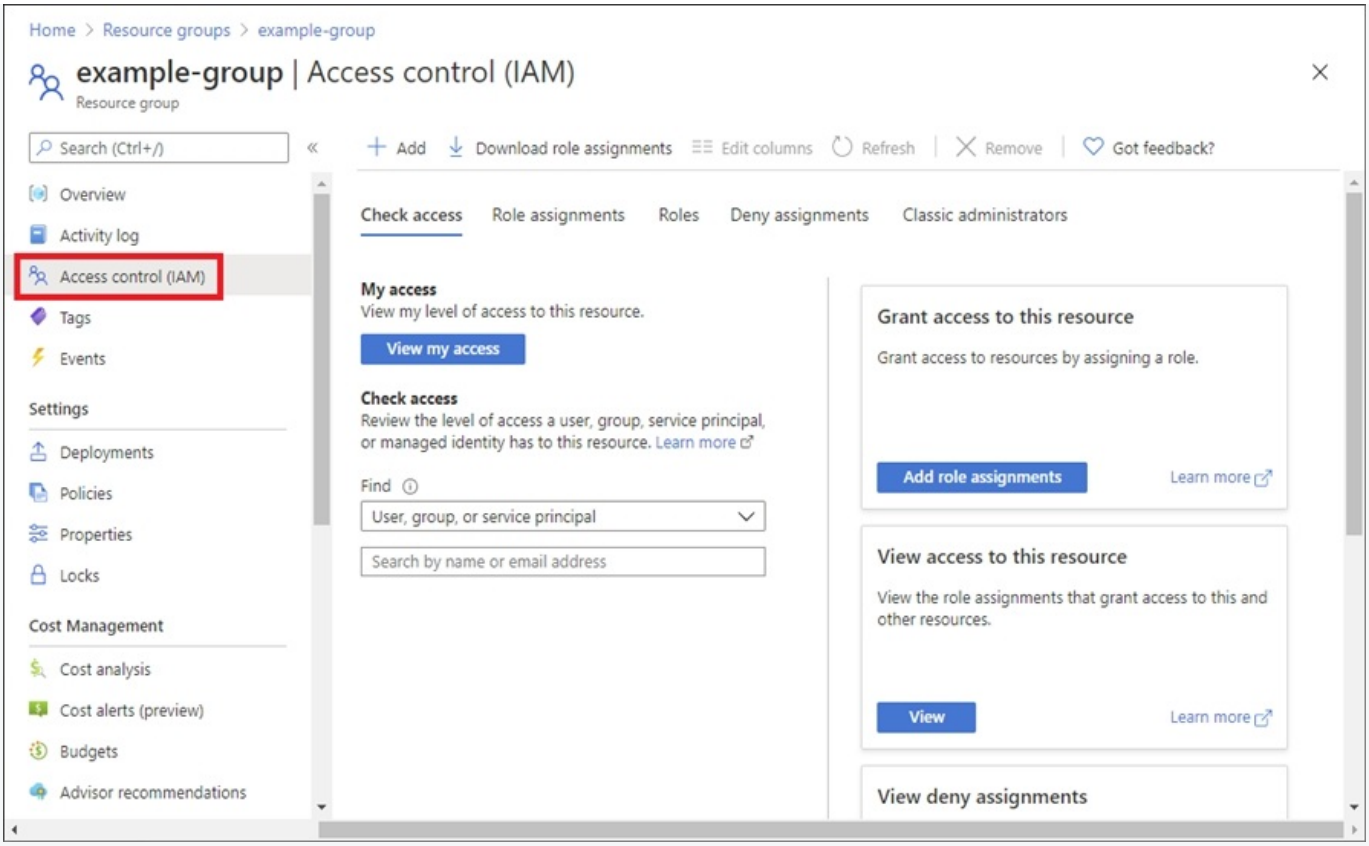

Box 2: Access control (IAM)

Access control (IAM) is the page that you typically use to assign roles to grant access to Azure resources. It's also known as identity and access management

(IAM) and appears in several locations in the Azure portal.

1. Click Access control (IAM).

The following shows an example of the Access control (IAM) page for a resource group.

2. Click the Role assignments tab to view the role assignments at this scope.

3. Click Add > Add role assignment.

If you don't have permissions to assign roles, the Add role assignment option will be disabled.

4. The Add role assignment page opens.

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:

Box 1: Yes -

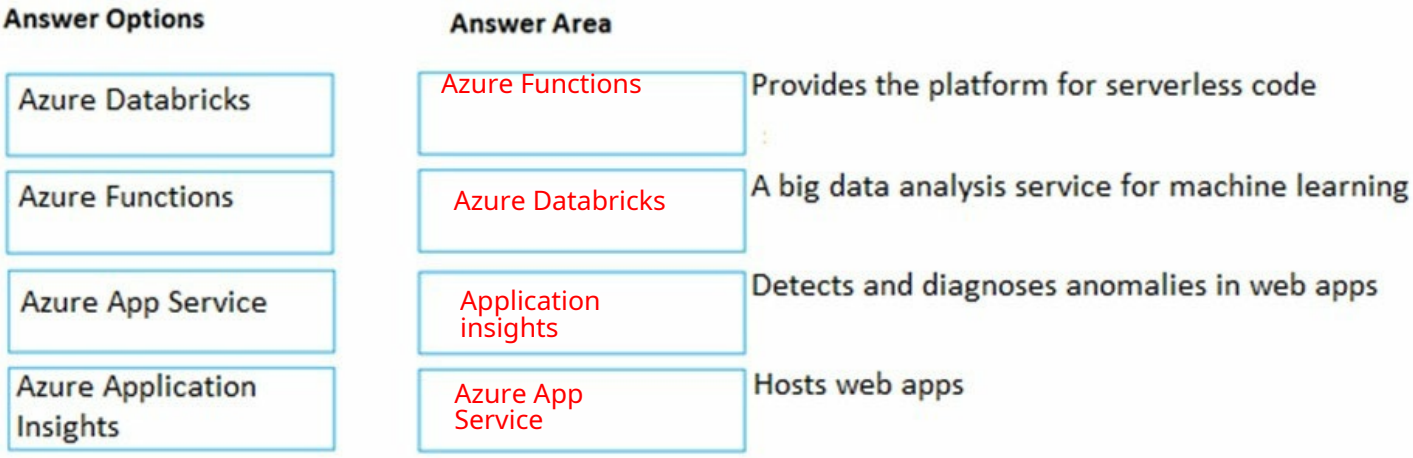

Box 2: No -
Cloud services can be managed through https://portal.azure.com/
In the Cloud Services area of the Azure portal, you can:
Update a service role or a deployment.
Promote a staged deployment to production.
Link resources to your cloud service so that you can see the resource dependencies and scale the resources together.
Delete a cloud service or a deployment.

Box 3: Yes -

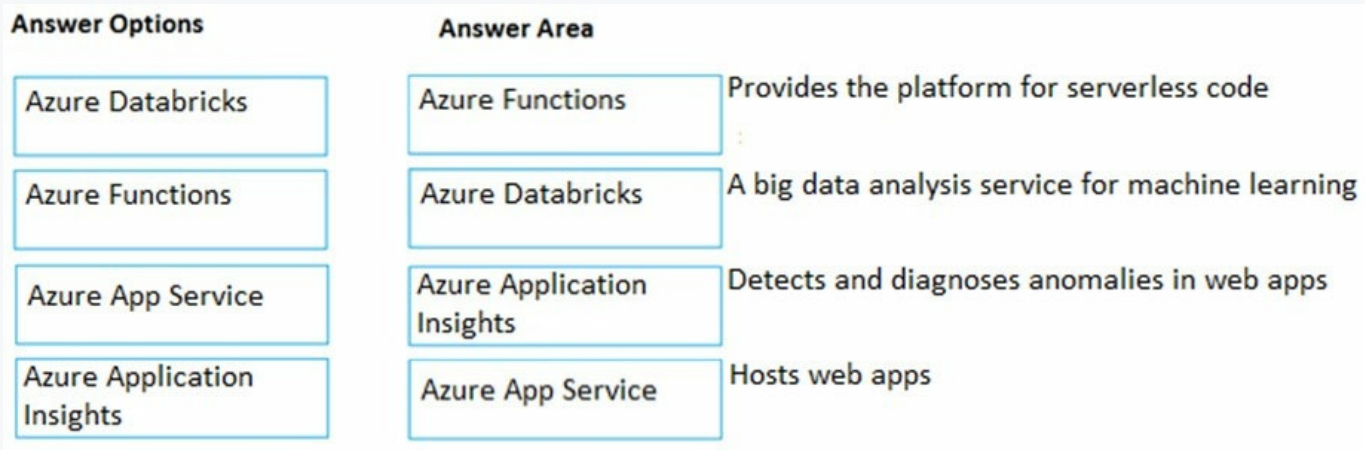

Reference:
https://docs.microsoft.com/en-us/azure/cloud-services/cloud-services-how-to-manage-portal

Question: 202 CertyIQ

DRAG DROP -
Match the Azure service to the correct definition.
Instructions: To answer, drag the appropriate Azure service from the column on the left to its description on the right. Each service may be used once, more than once, or not at all.
NOTE: Each correct selection is worth one point.
Select and Place:

Answer:

Explanation:

Serverless ---> Functions

big data analysis ---> Databricks

anomalies ---> Insights

Host ---> App Service

Box 1:

Azure Functions provides the platform for serverless code.

Azure Functions is a serverless compute service that lets you run event-triggered code without having to explicitly provision or manage infrastructure.

Box 2:

Azure Databricks is a big analysis service for machine learning.

Azure Databricks is an Apache Spark-based analytics platform. The platform consists of several components including 'MLib'. Mlib is a Machine Learning library consisting of common learning algorithms and utilities, including classification, regression, clustering, collaborative filtering, dimensionality reduction, as well as underlying optimization primitives.

Box 3:

Azure Application Insights detects and diagnoses anomalies in web apps.

Application Insights, a feature of Azure Monitor, is an extensible Application Performance Management (APM) service for developers and DevOps professionals.

Use it to monitor your live applications. It will automatically detect performance anomalies, and includes powerful analytics tools to help you diagnose issues and to understand what users actually do with your app.

Box 4:

Azure App Service hosts web apps.

Azure App Service is an HTTP-based service for hosting web applications, REST APIs, and mobile back ends. You can develop in your favorite language, be it

.NET, .NET Core, Java, Ruby, Node.js, PHP, or Python. Applications run and scale with ease on both Windows and Linux-based environments.

References:

https://docs.microsoft.com/en-us/azure/azure-functions/

https://docs.microsoft.com/en-us/azure/azure-databricks/what-is-azure-databricks#apache-spark-based-analytics-platform https://docs.microsoft.com/en-us/azure/azure-monitor/app/app-insights-overview https://docs.microsoft.com/en-us/azure/app-service/overview

Question: 203 CertyIQ

A team of developers at your company plans to deploy, and then remove, 50 customized virtual machines each week. Thirty of the virtual machines run Windows
Server 2016 and 20 of the virtual machines run Ubuntu Linux.
You need to recommend which Azure service will minimize the administrative effort required to deploy and remove the virtual machines.
What should you recommend?

A. Azure Reserved Virtual Machines (VM) Instances
B. Azure virtual machine scale sets
C. Azure DevTest Labs
D. Microsoft Managed Desktop

Answer: C

Explanation:
DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates.
By using DevTest Labs, you can test the latest versions of your applications by doing the following tasks:
- Quickly provision Windows and Linux environments by using reusable templates and artifacts.
- Easily integrate your deployment pipeline with DevTest Labs to provision on-demand environments.
- Scale up your load testing by provisioning multiple test agents and create pre-provisioned environments for training and demos.

Reference:
https://docs.microsoft.com/en-us/azure/lab-services/devtest-lab-overview

Question: 204

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure PowerShell modules can be installed on macOS.	○	○
Azure Cloud Shell can be accessed from a web browser on a Linux computer.	○	○
The Azure portal can only be accessed from a Windows device.	○	○

Answer:

Answer Area

Statements	Yes	No
Azure PowerShell modules can be installed on macOS.	◯	◯
Azure Cloud Shell can be accessed from a web browser on a Linux computer.	◯	◯
The Azure portal can only be accessed from a Windows device.	◯	◯

Explanation:

You can install the Az PowerShell module locally on Windows, macOS, and Linux. It can also be used from a browser through Azure Cloud Shell or inside a

Docker container.

Reference:

https://docs.microsoft.com/en-us/powershell/azure/what-is-azure-powershell?view=azps-6.6.0
https://serverfault.com/questions/323973/how-do-i-access-the-windows-azure-management-portal-from-ubuntu

Question: 205 CertyIQ

A support engineer plans to perform several Azure management tasks by using the Azure CLI.
You install the CLI on a computer.
You need to tell the support engineer which tools to use to run the CLI.
Which two tools should you instruct the support engineer to use? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Command Prompt
B. Azure Resource Explorer
C. Windows PowerShell
D. Windows Defender Firewall
E. Network and Sharing Center

Answer: AC

Explanation:
For Windows the Azure CLI is installed via an MSI, which gives you access to the CLI through the Windows Command Prompt (CMD) or PowerShell.

Reference:
https://docs.microsoft.com/en-us/cli/azure/install-azure-cli-windows?view=azure-cli-latest

Question: 206 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use PowerShell in Azure Cloud Shell.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
Azure Cloud Shell is a browser-based shell experience to manage and develop Azure resources.
Cloud Shell offers a browser-accessible, pre-configured shell experience for managing Azure resources without the overhead of installing, versioning, and maintaining a machine yourself.
Being browser-based, Azure Cloud Shell can be run on a browser from a tablet that runs the Android operating system.

Reference:
https://docs.microsoft.com/en-us/azure/cloud-shell/features

Question: 207 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use the PowerApps portal.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:

powerapp:website

azure portal:vm

PowerApps lets you quickly build business applications with little or no code. It is not used to create Azure virtual machines. Therefore, this solution does not meet the goal.

PowerApps Portals allow organizations to create websites which can be shared with users external to their organization either anonymously or through the login provider of their choice like LinkedIn, Microsoft Account,

other commercial login providers.

References:

https://powerapps.microsoft.com/en-us/blog/introducing-powerapps-portals-powerful-low-code-websites-for-external-users/

Question: 208 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure environment. You need to create a new Azure virtual machine from a tablet that runs the Android operating system.
Solution: You use the Azure portal.
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
The Azure portal is a web-based, unified console that provides an alternative to command-line tools. With the Azure portal, you can manage your Azure subscription using a graphical user interface. You can build, manage, and monitor everything from simple web apps to complex cloud deployments. Create custom dashboards for an organized view of resources. Configure accessibility options for an optimal experience. Being web-based, the Azure portal can be run on a browser from a tablet that runs the Android operating system.

Reference:
https://docs.microsoft.com/en-us/azure/azure-portal/azure-portal-overview

Question: 209 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

The Microsoft 365 Compliance admin center
The Microsoft 365 Defender portal
Microsoft Defender for Cloud in the Azure portal
Microsoft Trust Center

provides in-depth information about security, privacy, compliance offerings, policies, and features across Microsoft cloud products.

Answer: Microsoft Trust Center: Microsoft's dedicated public-facing informational portal that details how Microsoft implements and supports security, privacy, compliance offerings, transparency, and data protection policies across all Microsoft cloud products and services (Azure, Microsoft 365, Dynamics 365, Power Platform).

Unlike administrative management tools or security dashboards that configure tenant settings, the Trust Center serves as an informational reference library containing compliance reports, regulatory documentation, security white papers, and privacy commitments.

Explanation:

Microsoft Trust Center"

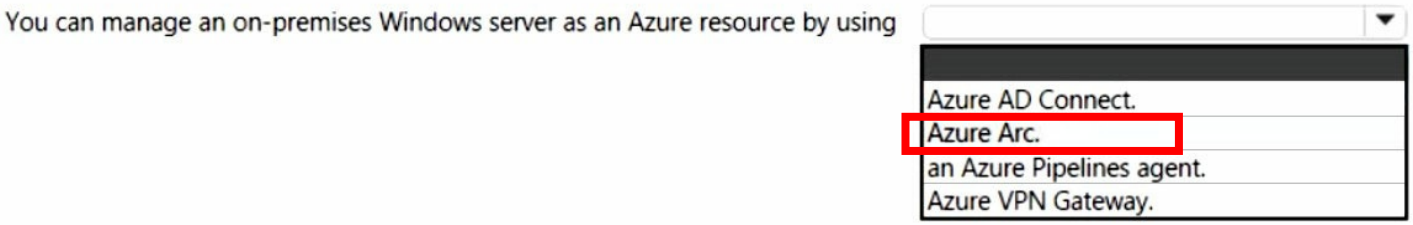

The Microsoft feature that provides in-depth information about security, privacy, compliance offerings, policies, and features across Microsoft cloud products is called the Microsoft Trust Center. The Trust Center is a centralized hub that offers comprehensive resources and documentation to help customers understand and evaluate the security and compliance capabilities of Microsoft Cloud services.

Question: 210

Once registered, the machine receives a Resource ID, can be placed into Resource Groups, tagged, audited/governed with Azure Policy, managed with Microsoft Defender for Cloud, and controlled via Azure RBAC just like a native Azure Virtual Machine.

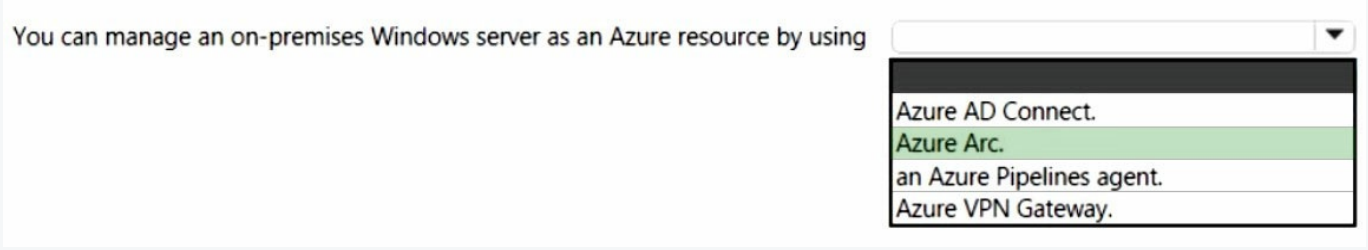

CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Azure Arc: Extends the Azure Resource Manager (ARM) control plane to hybrid and multi-cloud environments. By installing the Connected Machine agent on an on-premises Windows or Linux server, that server is registered as a first-class Azure resource.

Answer:

Explanation:
Azure Arc simplifies governance and management by delivering a consistent multi-cloud and on-premises management platform.
Azure Arc provides a centralized, unified way to:
Manage your entire environment together by projecting your existing non-Azure and/or on-premises resources into Azure Resource Manager.
Manage virtual machines, Kubernetes clusters, and databases as if they are running in Azure.
Etc.
Incorrect:
* Why use Azure AD Connect?
Integrating your on-premises directories with Azure AD makes your users more productive by providing a common identity for accessing both cloud and on- premises resources. Users and organizations can take advantage of:
Users can use a single identity to access on-premises applications and cloud services such as Microsoft 365.
Single tool to provide an easy deployment experience for synchronization and sign-in.
Provides the newest capabilities for your scenarios. Azure AD Connect replaces older versions of identity

integration tools such as DirSync and Azure AD Sync.
* VPN Gateway sends encrypted traffic between an Azure virtual network and an on-premises location over the public Internet. You can also use VPN Gateway to send encrypted traffic between Azure virtual networks over the Microsoft network. A VPN gateway is a specific type of virtual network gateway.
* Pipeline agent is machine where your build is performed. An agent is installable software that runs one job at a time. Agent job is a set of steps which is recognized as execution boundary. Each job runs on an agent. All of the steps run together on the same agent.

Reference:
https://docs.microsoft.com/en-us/azure/azure-arc/overview

Question: 211 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statements	Yes	No
You can only manage cloud services from Windows devices.	○	○
You can manage cloud services from the command line.	○	○
You can manage cloud services by using a web browser.	○	○

Answer:

Statements	Yes	No
You can only manage cloud services from Windows devices.	○	○
You can manage cloud services from the command line.	○	○
You can manage cloud services by using a web browser.	○	○

Explanation:

Box 1: No -

Easily manage your Azure storage accounts in the cloud, from Windows, macOS, or Linux, using Azure Storage Explorer.

Box 2: Yes -

Azure cloud services can be managed in Azure Automation by using the PowerShell cmdlets that are available in the Azure PowerShell tools.

Box 3: Yes -

>>>>>>>>>>>>>>>>>>>>>>>

You can only manage cloud services from windows devices - No. You can connect to your Cloud PC on any platform that has either the Microsoft Remote Desktop app or an HTML5-capable browser to access the web client. Windows devices will provide the optimal experience

You can manage cloud services from the command line >> Yes

You can manage cloud services by using a web browser >> Yes . Microsoft Azure is an example of a public cloud. With a public cloud, all hardware, software and other supporting infrastructure is owned and managed by the cloud provider. You access these services and manage your account using a web browser.

>>>>>>>>>>>>>>>>>>>>>>>>

Reference:

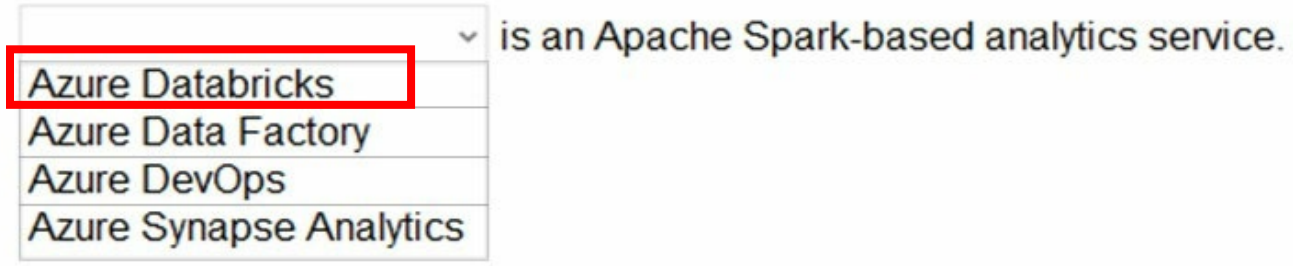

https://azure.microsoft.com/en-us/features/storage-explorer/

https://docs.microsoft.com/en-us/azure/cloud-services/automation-manage-cloud-services

Question: 212 CertyIQ

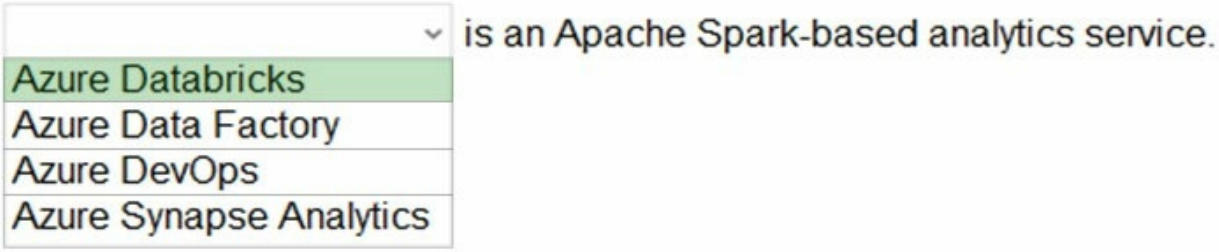

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:
Azure Databricks is an Apache Spark-based analytics platform. The platform consists of several components including 'MLib'. Mlib is a Machine Learning library consisting of common learning algorithms and utilities, including classification, regression, clustering, collaborative filtering, dimensionality reduction, as well as underlying optimization primitives.

Reference:
https://docs.microsoft.com/en-us/azure/azure-databricks/what-is-azure-databricks#apache-spark-based-analytics-platform

Question: 213 CertyIQ

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Azure Monitor routes notifications through Action Groups. Action Groups support sending emails directly to individual email addresses, SMS, push notifications, voice, webhooks, or to members holding specific Azure Resource Manager (ARM) subscription roles (such as Owner, Contributor, or Monitoring Reader). However, you cannot directly target an Azure Active Directory (Microsoft Entra ID) security group as an alert destination in an Action Group notification.

Answer Area

Statements	Yes	No
Azure Monitor can monitor the performance of on-premises computers.	○	○
Azure Monitor can send alerts to Azure Active Directory security groups.	○	○
Azure Monitor can trigger alerts based on data in an Azure Log Analytics workspace.	○	○

Azure Monitor supports Log Alerts. These rules run scheduled queries written in KQL (Kusto Query Language) against data stored in an Azure Log Analytics workspace and fire an alert whenever the query result count or metric measurement exceeds specified threshold criteria.

Answer:

Answer Area

Statements	Yes	No
Azure Monitor can monitor the performance of on-premises computers.	○	○
Azure Monitor can send alerts to Azure Active Directory security groups.	○	○
Azure Monitor can trigger alerts based on data in an Azure Log Analytics workspace.	○	○

Explanation:

Box 1: Yes -

Azure Monitor maximizes the availability and performance of your applications and services by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments.

Box 2: Yes -

Alerts in Azure Monitor proactively notify you of critical conditions and potentially attempt to take corrective action.

Box 3: Yes -

Azure Monitor uses Target Resource, which is the scope and signals available for alerting. A target can be any Azure resource. Example targets: a virtual machine, a storage account, a virtual machine scale set, a Log Analytics workspace, or an Application Insights resource.

References:

https://docs.microsoft.com/en-us/azure/azure-monitor/overview https://docs.microsoft.com/en-us/azure/azure-monitor/platform/alerts-overview

Question: 214 CertyIQ

Which Azure service provides a set of version control tools to manage code?

A. Azure Repos
B. Azure DevTest Labs
C. Azure Storage
D. Azure Cosmos DB

Azure Repos: Part of Azure DevOps Services, providing private and public Git repositories (as well as Team Foundation Version Control / TFVC) for source code management. It includes branching, pull requests, code reviews, and semantic search to collaborate on and track code revisions.

Answer: A

Explanation:

A. Azure Repos.

Azure Repos is a service within Azure DevOps that provides a set of version control tools to manage code. It supports both Git repositories and Team Foundation Version Control (TFVC), allowing teams to collaborate on code development efficiently. The other options listed (Azure DevTest Labs, Azure Storage, and Azure Cosmos DB) are not primarily focused on version control or code management.

Azure Repos is a set of version control tools that you can use to manage your code.

Azure repo is a part of Azure DevOps

Incorrect Answers:

B: Azure DevTest Labs creates labs consisting of pre-configured bases or Azure Resource Manager templates. These have all the necessary tools and software that you can use to create environments.

D: Azure Cosmos DB is Microsoft's globally distributed, multi-model database service.

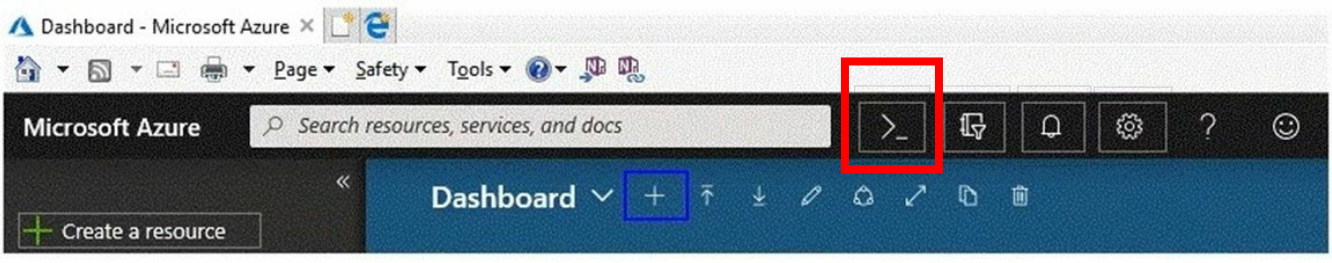

References:

https://docs.microsoft.com/en-us/azure/devops/repos/get-started/what-is-repos?view=azure-devops

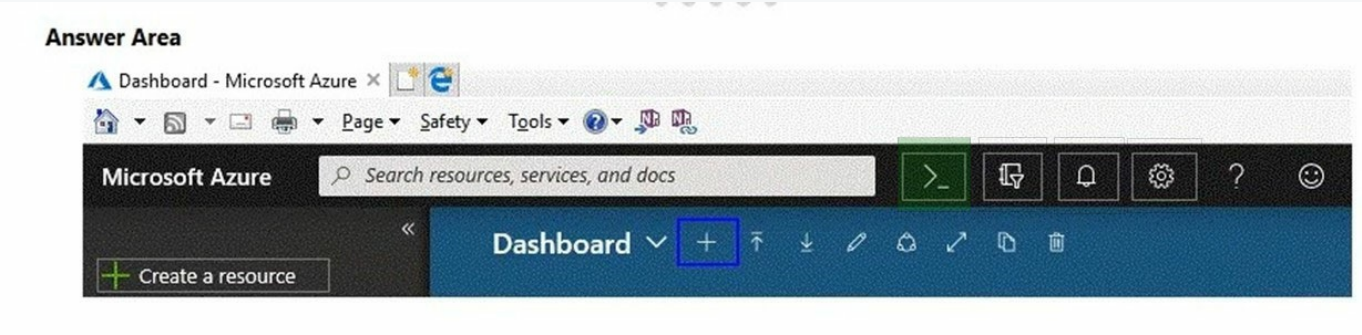

Question: 215 CertyIQ

HOTSPOT -
You need to manage Azure by using Azure Cloud Shell.
Which Azure portal icon should you select? To answer, select the appropriate icon in the answer area.
Hot Area:

Answer Area

Answer:

Explanation:

Select the button on top right side which is similar to ">-" signed.

You can access Azure Cloud Shell in the Azure portal by clicking the icon.

Azure Cloud Shell is an interactive, authenticated, browser-accessible shell for managing Azure resources. It provides the flexibility of choosing the shell experience that best suits the way you work, either Bash or PowerShell.

Cloud Shell enables access to a browser-based command-line experience built with Azure management tasks in mind.

References:

https://docs.microsoft.com/en-us/azure/cloud-shell/overview?view=azure-cli-latest

Question: 216 CertyIQ

You have a virtual machine named VM1 that runs Windows Server 2016. VM1 is in the East US Azure region.
Which Azure service should you use from the Azure portal to view service failure notifications that can affect the availability of VM1?

A. Azure Service Fabric
B. Azure Monitor
C. Azure virtual machines
D. Azure Advisor

Azure Monitor / Azure Service Health integration: In the Azure portal, platform-level service outage notifications, planned maintenance windows, and resource health degradation events are reported through Azure Service Health, which is exposed and managed directly under the Azure Monitor service suite (via Azure Monitor > Service Health or Resource Health).

Answer: B

Explanation:

Azure Monitor maximizes the availability and performance of your applications by delivering a comprehensive solution for collecting, analyzing, and acting on telemetry from your cloud and on-premises environments. It helps you understand how your applications are performing and proactively identifies issues affecting them and the resources they depend on.

Service health notifications are published by the Azure infrastructure into the Azure activity log. The notifications contain information about the resources under your subscription.

View your service health notifications in the Azure portal

In the Azure portal, select Monitor.

Azure Monitor brings together all your monitoring settings and data into one consolidated view. It first opens to the Activity log section.

Select Alerts.

Select +Add activity log alert, and set up an alert to ensure you are notified for future service notifications

Question: 217 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify an Azure Traffic Manager profile.
Does this meet the goal?

A. Yes
B. No

Network Security Groups (NSGs): By default, Azure Virtual Machines in a Virtual Network are protected by NSGs, and the default inbound rule DenyAllInBound blocks all incoming traffic from the internet. To allow inbound HTTP traffic (port 80) to VM1, you must configure an inbound security rule on a Network Security Group (NSG) associated with VM1's network interface (NIC) or its subnet.

Traffic Manager Role: Azure Traffic Manager is a DNS-based traffic load balancer, not a proxy, firewall, or port filter. It resolves DNS requests to the best available endpoint based on routing methods, but it cannot override network filtering or open ports on a VM.

Answer: B

Explanation:
Azure Traffic Manager is a DNS-based load balancing solution. It is not used to ensure that a virtual machine named VM1 is accessible from the Internet over
HTTP.
To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.
In this question, we need to add a rule to a network security group or Azure Firewall to allow the connection to the virtual machine on port 80 (HTTP).

Reference:
https://docs.microsoft.com/en-us/azure/traffic-manager/traffic-manager-overview

Question: 218 CertyIQ

Your company plans to deploy several web servers and several database servers to Azure.
You need to recommend an Azure solution to limit the types of connections from the web servers to the database servers.
What should you include in the recommendation?

A. network security groups (NSGs)
B. Azure Service Bus
C. a local network gateway
D. a route filter

Network Security Groups (NSGs): By default, Azure Virtual Machines in a Virtual Network are protected by NSGs, and the default inbound rule DenyAllInBound blocks all incoming traffic from the internet. To allow inbound HTTP traffic (port 80) to VM1, you must configure an inbound security rule on a Network Security Group (NSG) associated with VM1's network interface (NIC) or its subnet.

Traffic Manager Role: Azure Traffic Manager is a DNS-based traffic load balancer, not a proxy, firewall, or port filter. It resolves DNS requests to the best available endpoint based on routing methods, but it cannot override network filtering or open ports on a VM.

Answer: A

Explanation:
A network security group works like a firewall. You can attach a network security group to a virtual network

and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 219 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

From [ ] you can view which user turned off a specific virtual machine during the last 14 days.

- Azure Access Control IAM
- Azure Event Hubs
- Azure Activity Log
- Azure Service Health

Azure Activity Log: A platform-level service that provides insight into subscription-level control-plane events. It captures auditing and operational information whenever a resource is created, updated, or deleted via Azure Resource Manager (ARM).

Turning off or deallocating a virtual machine generates an event in the Activity Log that records:

Activity Log entries are retained automatically by Azure for 90 days by default, easily covering the 14-day window specified in the question

Answer:

Answer Area

From [Azure Activity Log] you can view which user turned off a specific virtual machine during the last 14 days.

- Azure Access Control IAM
- Azure Event Hubs
- Azure Activity Log
- Azure Service Health

Explanation:
You would use the Azure Activity Log, not Access Control to view which user turned off a specific virtual machine during the last 14 days.
Activity logs are kept for 90 days. You can query for any range of dates, as long as the starting date isn't more than 90 days in the past.
In this question, we would create a filter to display shutdown operations on the virtual machine in the last 14 days.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-audit

Question: 220 CertyIQ

Which service provides network traffic filtering across multiple Azure subscriptions and virtual networks?

A. Azure Firewall
B. an application security group

Azure Firewall: A managed, cloud-based network security service that protects Azure Virtual Network resources. It features built-in high availability and unrestricted cloud scalability. Centrally deployed in a hub virtual network, it enforces layer 3 to layer 7 network and application traffic-filtering rules globally across multiple spoke virtual networks and across different Azure subscriptions.

C. Azure DDoS protection

D. a network security group (NSG)

a network security group (NSG): An NSG filters inbound and outbound traffic at layers 3 and 4 for resources inside a virtual network. An individual NSG cannot be associated across multiple virtual networks or subscriptions; it is strictly scoped to subnets or network interfaces within the single virtual network where it resides.

Answer: A

Explanation:

You can restrict traffic to multiple virtual networks in multiple subscriptions with a single Azure firewall.

Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.

You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

Reference:

https://docs.microsoft.com/en-us/azure/firewall/overview

Question: 221

CertyIQ

Which Azure service should you use to store certificates?

A. Azure Security Center

B. an Azure Storage account

C. Azure Key Vault

D. Azure Information Protection

Answer: C

Explanation:

Certificate Management - Azure Key Vault is also a service that lets you easily provision, manage, and deploy public and private Secure Sockets Layer/Transport Layer Security (SSL/TLS) certificates for use with Azure and your internal connected resources

Azure Key Vault is a secure store for storage various types of sensitive information including passwords and certificates.

Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.

Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are

Federal Information Processing Standards (FIPS) 140-2 Level 2 validated.

Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

References:

https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview

Question: 222 CertyIQ

Which Azure service can you use as a security information and event management (SIEM) solution?

A. Azure Analysis Services
B. Azure Sentinel
C. Azure Information Protection
D. Azure Cognitive Services

SIEM & SOAR Capabilities: Microsoft Sentinel (formerly Azure Sentinel) is a scalable, cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automation, and Response (SOAR) solution.

It delivers intelligent security analytics and threat intelligence across an entire enterprise by collecting data at cloud scale across all users, devices, applications, and infrastructure (both on-premises and in multiple clouds), detecting undetected threats, investigating threats with artificial intelligence, and responding rapidly via built-in automation playbooks.

Answer: B

Explanation:

Microsoft Azure Sentinel is a scalable, cloud-native, security information event management (SIEM) and security orchestration automated response (SOAR) solution.

Reference:

https://azure.microsoft.com/en-in/services/azure-sentinel/

Question: 223 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 1 (No): Microsoft Sentinel (Azure Sentinel) runs directly on top of an Azure Log Analytics workspace, not a standard Azure Storage account. All ingested logs, tables, and security telemetry are stored and queried within the Log Analytics data store using KQL (Kusto Query Language).

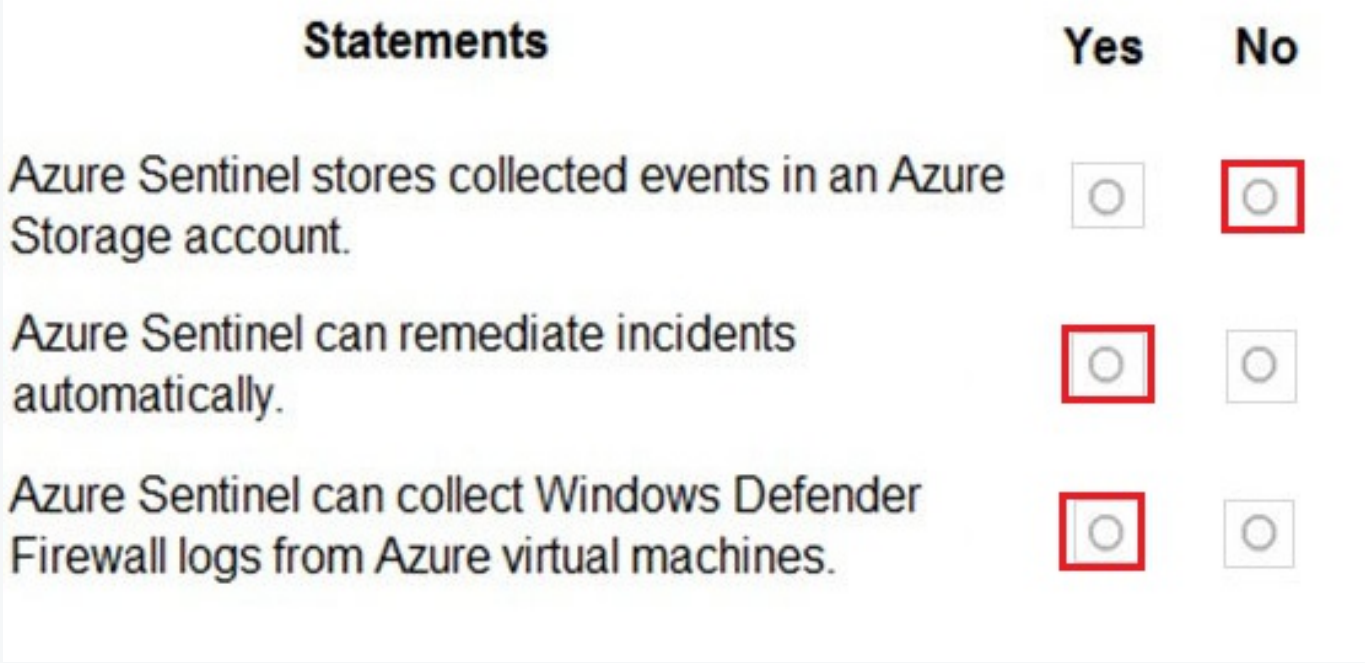

Statements	Yes	No
Azure Sentinel stores collected events in an Azure Storage account.	○	○
Azure Sentinel can remediate incidents automatically.	○	○
Azure Sentinel can collect Windows Defender Firewall logs from Azure virtual machines.	○	○

Answer:

Statement 2 (Yes): Microsoft Sentinel includes SOAR (Security Orchestration, Automation, and Response) capabilities. It uses automation rules and playbooks (powered by Azure Logic Apps) to trigger automated remediation actions (such as isolating a host, resetting a compromised user account, or modifying firewall rules) immediately when an incident or alert is generated.

Statement 3 (Yes): Sentinel collects host-level operating system logs—including Windows Defender Firewall logs—from Azure VMs using native data connectors via the Azure Monitor Agent (AMA) / Log Analytics data collection rules.

Answer Area

Explanation:

No. Azure Sentinel stores collected events in Azure Log Analytics workspaces, not in an Azure Storage account.

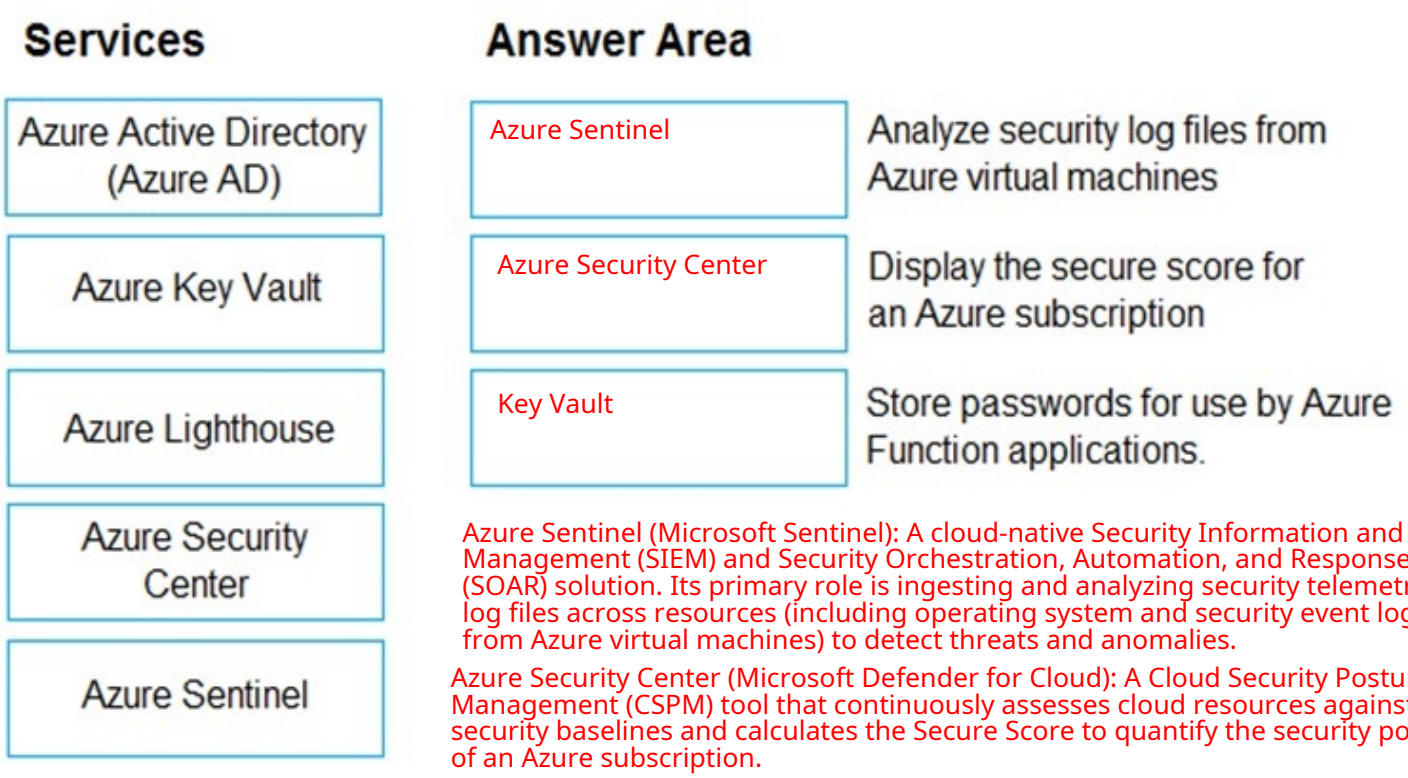

Yes. Azure Sentinel can remediate incidents automatically using Playbooks, which are collections of procedures that can be run from Azure Sentinel.

Yes. Azure Sentinel can collect Windows Defender firewall logs from Azure VMs.

Question: 224

CertyIQ

DRAG DROP -
Match the Azure Services service to the correct descriptions.
Instructions: To answer, drag the appropriate service from the column on the left to its description on the right.
Each service may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Azure Sentinel (Microsoft Sentinel): A cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automation, and Response (SOAR) solution. Its primary role is ingesting and analyzing security telemetry and log files across resources (including operating system and security event logs from Azure virtual machines) to detect threats and anomalies.

Azure Security Center (Microsoft Defender for Cloud): A Cloud Security Posture Management (CSPM) tool that continuously assesses cloud resources against security baselines and calculates the Secure Score to quantify the security posture of an Azure subscription.

Answer:

1.Azure Sentinel, 2.Azure Security Center, 3.Azure Key Vault

Explanation:

Box 1: Azure Sentinel -

Box 2: Azure Security Center -

Box 3: Azure Key Vault -

✑ Azure Active Directory (Azure AD)

Azure AD is an identity and access management service, which helps your employees sign in and access resources

✑ Azure Lighthouse

Azure Lighthouse is used for cross- and multi-tenant management.

Reference:

https://docs.microsoft.com/en-us/azure/sentinel/overview

https://docs.microsoft.com/en-us/azure/lighthouse/overview

Question: 225

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Hot Area:

Azure Firewall: A stateful network traffic filtering service (Layer 3 to Layer 7). It inspects and permits or blocks packets, but it does not encrypt outbound traffic sent to the public Internet.

Answer Area

Statements	Yes	No
Azure Firewall will encrypt all the network traffic sent from Azure to the Internet.	○	○
A network security group (NSG) will encrypt all the network traffic sent from Azure to the Internet.	○	○
Azure virtual machines that run Windows Server 2016 can encrypt network traffic sent to the Internet.	○	○

Network Security Group (NSG): A basic Layer 3/4 packet-filtering firewall rule set (Source, Destination, Port, Protocol). It enforces allow/deny security rules; it has no encryption capabilities whatsoever

Virtual Machines (Windows Server 2016): An operating system running inside a VM can establish encrypted sessions (such as TLS/HTTPS, SSH, IPsec, or VPN client connections) directly from the OS/application layer out to internet endpoints

Answer:

Answer Area

Statements	Yes	No
Azure Firewall will encrypt all the network traffic sent from Azure to the Internet.	○	○
A network security group (NSG) will encrypt all the network traffic sent from Azure to the Internet.	○	○
Azure virtual machines that run Windows Server 2016 can encrypt network traffic sent to the Internet.	○	○

Explanation:

Box 1: No -

Azure firewall does not encrypt network traffic. It is used to block or allow traffic based on source/destination IP address, source/destination ports and protocol.

Box 2: No -

A network security group does not encrypt network traffic. It works in a similar way to a firewall in that it is used to block or allow traffic based on source/ destination IP address, source/destination ports and protocol.

Box 3: No -

The question is rather vague as it would depend on the configuration of the host on the Internet. Windows Server does come with a VPN client and it also supports other encryption methods such IPSec encryption or SSL/TLS so it could encrypt the traffic if the Internet host was configured to require or accept the encryption.

However, the VM could not encrypt the traffic to an Internet host that is not configured to require the encryption.

https://docs.microsoft.com/en-us/azure/security/azure-security-data-encryption-best-practices#protect-data-in-transit

Question: 226 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Hybrid Monitoring: Azure Security Center (now Microsoft Defender for Cloud) provides hybrid cloud security posture management. By deploying the Log Analytics / Azure Monitor Agent or connecting via Azure Arc, it assesses and monitors both native Azure workloads and on-premises physical/virtual machines.

Answer Area

Statements	Yes	No
Azure Security Center can monitor Azure resources and on-premises resources.	○	○
All Azure Security Center features are free.	○	○
From Azure Security Center, you can download a Regulatory Compliance report.	○	○

Answer:

Regulatory Compliance Dashboard: The platform includes an integrated Regulatory Compliance dashboard mapping security controls against international standards (e.g., ISO 27001, SOC 2, PCI-DSS, CIS). From this dashboard, administrators can generate and download executive summary reports and detailed compliance assessments.

Answer Area

Statements	Yes	No
Azure Security Center can monitor Azure resources and on-premises resources.	○	○
All Azure Security Center features are free.	○	○
From Azure Security Center, you can download a Regulatory Compliance report.	○	○

Explanation:

Box 1: Yes -

Azure Security Center is a unified infrastructure security management system that strengthens the security posture of your data centers, and provides advanced threat protection across your hybrid workloads in the cloud - whether they're in Azure or not - as well as on premises.

Box 2: No -

Only two features: Continuous assessment and security recommendations, and Azure secure score, are free.

Box 3: Yes -

The advanced monitoring capabilities in Security Center also let you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

Note:- Azure Security Center and Azure Defender are now called Microsoft Defender for Cloud.

References:

https://docs.microsoft.com/en-us/azure/security-center/security-center-intro

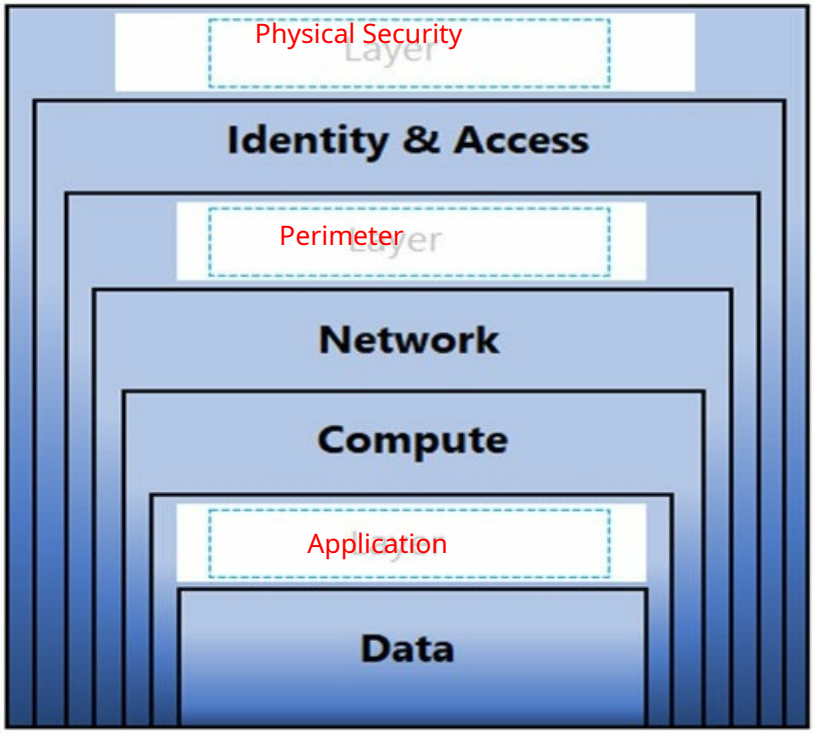

Question: 227 CertyIQ

DRAG DROP -
You need to complete the defense-in-depth strategy used in a datacenter.
What should you do? To answer, drag the appropriate layers to the correct positions in the model. Each layer may be used once, more than once, or not at all.
You may need to drag the split bar between panes or scroll to view content.
NOTE: Each correct selection is worth one point.
Select and Place:

Layers

- Perimeter
- Application
- Physical Security

Answer Area

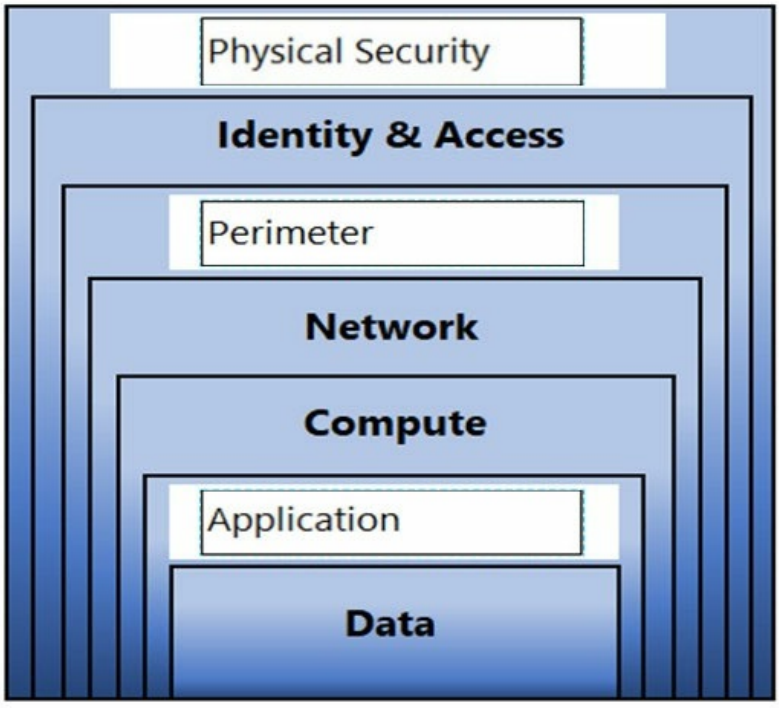

Answer:

Layers

- Perimeter
- Application
- Physical Security

Answer Area

Explanation:

Physical Security (Top)

Identity & Access

Perimeter

Network

Compute

Application

Data (Bottom)

Defence in depth layers (from bottom to top):

✑ Data

- In almost all cases attackers are after data.

- Data can be in database, stored on disk inside VMs, on a SaaS application such as Office 365 or in cloud storage.

- Those storing and controlling access to data to ensures that it's properly secured

- Often regulatory requirements dictates controls & processes

- to ensure confidentiality, integrity, and availability.

✑ Application

- Ensure applications are secure and free of vulnerabilities.

- Store sensitive application secrets in a secure storage medium.

- Make security a design requirement for all application development.

- Integrate security into the application development life cycle.

✑ Compute

- Secure access to virtual machines.

- Implement endpoint protection and keep systems patched and current.

- Malware, unpatched systems, and improperly secured systems open your environment to attacks.

✑ Networking

- Limit communication between resources.

- Deny by default.

- Allow only what is required

- Restrict inbound internet access and limit outbound, where appropriate.

- Implement secure connectivity to on-premises networks.

✑ Perimeter

- Use distributed denial of service (DDoS) protection to filter large-scale attacks before they can cause a denial of service for end users.

- Use perimeter firewalls to identify and alert on malicious attacks against your network.

✑ Identity and access

- Control access to infrastructure and change control.

- Access granted is only what is needed

- Use single sign-on and multi-factor authentication.

- Audit events and changes.

✑ Physical security

- Building security & controlling access to computing hardware.

- First line of defense.

https://github.com/undergroundwires/Azure-in-bullet-points/blob/master/AZ-900%20Microsoft%20Azure%20Fundamentals/4.2.%20Defence%20in%20Depth.md

Question: 228 CertyIQ

You have an Azure virtual machine named VM1.
You plan to encrypt VM1 by using Azure Disk Encryption.
Which Azure resource must you create first?

Prerequisites for Azure Disk Encryption (ADE): Azure Disk Encryption relies on OS-level encryption tools—BitLocker for Windows VMs and DM-Crypt for Linux VMs—to protect OS and data disks.

A. an Azure Storage account
B. an Azure Key Vault
C. an Azure Information Protection policy
D. an Encryption key

To safeguard and control the cryptographic keys and secrets that BitLocker/DM-Crypt generate, ADE integrates directly with Azure Key Vault.

Before enabling Azure Disk Encryption on any virtual machine, you must create or have an existing Azure Key Vault enabled with the appropriate access policies/permissions for disk encryption (--enabled-for-disk-encryption in Azure CLI or PowerShell). You cannot generate or store an encryption key without having the container resource—the Key Vault—created first.

Answer: B

Explanation:
Azure Disk Encryption requires an Azure Key Vault to control and manage disk encryption keys and secrets.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-machines/windows/disk-encryption-overview

Question: 229 CertyIQ

Which resources can be used as a source for a Network security group inbound security rule?

A. Service Tags only
B. IP Addresses, Service tags and Application security groups
C. Application security groups only
D. IP Addresses only

Network Security Group (NSG) Rule Schema: When defining an inbound or outbound security rule in an NSG, Azure requires specifying a Source and a Destination.

Azure Supports three source types
+ IP Address: Individual IPv4/IPv6 addresses or classess CIDR ranges
+ Service Tags: A predefined group IP address prefixes managed directly by Microsoft representing specific services:
+ Application Security Groups (ASGs): A logical grouping of virtual machine network interfaces (NICs) allowing you to define network security policies based on application structure.

Answer: B

Explanation:

Source or destination:

Any, or an individual IP address, classless inter-domain routing (CIDR) block (10.0.0.0/24, for example), service tag, or application security group.

Network security groups are processed after Azure translates a public IP address to a private IP address for inbound traffic, and before Azure translates a private IP address to a public IP address for outbound traffic. .

Specifying a range, a service tag, or application security group, enables you to create fewer security rules.

https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview#security-rules

Reference:

https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview

Question: 230 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Azure Sentinel uses playbooks to

- automatically respond to threats.
- collect data from Azure services.
- specify how long data is retained.
- store passwords and certificates.

Answer:

Answer Area

Azure Sentinel uses playbooks to

- automatically respond to threats.
- collect data from Azure services.
- specify how long data is retained.
- store passwords and certificates.

Explanation:

Playbooks are collections of procedures that can be run from Azure Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively. It can also be run manually on-demand.

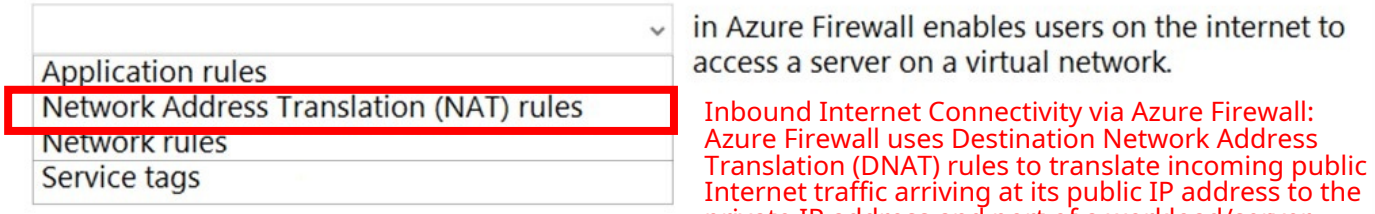

Reference:

https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook

Question: 231 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Inbound Internet Connectivity via Azure Firewall: Azure Firewall uses Destination Network Address Translation (DNAT) rules to translate incoming public Internet traffic arriving at its public IP address to the private IP address and port of a workload/server inside a Virtual Network (VNet).

Answer:

When a NAT rule is configured, Azure Firewall implicitly generates a corresponding network rule to permit the translated traffic through, enabling external Internet clients to access internal virtual network servers without exposing the internal server's private IP directly to the Internet.

Answer Area

Explanation:

If you configure network rules and application rules, then network rules are applied in priority order before application rules.

NAT rules are applied in priority before network rules.

https://docs.microsoft.com/en-us/azure/firewall/rule-processing

Reference:

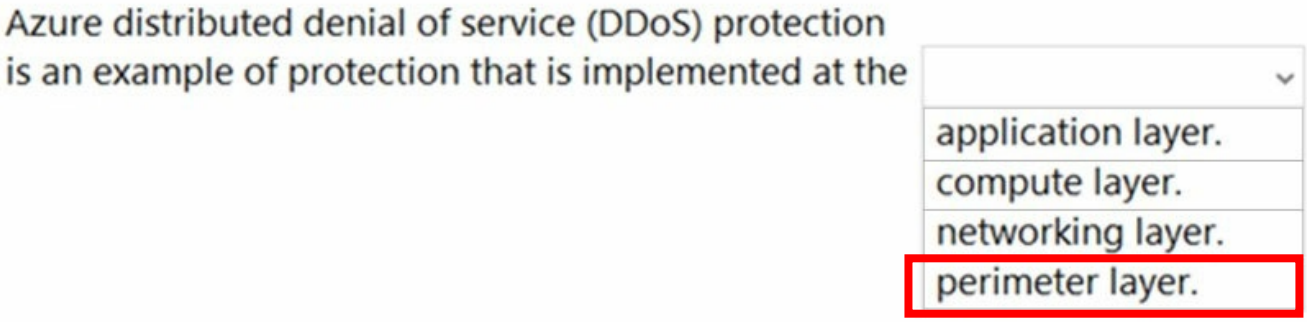

https://docs.microsoft.com/en-us/azure/firewall/tutorial-firewall-dnat-policy

Question: 232

CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Answer:

Defense in Depth Framework: In Microsoft's Defense in Depth layered security model, the perimeter layer protects an organization's network boundaries against large-scale external network attacks before they reach internal cloud infrastructure

Answer Area

Azure distributed denial of service (DDoS) protection is an example of protection that is implemented at the

- application layer.
- compute layer.
- networking layer.
- perimeter layer.

Explanation:

"The perimeter layer uses distributed denial of service (DDoS) protection to filter large-scale attacks before they can cause a denial of service for users."

https://docs.microsoft.com/en-us/learn/modules/secure-network-connectivity-azure/2-what-is-defense-in-depth

Question: 233 CertyIQ

You have an Azure Sentinel workspace.
You need to automate responses to threats detected by Azure Sentinel.
What should you use?

A. adaptive network hardening in Azure Security Center
B. Azure Service Health
C. Azure Monitor workbooks
D. adaptive application controls in Azure Security Center

Playbooks and Automation Rules

Built using Azure Logic Apps

Threat Automation in Microsoft Sentinel: To automate and orchestrate responses to threats detected by Sentinel, you use Playbooks (built on the foundation of Azure Logic Apps) and Automation Rules. A playbook contains a collection of automated remediation actions (such as blocking an IP address, revoking user sessions, or opening a ServiceNow ticket) that execute automatically when an incident or alert triggers.

Answer: C

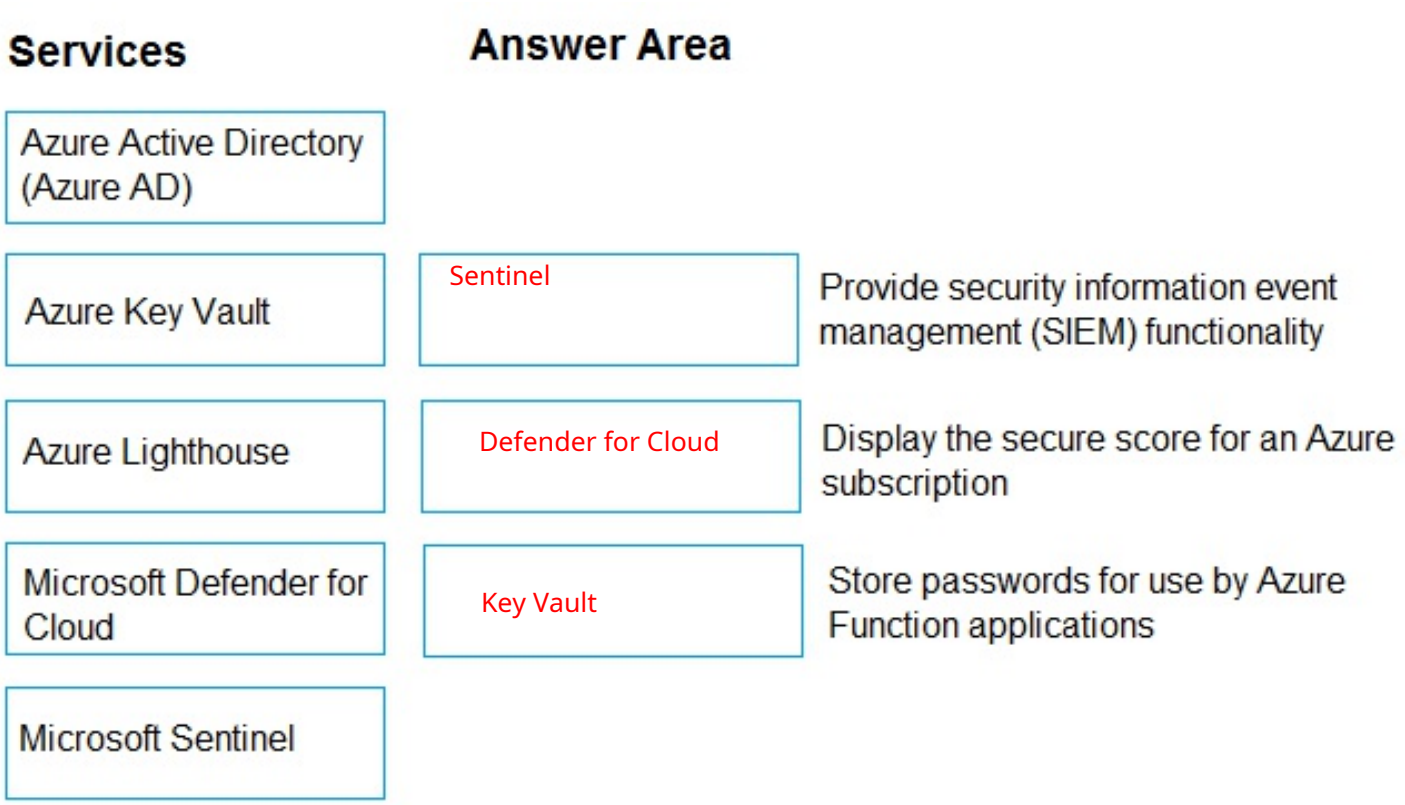

Explanation:

Once you have connected your data sources to Microsoft Sentinel, you can visualize and monitor the data using the Microsoft Sentinel adoption of Azure Monitor Workbooks, which provides versatility in creating custom dashboards. While the Workbooks are displayed differently in Microsoft Sentinel, it may be useful for you to see how to create interactive reports with Azure Monitor Workbooks. Microsoft Sentinel allows you to create custom workbooks across your data, and also comes with built-in workbook templates to allow you to quickly gain insights across your data as soon as you connect a data source.

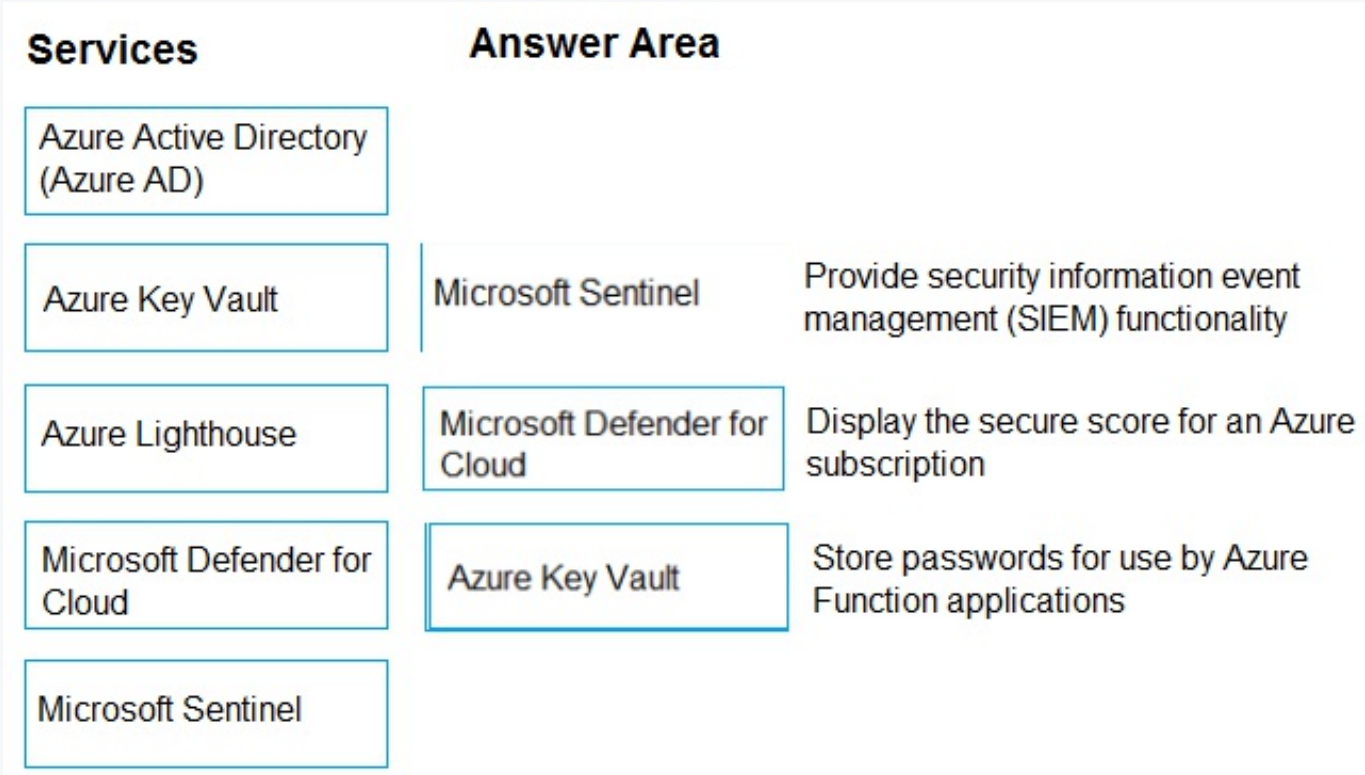

https://docs.microsoft.com/en-us/azure/sentinel/monitor-your-data

Question: 234 CertyIQ

DRAG DROP -
Match the Azure services benefits to the correct descriptions.
Instructions: To answer, drag the appropriate benefit from the column on the left to its description on the right.
Each benefit may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer:

Explanation:

Box 1: Microsoft Sentinel -

Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution. Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Box 2: Microsoft Defender for Cloud

You can find your overall secure score, as well as your score per subscription, through the Azure portal. Defender for Cloud displays your secure score prominently in the portal.

Box 3: Azure Key Vault -
A favored approach to store the credentials or keys in the Azure Key Vault as secrets and reference the secrets as environment variables in our Azure functions apps.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/overview
https://docs.microsoft.com/en-us/azure/defender-for-cloud/secure-score-access-and-track
https://levelup.gitconnected.com/a-secure-way-to-use-credentials-and-secrets-in-azure-functions-7ec91813c807

Question: 235 CertyIQ

Which Azure service can you use as a security information and event management (SIEM) solution?

A. Azure Analysis Services
B. Microsoft Sentinel
C. Azure Information Protection
D. Azure Cognitive Services

Answer: B

Explanation:
Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution. Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/overview

Question: 236 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

An Azure Policy initiative definition is a [▼]
- collection of policy definitions.
- collection of Azure Policy definition assignments.
- group of Azure Blueprints definitions.
- group of role-based access control (RBAC) role assignments.

Answer: Azure Policy Initiatives: An initiative definition (also called a policy set) is an Azure governance construct that groups multiple individual policy definitions together into a single logical unit.

Grouping policies into an initiative simplifies managing and tracking compliance toward a single overarching goal (such as regulatory compliance standards like ISO 27001 or cost governance) across subscriptions, resource groups, or management groups through a single assignment.

Answer Area

An Azure Policy initiative definition is a [collection of policy definitions. | collection of Azure Policy definition assignments. | group of Azure Blueprints definitions. | group of role-based access control (RBAC) role assignments.]

Explanation:

Box: collection of policy definitions

An Azure Policy initiative is a collection of Azure Policy definitions, or rules, that are grouped together towards a specific goal or purpose. Azure initiatives simplify management of your policies by grouping a set of policies together, logically, as a single item.

"collect of policy definitions" is the answer.

https://learn.microsoft.com/en-us/azure/governance/policy/overview#initiative-definition

An initiative definition is a collection of policy definitions that are tailored toward achieving a singular overarching goal. Initiative definitions simplify managing and assigning policy definitions. They simplify by grouping a set of policies as one single item. For example, you could create an initiative titled Enable Monitoring in Microsoft Defender for Cloud, with a goal to monitor all the available security recommendations in your Microsoft Defender for Cloud instance.

Reference:

https://docs.microsoft.com/en-us/azure/defender-for-cloud/security-policy-concept

Question: 237

CertyIQ

You have an Azure subscription.
You need to review your secure score.
What should you use?

A. Azure Monitor
B. Azure Advisor
C. Help + support
D. Microsoft Defender for Cloud

Answer: D

Explanation:

The central feature in Defender for Cloud that enables you to achieve those goals is secure score.

Microsoft Defender for Cloud has two main goals:

- to help you understand your current security situation

- to help you efficiently and effectively improve your security

The central feature in Defender for Cloud that enables you to achieve those goals is the secure score.

Defender for Cloud continually assesses your cross-cloud resources for security issues. It then aggregates all the findings into a single score so that you can tell, at a glance, your current security situation: the higher the score, the lower the identified risk level.

Reference:

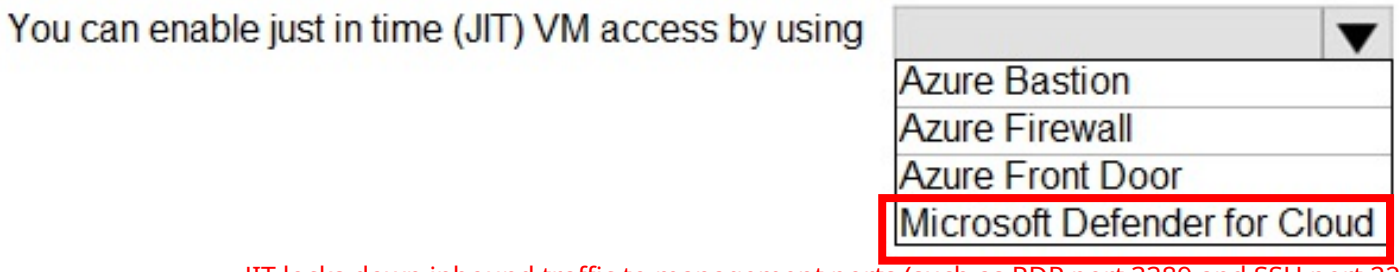

https://docs.microsoft.com/en-us/azure/defender-for-cloud/secure-score-security-controls

Question: 238 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Just-in-Time (JIT) VM Access: A security feature provided under Microsoft Defender for Cloud (specifically part of the Defender for Servers plan, formerly Azure Security Center standard tier).

JIT locks down inbound traffic to management ports (such as RDP port 3389 and SSH port 22) by modifying Network Security Group (NSG) and Azure Firewall rules to deny inbound access by default. When an authorized user requests access, Defender for Cloud temporarily enables an inbound rule for that user's IP address for a specific, time-limited window before automatically closing it again.

Answer:

Answer Area

Explanation:
Box: Microsoft Defender for Cloud
Lock down inbound traffic to your Azure Virtual Machines with Microsoft Defender for Cloud's just-in-time (JIT) virtual machine (VM) access feature. This reduces exposure to attacks while providing easy access when you need to connect to a VM.

Reference:
https://docs.microsoft.com/en-us/azure/defender-for-cloud/just-in-time-access-usage

Question: 239 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Microsoft Defender for Cloud

Answer:

Regulatory Compliance Dashboard: Microsoft Defender for Cloud (formerly Azure Security Center) includes a dedicated Regulatory Compliance dashboard.

This dashboard maps your deployed cloud resources against specific industry standards and regulatory compliance frameworks (such as ISO 27001, SOC 2, HIPAA, PCI-DSS, and CIS benchmarks).

From this dashboard, organizations can review their compliance state, remediate failed controls, and directly generate/download downloadable compliance summary reports reflecting their tenant's specific cloud security posture.

Answer Area

You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Microsoft Defender for Cloud

Explanation:

Box: Microsoft Defender for Cloud

Microsoft Defender for Cloud helps streamline the process for meeting regulatory compliance requirements, using the regulatory compliance dashboard.

You can download PDF/CSV reports as well as certification reports of your compliance status.

Reference:

https://docs.microsoft.com/en-us/azure/defender-for-cloud/regulatory-compliance-dashboard

Question: 240 CertyIQ

You need to collect and automatically analyze security events from Azure Active Directory (Azure AD).
What should you use?

- A. Microsoft Sentinel
- B. Azure Synapse Analytics
- C. Azure AD Connect
- D. Azure Key Vault

SIEM & Identity Telemetry Analysis: Microsoft Sentinel is Microsoft's cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automation, and Response (SOAR) platform. Microsoft Sentinel provides native, out-of-the-box data connectors for Azure Active Directory (Microsoft Entra ID) to ingest sign-in logs, audit logs, and identity protection events.Once collected, Sentinel uses built-in machine learning, user and entity behavior analytics (UEBA), and correlation analytics rules to automatically detect and analyze threats across your identity estate.

Answer: A

Explanation:

Microsoft Sentinel is a scalable, cloud-native, security information and event management (SIEM) and security orchestration, automation, and response (SOAR) solution.

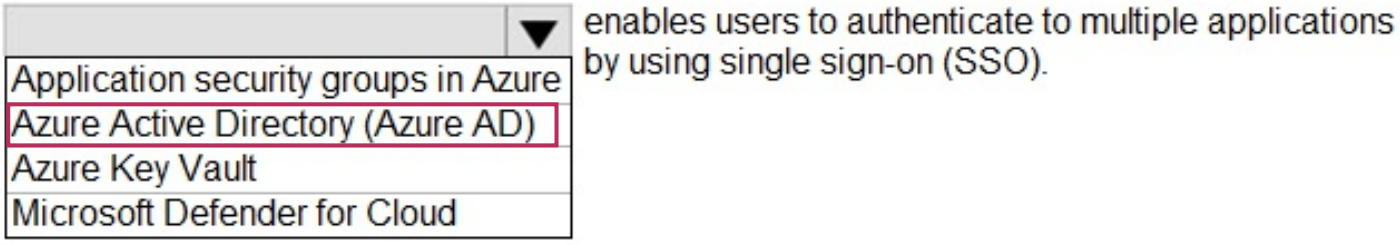

Microsoft Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for attack detection, threat visibility, proactive hunting, and threat response.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/overview

Question: 241 CertyIQ

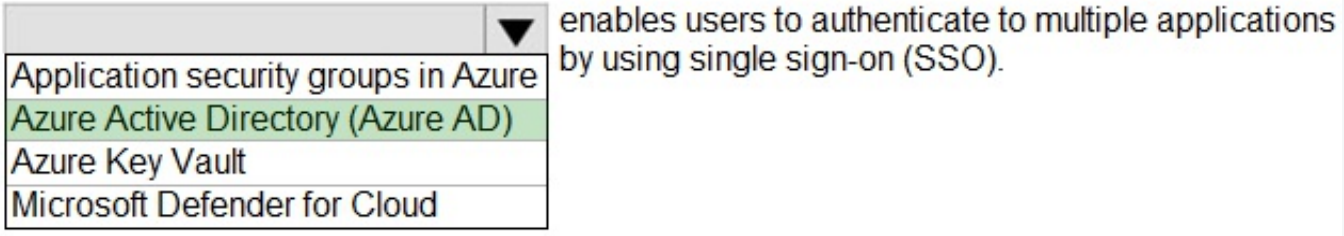

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:
Box: Azure Active Directory (Azure AD)
You can enable single sign-on for an enterprise application through Azure Active Directory (Azure AD.
Incorrect:
Application security groups enable you to configure network security as a natural extension of an application's structure, allowing you to group virtual machines and define network security policies based on those groups.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/manage-apps/add-application-portal-setup-sso

Question: 242 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 3 (Yes): When created, an NSG always includes default security rules (3 default inbound rules and 3 default outbound rules). These default rules cannot be deleted (only overridden with higher-priority rules with lower numerical values), so an NSG invariably contains both inbound and outbound rules.

Answer Area

Statement 2 (Yes): Application Security Groups (ASGs) enable you to group virtual machines and define network security policies based on those workloads (e.g., "WebServers", "DBServers") rather than explicit IP addresses. You can reference an ASG as the Source or Destination inside an NSG inbound or outbound security rule.

Statements	Yes	No
A network security group (NSG) will block all network traffic by default.	○	○
Application security groups can be specified as part of network security group (NSG) rules.	○	○
Network security groups (NSGs) always include inbound security rules and outbound security rules.	○	○

Statement 1 (No): Network Security Groups (NSGs) do not block all traffic by default. Every NSG contains built-in default security rules that permit specific baseline traffic:

Inbound: Allows all intra-virtual network traffic (AllowVnetInBound) and Azure load balancer health probes (AllowAzureLoadBalancerInBound). Only all other inbound traffic from the internet/external sources is denied (DenyAllInBound).

Outbound: Allows all traffic within the virtual network (AllowVnetOutBound) as well as all outbound traffic directly to the Internet (AllowInternetOutBound).

Answer:

Answer Area

Statements	Yes	No
A network security group (NSG) will block all network traffic by default.	○	○
Application security groups can be specified as part of network security group (NSG) rules.	○	○
Network security groups (NSGs) always include inbound security rules and outbound security rules.	○	○

Explanation:

Box 1: No -
Azure creates the default rules in each network security group that you create. These rules allow some traffic.

Box 2: Yes -
A network security group contains zero, or as many rules as desired. These rules can refer to application security groups.

Box 3: Yes -
Azure creates the Inbound and OutBound default rules in each network security group that you create.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview

Question: 243 CertyIQ

DRAG DROP -
Match the term to the appropriate description.
To answer, drag the appropriate term from the column on the left to its description on the right. Each term may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Terms	Answer Area	
authorization	single-sign-on (SSO)	The ability to use the same credentials to access multiple resources and applications from different providers.
multi-factor authentication (MFA)	authorization	The process of identifying the access level of a user or service.
single sign-on (SSO)	multi-factor authentication (MFA)	Requires several elements to identify a user or a service.

Answer:

Terms	Answer Area	
authorization	single sign-on (SSO)	The ability to use the same credentials to access multiple resources and applications from different providers.
multi-factor authentication (MFA)	authorization	The process of identifying the access level of a user or service.
single sign-on (SSO)	multi-factor authentication (MFA)	Requires several elements to identify a user or a service.

Explanation:

Single sign-on (SSO) >> The ability to use the same credentials to access multiple resources and applications from different providers

Authentication >> The process of identifying the access level of a user or service

Multi-factor authentication(MFA) - Requires several elements to identify a user or a service

Question: 244 CertyIQ

Your company plans to automate the deployment of servers to Azure.
Your manager is concerned that you may expose administrative credentials during the deployment.
You need to recommend an Azure solution that encrypts the administrative credentials during the deployment.
What should you include in the recommendation?

A. Azure Key Vault
B. Azure Information Protection
C. Microsoft Defender for Cloud
D. Azure Multi-Factor Authentication (MFA)

Answer: A

Explanation:
Azure Key Vault protects cryptographic keys, certificates (and the private keys associated with the certificates), and secrets (such as connection strings and passwords) in the cloud.

Reference:
https://docs.microsoft.com/en-us/azure/key-vault/general/security-features

Question: 245 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

After you create a virtual machine, you need to modify the _____ to allow connections to TCP port 8080 on the virtual machine

- network security group (NSG)
- virtual network gateway
- virtual network
- route table

Answer:

Answer Area

After you create a virtual machine, you need to modify the _____ to allow connections to TCP port 8080 on the virtual machine

- network security group (NSG)
- virtual network gateway
- virtual network
- route table

Explanation:
Box: network Security group (NSG)
You can use an Azure network security group to filter network traffic to and from Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. For each rule, you can specify source and destination, port, and protocol.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview

Question: 246 CertyIQ

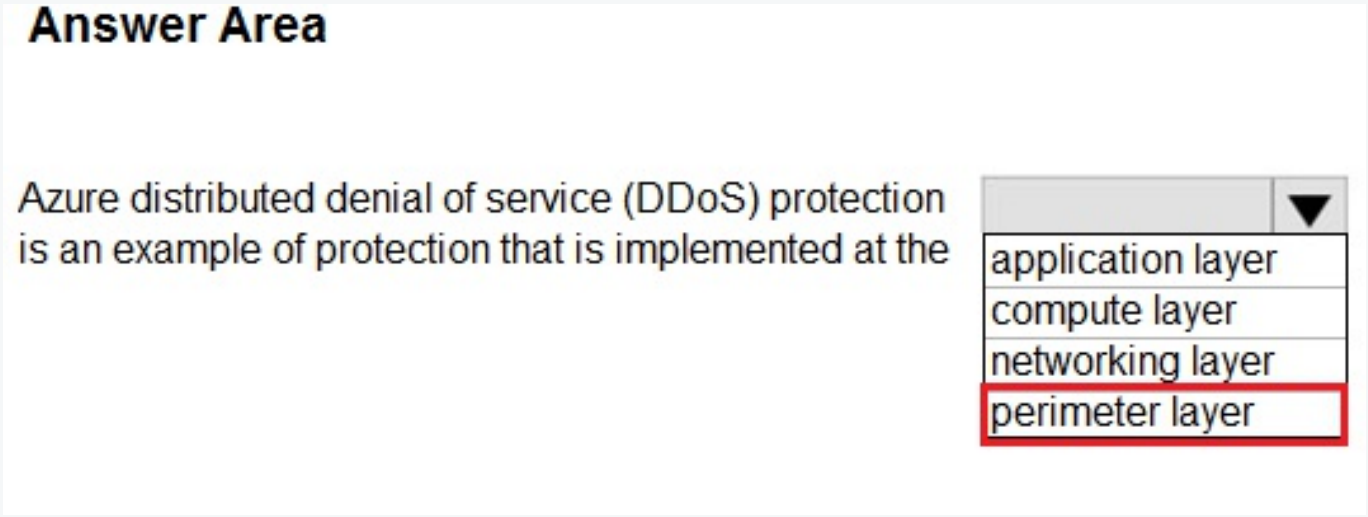

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure distributed denial of service (DDoS) protection is an example of protection that is implemented at the

- application layer
- compute layer
- networking layer
- perimeter layer

Answer:

Explanation:

Perimeter layer.

https://learn.microsoft.com/en-us/training/modules/secure-network-connectivity-azure/2-what-is-defense-in-depth

Question: 247

CertyIQ

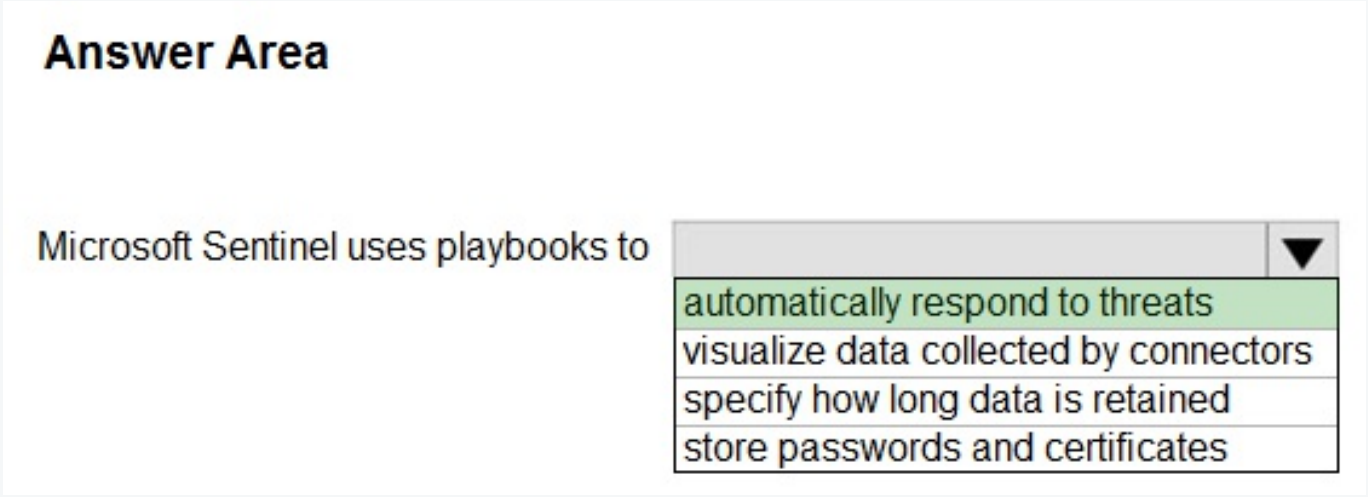

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Microsoft Sentinel uses playbooks to

- automatically respond to threats
- visualize data collected by connectors
- specify how long data is retained
- store passwords and certificates

Answer:

Explanation:

Box: automatically respond to threats

Playbooks are collections of procedures that can be run from Microsoft Sentinel in response to an alert or incident. A playbook can help automate and orchestrate your response, and can be set to run automatically when specific alerts or incidents are generated, by being attached to an analytics rule or an automation rule, respectively.

Note: Automation rules help you triage incidents in Microsoft Sentinel. You can use them to automatically assign incidents to the right personnel, close noisy incidents or known false positives, change their severity, and add tags. They are also the mechanism by which you can run playbooks in response to incidents.

Reference:
https://docs.microsoft.com/en-us/azure/sentinel/tutorial-respond-threats-playbook

Question: 248 CertyIQ

You need to configure an Azure solution that meets the following requirements:
- Secures websites from attacks
- Generates reports that contain details of attempted attacks

What should you include in the solution?

A. Azure Firewall
B. a network security group (NSG)
C. Azure Information Protection
D. DDoS protection

Azure DDoS Protection (formerly DDoS Protection Standard / Network Protection) monitors traffic directed at Azure public IP addresses and mitigates volumetric and protocol DDoS attacks targeting websites and public endpoints.

A core differentiator tested in this question is reporting capability: Azure DDoS Protection provides DDoS Attack Analytics, real-time telemetry metrics via Azure Monitor, and detailed post-attack mitigation reports detailing the attack vectors, duration, throughput, and dropped traffic packets.

A. Azure Firewall: While Azure Firewall provides stateful packet inspection, threat intelligence-based filtering, and application FQDN filtering, it outputs diagnostic log streams to Log Analytics rather than turnkey, structured attack reports specific to website attack incidents. In Microsoft's classic exam key distribution for this exact item, DDoS protection is the designated answer due to its built-in attack reporting suite.

Answer: D

Explanation:

Attack is the Key word for DDOS.

Rules is keyword for Firewall.

Allow/Deny is the Keyword for NSG

DDoS is a type of attack that tries to exhaust application resources. The goal is to affect the application's availability and its ability to handle legitimate requests.

DDoS attacks can be targeted at any endpoint that is publicly reachable through the internet.

Azure has two DDoS service offerings that provide protection from network attacks: DDoS Protection Basic and DDoS Protection Standard.

DDoS Basic protection is integrated into the Azure platform by default and at no extra cost.

You have the option of paying for DDoS Standard. It has several advantages over the basic service, including logging, alerting, and telemetry. DDoS Standard can generate reports that contain details of attempted attacks as required in this question.

Reference:

https://docs.microsoft.com/en-us/azure/security/fundamentals/ddos-best-practices

Question: 249

CertyIQ

HOTSPOT -
You plan to implement several security services for an Azure environment. You need to identify which Azure services must be used to meet the following security requirements:
- Monitor threats by using sensors
- Enforce Azure Multi-Factor Authentication (MFA) based on a condition

Which Azure service should you identify for each requirement? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Monitor threats by using sensors:

- Azure Monitor
- Azure Security Center
- Azure Active Directory (Azure AD) Identity Protection
- Azure Advanced Threat Protection (ATP)

Azure Advanced Threat Protection (ATP / Defender for Identity):Azure ATP monitors on-premises Active Directory domain controllers for suspicious activity, credential harvesting, lateral movement, and advanced persistent threats. It accomplishes this specifically through Azure ATP sensors (installed directly onto domain controllers or deployed as standalone sensors capturing mirrored network traffic).

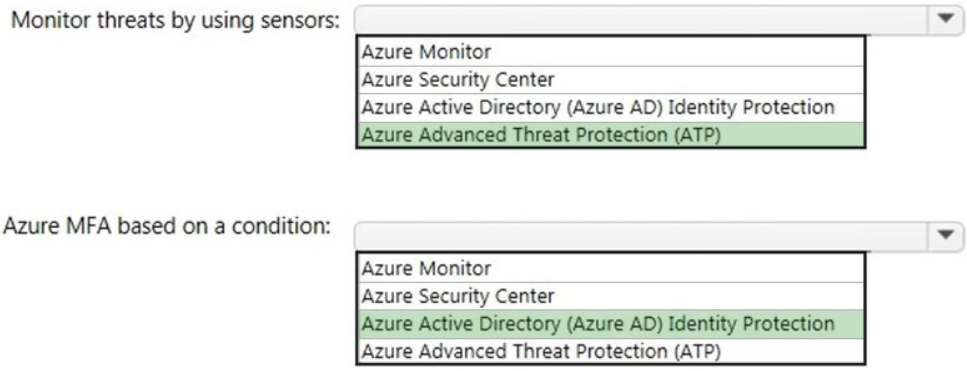

Enforce Azure MFA based on a condition:

- Azure Monitor
- Azure Security Center
- Azure Active Directory (Azure AD) Identity Protection
- Azure Advanced Threat Protection (ATP)

Azure Active Directory (Azure AD) Identity Protection (Microsoft Entra ID Protection): Identity Protection detects identity-based risks and automates remediation. It integrates directly with Conditional Access to evaluate conditions—specifically user risk (e.g., leaked credentials) and sign-in risk (e.g., unfamiliar location, impossible travel, anonymous IP address)—to conditionally enforce Multi-Factor Authentication (MFA) or trigger self-service password resets.

Answer:

Answer Area

Explanation:

Box 1:

To monitor threats by using sensors, you would use Azure Advanced Threat Protection (ATP).

Azure Advanced Threat Protection (ATP) is a cloud-based security solution that leverages your on-premises Active Directory signals to identify, detect, and investigate advanced threats, compromised identities, and malicious insider actions directed at your organization.

Sensors are software packages you install on your servers to upload information to Azure ATP.

Box 2:

To enforce MFA based on a condition, you would use Azure Active Directory Identity Protection.

Azure AD Identity Protection helps you manage the roll-out of Azure Multi-Factor Authentication (MFA) registration by configuring a Conditional Access policy to require MFA registration no matter what modern authentication app you are signing in to.

Reference:

https://docs.microsoft.com/en-us/azure-advanced-threat-protection/what-is-atp

https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-identity-protection-configure-mfa-policy

Question: 250

CertyIQ

Your Azure environment contains multiple Azure virtual machines.

You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.

What are two possible solutions? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

A. Modify an Azure Traffic Manager profile

B. Modify a network security group (NSG)

C. Modify a DDoS protection plan

D. Modify an Azure firewall

Inbound Access Control: By default, Azure virtual networks block unsolicited inbound traffic from the public Internet via default security rules (DenyAllInBound). To permit external HTTP traffic (TCP port 80) to reach a virtual machine, an administrator must explicitly configure an inbound allow rule on a traffic-filtering boundary:

Network Security Group (NSG): Creating an inbound security rule allowing traffic on Destination Port 80 (HTTP) associated with VM1's Network Interface (NIC) or its subnet will permit internet traffic to reach the VM.

Answer: BD

Explanation:

Azure Firewall: In architectures where centralized network inspection is configured, adding a DNAT (Destination Network Address Translation) rule or Network/Application rule in Azure Firewall allows incoming HTTP traffic from the public Internet to be routed directly to VM1's private IP address

Question saying there should be 2 answer, not just one as given in the solution.

B (NSG) and D (Firewall)

A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.

You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.

You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

Reference:

https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 251 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

You can enable just in time (JIT) VM access by using

- Azure Bastion
- Azure Firewall
- Azure Front Door
- Azure Security Center

Just-in-Time (JIT) VM Access: JIT access locks down inbound management ports (such as RDP port 3389 and SSH port 22) on virtual machines by configuring Network Security Group (NSG) rules that deny all inbound traffic by default.

When an authorized user requests access, Azure Security Center (now Microsoft Defender for Cloud, specifically Defender for Servers) verifies the user's role-based permissions (Azure RBAC), dynamically creates a high-priority allow rule on the NSG for only the requester's IP address, and automatically revokes that rule when the requested time window expires.

Answer:

Answer Area

You can enable just in time (JIT) VM access by using

- Azure Bastion
- Azure Firewall
- Azure Front Door
- Azure Security Center

Explanation:

"Azure Security Center" is the answer, and it has been renamed to **Microsoft Defender for Cloud.**

https://learn.microsoft.com/en-us/azure/defender-for-cloud/just-in-time-access-usage

You can use Microsoft Defender for Cloud's just-in-time (JIT) access to protect your Azure virtual machines (VMs) from unauthorized network access. Many times firewalls contain allow rules that leave your VMs

vulnerable to attack. JIT lets you allow access to your VMs only when the access is needed, on the ports needed, and for the period of time needed.

Reference:

https://docs.microsoft.com/en-us/azure/security-center/security-center-just-in-time?tabs=jit-config-asc%2Cjit-request-asc

Question: 252 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

An NSG cannot be assigned directly to an entire Virtual Network (VNet). Traffic boundaries and subnet segmentations within a VNet require associations at the subnet or NIC level.

Statements	Yes	No
You can associate a network security group (NSG) to a virtual network subnet.	◯	◯
You can associate a network security group (NSG) to a virtual network.	◯	◯
You can associate a network security group (NSG) to a network interface.	◯	◯

According to Microsoft Virtual Network architecture rules, an NSG can be linked to exactly two scopes:

Answer:

Subnet: Linking an NSG at the subnet level applies the defined security filtering rules to all resources deployed within that subnet.

Answer Area

Network Interface (NIC): Linking an NSG directly to a virtual machine's NIC applies the filtering rules specifically to that individual network card.

Statements	Yes	No
You can associate a network security group (NSG) to a virtual network subnet.	◯	◯
You can associate a network security group (NSG) to a virtual network.	◯	◯
You can associate a network security group (NSG) to a network interface.	◯	◯

Explanation:

Box 1 - Yes

Box 2 - No

“You can associate zero, or one, network security group to each virtual network subnet and network interface

in a virtual machine. The same network security group can be associated to as many subnets and network interfaces as you choose."

References: https://docs.microsoft.com/en-us/azure/virtual-network/network-security-group-how-it-works

Note: It clearly says it must be either a subnet (not a virtual network) or a NIC.

Box 3 - Yes

Reference:

https://docs.microsoft.com/en-us/azure/virtual-network/network-security-group-how-it-works

Question: 253 CertyIQ

You have an Azure environment that contains 10 virtual networks and 100 virtual machines.
You need to limit the amount of inbound traffic to all the Azure virtual networks.
What should you create?

A. one application security group (ASG)
B. 10 virtual network gateways
C. 10 Azure ExpressRoute circuits
D. one Azure firewall

Centralized Network Security Architecture (Hub-and-Spoke): Microsoft recommends deploying a hub-and-spoke network topology to manage security across multiple virtual networks centrally.

In this architecture, one Azure Firewall is provisioned within a dedicated subnet (AzureFirewallSubnet) inside the central "hub" VNet. All 10 virtual networks ("spokes") are connected to this hub via Virtual Network Peering, with User-Defined Routes (UDRs) directing all inbound internet traffic through the single Azure Firewall for stateful inspection and filtering before reaching any of the 100 virtual machines.

Answer: D

Explanation:
You can restrict traffic to multiple virtual networks with a single Azure firewall.
Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.
You can centrally create, enforce, and log application and network connectivity policies across subscriptions and virtual networks. Azure Firewall uses a static public IP address for your virtual network resources allowing outside firewalls to identify traffic originating from your virtual network.

Reference:
https://docs.microsoft.com/en-us/azure/firewall/overview

Question: 254 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
Azure Key Vault is used to store secrets for Azure Active Directory (Azure AD) user accounts.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed
B. Azure Active Directory (Azure AD) administrative accounts
C. Personally Identifiable Information (PII)
D. server applications

Azure Key Vault Purpose: Azure Key Vault is a centralized cloud service for securely storing and accessing sensitive programmatic data, specifically Secrets (API keys, database connection strings, passwords), Keys (cryptographic encryption keys, HSM-backed), and Certificates (X.509 certificates).

Answer: D

Application Identity Integration: Server applications (such as Azure App Services, VMs, Azure Functions, or containerized services) authenticate to Azure Key Vault using managed identities or service principals to retrieve application secrets at runtime. This avoids embedding plaintext credentials, database passwords, or API keys directly in source code or configuration files.

Explanation:

https://learn.microsoft.com/en-us/azure/key-vault/general/overview#why-use-azure-key-vault

Centralizing storage of application secrets in Azure Key Vault allows you to control their distribution. Key Vault greatly reduces the chances that secrets may be accidentally leaked. When application developers use Key Vault, they no longer need to store security information in their application. Not having to store security information in applications eliminates the need to make this information part of the code. For example, an application may need to connect to a database. Instead of storing the connection string in the app's code, you can store it securely in Key Vault.

Your applications can securely access the information they need by using URIs. These URIs allow the applications to retrieve specific versions of a secret. There's no need to write custom code to protect any of the secret information stored in Key Vault.

Reference:

https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/

Question: 255 CertyIQ

Your company plans to automate the deployment of servers to Azure.
Your manager is concerned that you may expose administrative credentials during the deployment.
You need to recommend an Azure solution that encrypts the administrative credentials during the deployment.
What should you include in the recommendation?

A. Azure Key Vault
B. Azure Information Protection
C. Azure Security Center
D. Azure Multi-Factor Authentication (MFA)

Answer: A

Explanation:
Azure Key Vault is a secure store for storage various types of sensitive information. In this question, we would store the administrative credentials in the Key Vault.
With this solution, there is no need to store the administrative credentials as plain text in the deployment scripts.
All information stored in the Key Vault is encrypted.
Azure Key Vault can be used to Securely store and tightly control access to tokens, passwords, certificates, API keys, and other secrets.
Secrets and keys are safeguarded by Azure, using industry-standard algorithms, key lengths, and hardware security modules (HSMs). The HSMs used are
Federal Information Processing Standards (FIPS) 140-2 Level 2 validated.
Access to a key vault requires proper authentication and authorization before a caller (user or application) can get access. Authentication establishes the identity of the caller, while authorization determines the operations that they are allowed to perform.

Reference:
https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview

Question: 256 CertyIQ

You plan to deploy several Azure virtual machines.
You need to control the ports that devices on the Internet can use to access the virtual machines.
What should you use?

A. a network security group (NSG)
B. an Azure Active Directory (Azure AD) role
C. an Azure Active Directory group
D. an Azure key vault

Answer: A

Explanation:
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 257 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

After you create a virtual machine, you need to modify the [network security group (NSG) / virtual network gateway / virtual network / route table] to allow connections to TCP port 8080 on the virtual machine.

Answer:

Answer Area

After you create a virtual machine, you need to modify the [network security group (NSG) / virtual network gateway / virtual network / route table] to allow connections to TCP port 8080 on the virtual machine.

Explanation:
When you create a virtual machine, the default setting is to create a Network Security Group attached to the network interface assigned to a virtual machine.
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.
In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 8080.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 258 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can create custom Azure roles to control access to resources.	○	○
A user account can be assigned to multiple Azure roles.	○	○
A resource group can have the Owner role assigned to multiple users.	○	○

Answer: Statement 1 (Yes): Azure role-based access control (Azure RBAC) includes dozens of built-in roles (e.g., Owner, Contributor, Reader), but if these do not meet the specific security needs of your organization, you can define Azure custom roles using JSON with granular Actions, NotActions, DataActions, and AssignableScopes.

Statement 2 (Yes): Azure RBAC allows assigning multiple roles to a single security principal (user, group, or service principal) across the same scope or different scopes. When multiple roles are assigned, Azure evaluates permissions cumulatively—the user's effective permissions are the sum of their allowed actions across all assigned roles (unless explicitly restricted by a DenyAssignment).

Statement 3 (Yes): Azure does not enforce a single-owner restriction. You can assign the built-in Owner role to multiple users (or groups) on a single resource group to provide administrative redundancy and ensure continuous governance.

Answer Area

Statements	Yes	No
You can create custom Azure roles to control access to resources.	○	○
A user account can be assigned to multiple Azure roles.	○	○
A resource group can have the Owner role assigned to multiple users.	○	○

Explanation:

Yes

Yes

Yes

Yes, in Azure, a resource group can have the Owner role assigned to multiple users. The Owner role is a built-in role in Azure that provides full access to all resources in a resource group, including the ability to create, modify, and delete resources.

When you assign the Owner role to a user or group, it grants them full access to all resources within the resource group. Multiple users or groups can be assigned the Owner role for a resource group, which allows for collaboration and delegation of responsibilities among different teams or individuals.

It's important to note that assigning the Owner role to multiple users or groups can increase the risk of accidental or intentional changes to resources within the resource group. Therefore, it's recommended to carefully consider the access needs of each user or group and assign roles accordingly to minimize the risk of unauthorized access or accidental changes.

Question: 259 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify a network security group (NSG).
Does this meet the goal?

A. Yes
B. No

Answer: A

Explanation:
A network security group works like a firewall. You can attach a network security group to a virtual network and/or individual subnets within the virtual network.
You can also attach a network security group to a network interface assigned to a virtual machine. You can

use multiple network security groups within a virtual network to restrict traffic between resources such as virtual machines and subnets.
You can filter network traffic to and from Azure resources in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources.
In this question, we need to add a rule to the network security group to allow the connection to the virtual machine on port 80 (HTTP).

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/security-overview

Question: 260 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify a DDoS protection plan.
Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
DDoS is a form of attack on a network resource. A DDoS protection plan is used to protect against DDoS attacks; it does not provide connectivity to a virtual machine.
To ensure that a virtual machine named VM1 is accessible from the Internet over HTTP, you need to modify a network security group or Azure Firewall.

Reference:
https://docs.microsoft.com/en-us/azure/virtual-network/ddos-protection-overview

Question: 261 CertyIQ

You need to collect and automatically analyze security events from Azure Active Directory (Azure AD).
What should you use?

A. Azure Sentinel
B. Azure Synapse Analytics
C. Azure AD Connect
D. Azure Key Vault

SIEM & SOAR Solution: Microsoft Sentinel (formerly Azure Sentinel) is a scalable, cloud-native Security Information and Event Management (SIEM) and Security Orchestration, Automated Response (SOAR) system.

It provides native data connectors to ingest audit and sign-in logs from Microsoft Entra ID (Azure AD) at no ingestion cost for certain standard logs.

Sentinel employs machine learning and built-in analytics rules to automatically analyze incoming security events, correlate anomalies across disparate sources, detect active threats, and trigger automated incident playbooks.

Answer: A

Explanation:

Microsoft Azure Sentinel is a scalable, cloud-native, security information event management (SIEM) and

security orchestration automated response (SOAR) solution. Azure Sentinel delivers intelligent security analytics and threat intelligence across the enterprise, providing a single solution for alert detection, threat visibility, proactive hunting, and threat response.

Azure Sentinel comes with a number of connectors for Microsoft solutions, available out of the box and providing real-time integration, including Microsoft 365 Defender (formerly Microsoft Threat Protection) solutions, and Microsoft 365 sources, including Office 365, Azure AD, Microsoft Defender for Identity (formerly Azure ATP), and Microsoft Cloud App Security, and more.

Reference:

https://docs.microsoft.com/en-us/azure/sentinel/overview

Question: 262 CertyIQ

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your Azure environment contains multiple Azure virtual machines.
You need to ensure that a virtual machine named VM1 is accessible from the Internet over HTTP.
Solution: You modify an Azure firewall.
Does this meet the goal?

A. Yes
B. No

Azure Firewall Inbound Filtering & DNAT: Azure Firewall is a cloud-native, stateful network security service that provides Layer 3–7 traffic inspection.

To allow incoming internet traffic to reach a virtual machine behind Azure Firewall on port 80 (HTTP), you configure an Azure Firewall DNAT (Destination Network Address Translation) rule.

Answer: A

Explanation:

When configured, internet clients connect to the Azure Firewall's public IP address on port 80; the firewall translates the destination IP address to the private IP address of VM1 and applies network rules to allow the inbound traffic, thereby making VM1 accessible over HTTP.

Azure Firewall is a managed, cloud-based network security service that protects your Azure Virtual Network resources. It's a fully stateful firewall as a service with built-in high availability and unrestricted cloud scalability.

In this question, we need to add a rule to Azure Firewall to allow the connection to the virtual machine on port 80 (HTTP).

References:

https://docs.microsoft.com/en-us/azure/firewall/overview

Question: 263 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
Azure Germany can be used by legal residents of Germany only.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed`. If the statement is incorrect, select the answer choice that makes the statement correct.

A. no change is needed
B. only enterprises that are registered in Germany
C. only enterprises that purchase their azure licenses from a partner based in Germany
D. any user or enterprise that requires its data to reside in Germany

Answer: D

Explanation:
Azure Germany is available to eligible customers and partners globally who intend to do business in the EU/EFTA, including the United Kingdom.
Azure Germany offers a separate instance of Microsoft Azure services from within German datacenters. The datacenters are in two locations, Frankfurt/Main and
Magdeburg. This placement ensures that customer data remains in Germany and that the datacenters connect to each other through a private network. All customer data is exclusively stored in those datacenters. A designated German company--the German data trustee--controls access to customer data and the systems and infrastructure that hold customer data.

Reference:
https://docs.microsoft.com/en-us/azure/germany/germany-welcome?toc=%2fazure%2fgermany%2ftoc.json
https://docs.microsoft.com/en-us/azure/germany/germany-overview-data-trustee

Question: 264 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 1 (Yes): On-premises Active Directory Domain Services (AD DS) user identities and groups can be synchronized to Microsoft Entra ID (Azure AD) using Microsoft Entra Connect Sync or Microsoft Entra Cloud Sync, enabling a unified hybrid identity.

Statements	Yes	No
Identities stored in an on-premises Active Directory can be synchronized to Azure Active Directory (Azure AD).	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Statement 2 (Yes): Azure supports multiple identity origins to access Azure resources:

Answer: Native cloud identities created directly in Microsoft Entra ID.

Synchronized or federated accounts originating from on-premises Active Directory.

External federated identities originating from third-party cloud services via Entra External ID / B2B collaboration (e.g., Google accounts, federated SAML/OIDC identity providers).

Statement 3 (Yes): Azure incorporates built-in identity authentication via Microsoft Entra ID (OAuth 2.0 / OpenID Connect, MFA, Conditional Access) and built-in authorization via Azure Role-Based Access Control (Azure RBAC) to secure management plane and data plane access across all Azure resources

Answer Area

Statements	Yes	No
Identities stored in an on-premises Active Directory can be synchronized to Azure Active Directory (Azure AD).	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Explanation:
Box 1: Yes -
The tool you would use to sync the accounts is Azure AD Connect. The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD.

Box 2: Yes -
As described above, third-party cloud services and on-premises Active Directory can be used to access Azure resources. This is known as 'federation'.
Federation is a collection of domains that have established trust. The level of trust may vary, but typically includes authentication and almost always includes authorization. A typical federation might include a number of organizations that have established trust for shared access to a set of resources.

Box 3: Yes -
Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-whatis
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/whatis-fed https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-scenarios

Question: 265 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

. You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Azure Security Center

Answer:

Answer Area

. You can view your company's regulatory compliance report from

- Azure Advisor
- Azure Analysis Services
- Azure Monitor
- Azure Security Center

Explanation:
The advanced monitoring capabilities in Security Center lets you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

Reference:
https://docs.microsoft.com/en-us/azure/security-center/security-center-intro

Question: 266 CertyIQ

What should you use to evaluate whether your company's Azure environment meets regulatory requirements?

A. Azure Service Health
B. Azure Knowledge Center
C. Azure Security Center
D. Azure Advisor

Regulatory Compliance Dashboard: In Azure Security Center (now Microsoft Defender for Cloud), the Regulatory Compliance dashboard continuously evaluates cloud workloads against selected industry and government compliance standards (e.g., ISO 27001, SOC 2, PCI-DSS, HIPAA, NIST SP 800-53).

It assesses deployed resources against compliance controls using underlying Azure Policy definitions, highlights non-compliant assessments, provides remediation steps, and generates downloadable audit summary reports

Answer: C

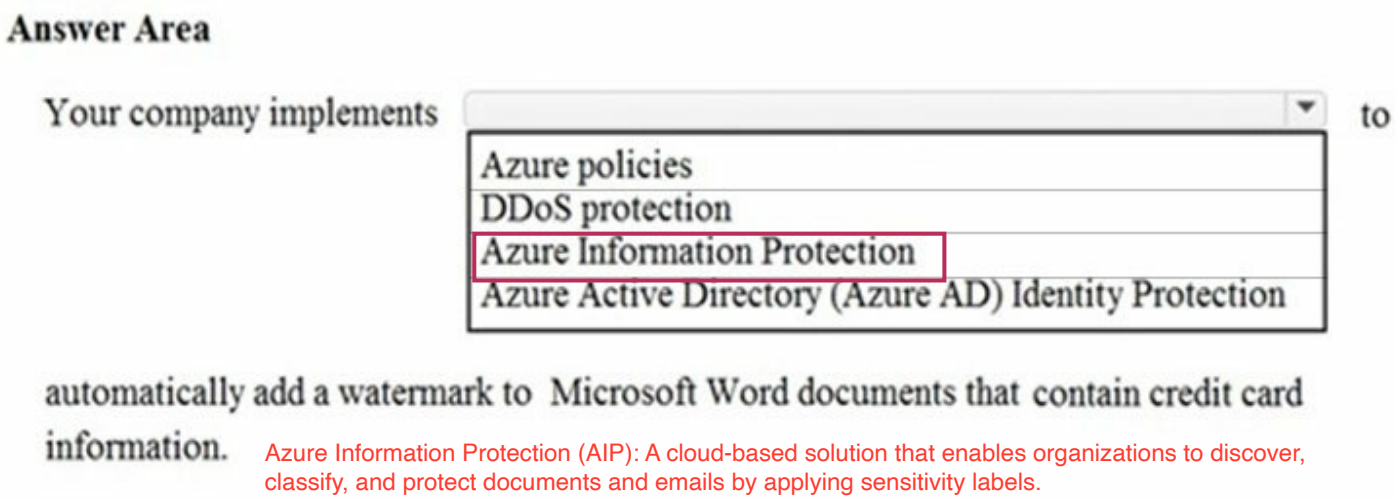

Explanation:
The advanced monitoring capabilities in Security Center lets you track and manage compliance and governance over time. The overall compliance provides you with a measure of how much your subscriptions are compliant with policies associated with your workload.

Reference:
https://docs.microsoft.com/en-us/azure/security-center/security-center-intro

Question: 267 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.

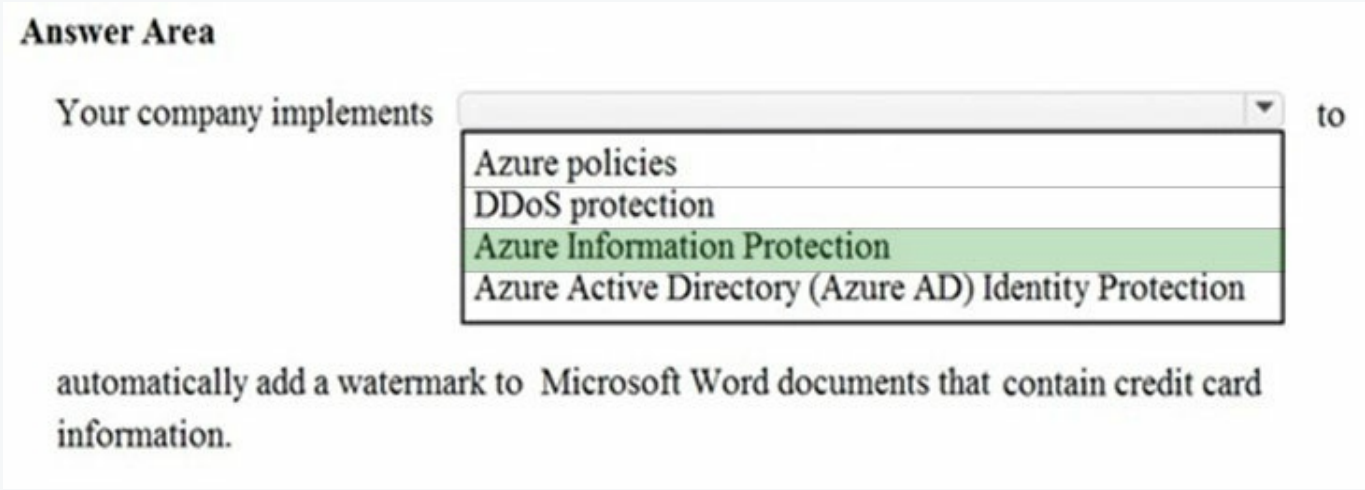

Hot Area:

Azure Information Protection (AIP): A cloud-based solution that enables organizations to discover, classify, and protect documents and emails by applying sensitivity labels.

AIP can inspect document content for sensitive information types (such as credit card numbers) and automatically apply protective actions, including headers, footers, encryption, and visual watermarks directly inside Microsoft Office applications (such as Microsoft Word).

Answer:

Explanation:

Azure Information Protection is used to automatically add a watermark to Microsoft Word documents that contain credit card information.

You use Azure Information Protection labels to apply classification to documents and emails. When you do this, the classification is identifiable regardless of where the data is stored or with whom it's shared. The labels can include visual markings such as a header, footer, or watermark.

Labels can be applied automatically by administrators who define rules and conditions, manually by users, or a combination where users are given recommendations. In this question, we would configure a label to be automatically applied to Microsoft Word documents that contain credit card information. The label would then add the watermark to the documents.

https://docs.microsoft.com/en-us/azure/information-protection/what-is-information-protection

https://docs.microsoft.com/en-us/azure/information-protection/infoprotect-quick-start-tutorial

Question: 268

CertyIQ

HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statement 1 (No): Microsoft Entra ID (Azure AD) is a multi-tenant, cloud-based identity and access management service provided as a fully managed platform (Identity as a Service - IDaaS). It does not rely on Windows Server Active Directory Domain Services (AD DS) architectures, Kerberos/NTLM domain structures, or physical/virtual domain controllers. Deploying domain controllers on Azure VMs is only necessary when hosting legacy on-premises AD DS workloads on IaaS.

Statements	Yes	No
Azure Active Directory (Azure AD) requires the implementation of domain controllers on Azure virtual machines.	○	○
Azure Active Directory (Azure AD) provides authentication services for resources hosted in Azure and Microsoft 365.	○	○
Each user account in Azure Active Directory (Azure AD) can be assigned only one license.	○	○

Statement 2 (Yes): Microsoft Entra ID serves as the centralized identity provider across the entire Microsoft Cloud ecosystem, delivering authentication, single sign-on (SSO), and conditional access for Azure subscription resources, Microsoft 365 workloads (Teams, Exchange Online, SharePoint), Dynamics 365, and third-party cloud apps

Statement 3 (No): A single user account can have multiple concurrent product and feature licenses assigned to it (e.g., a user can hold an M365 E5 license, a Microsoft Entra ID P2 license, a Power BI Pro license, and an Azure DevOps license simultaneously).

Answer:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) requires the implementation of domain controllers on Azure virtual machines.	○	●
Azure Active Directory (Azure AD) provides authentication services for resources hosted in Azure and Microsoft 365.	●	○
Each user account in Azure Active Directory (Azure AD) can be assigned only one license.	○	●

Explanation:

Box 1: No -
Azure Active Directory (Azure AD) is a cloud-based service. It does not require domain controllers on virtual machines.

Box 2: Yes -
Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources and Microsoft 365.

Box 3: No -
User accounts in Azure Active Directory can be assigned multiple licenses for different Azure or Microsoft 365 services.

Question: 269 CertyIQ

Which two types of customers are eligible to use Azure Government to develop a cloud solution? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. a Canadian government contractor
B. a European government contractor
C. a United States government entity
D. a United States government contractor
E. a European government entity

Answer: CD

Explanation:
Azure Government is a cloud environment specifically built to meet compliance and security requirements for US government. This mission-critical cloud delivers breakthrough innovation to U.S. government customers and their partners. Azure Government applies to government at any level " from state and local governments to federal agencies including Department of Defense agencies.
The key difference between Microsoft Azure and Microsoft Azure Government is that Azure Government is a sovereign cloud. It's a physically separated instance of Azure, dedicated to U.S. government workloads only. It's built exclusively for government agencies and their solution providers.

Reference:
https://docs.microsoft.com/en-us/learn/modules/intro-to-azure-government/2-what-is-azure-government

Question: 270 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.

Hot Area:

Answer Area

Statement 1 (No): Microsoft Entra MFA functions natively for pure cloud-only user identities created directly in the cloud directory. There is no prerequisite or dependency to synchronize on-premises Active Directory Domain Services (AD DS) accounts using Entra Connect to enable or enforce MFA.

When you synchronize on-premises Active Directory accounts to Microsoft Entra ID, you can fully protect them with Microsoft Entra Multifactor Authentication.

Once an on-premises account is synchronized using Microsoft Entra Connect (or Cloud Sync), an identity object represents that user in the cloud.

Statements	Yes	No
To implement an Azure Multi-Factor Authentication (MFA) solution, you must sync on-premises identities to the cloud.	○	○
Two valid methods for Azure Multi-Factor Authentication (MFA) are picture identification and a passport number.	○	○
Azure Multi-Factor Authentication (MFA) can be required for administrative and non-administrative user accounts.	○	○

Answer:

Statement 2 (No): Multi-factor authentication requires two or more distinct authentication categories: Something you know (password/PIN), Something you have (authenticator app, hardware FIDO2 key, SMS/phone, OATH token), and Something you are (biometrics like Windows Hello face or fingerprint). A picture ID and passport number are static, manually verified government credentials, not supported digital authentication factors in Azure MFA

Statement 3 (Yes): Conditional Access policies and Security Defaults can enforce MFA broadly across all users in the tenant, targeting administrative roles (such as Global Administrator, Privileged Role Administrator) as well as standard non-administrative end-user accounts

Answer Area

Statements	Yes	No
To implement an Azure Multi-Factor Authentication (MFA) solution, you must sync on-premises identities to the cloud.	○	○
Two valid methods for Azure Multi-Factor Authentication (MFA) are picture identification and a passport number.	○	○
Azure Multi-Factor Authentication (MFA) can be required for administrative and non-administrative user accounts.	○	○

Explanation:
Box 1: No -
It is not true that you must deploy a federation solution or sync on-premises identities to the cloud. You can have a cloud-only environment and use MFA.

Box 2: No -
Picture identification and passport numbers are not valid MFA authentication methods. Valid methods include: Password, Microsoft Authenticator App, SMS and
Voice call.
Box 3:
You can configure MFA to be required for administrator accounts only or you can configure MFA for any user account.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/authentication/howto-mfa-getstarted
https://docs.microsoft.com/en-us/azure/active-directory/authentication/concept-authentication-methods

Question: 271 CertyIQ

You need to ensure that when Azure Active Directory (Azure AD) users connect to Azure AD from the Internet by using an anonymous IP address, the users are prompted automatically to change their password.
Which Azure service should you use?

A. Azure AD Connect Health
B. Azure AD Privileged Identity Management
C. Azure Advanced Threat Protection (ATP)
D. Azure AD Identity Protection

Risk Detection & Automated Remediation: Microsoft Entra ID Protection continuously evaluates sign-in events and user behaviors using Microsoft's threat intelligence data.

Anonymous IP Address: Connecting via an anonymous IP address (such as Tor browser or anonymous VPNs) is categorized by Entra ID Protection as a real-time Sign-in Risk detection.

Automated Policy Enforcement: Organizations can configure risk policies (or Conditional Access policies integrated with risk signals) that automatically take action when a risk is detected. By enforcing a User Risk policy or requiring Self-Service Password Reset (SSPR) when risk is detected, the user is required to successfully authenticate with MFA and immediately change their password before accessing resources.

Answer: D

Explanation:
Azure AD Identity Protection includes two risk policies: sign-in risk policy and user risk policy. A sign-in risk represents the probability that a given authentication request isn't authorized by the identity owner.
There are several types of risk detection. One of them is Anonymous IP Address. This risk detection type indicates sign-ins from an anonymous IP address (for example, Tor browser or anonymous VPN). These IP addresses are typically used by actors who want to hide their login telemetry (IP address, location, device, etc.) for potentially malicious intent.
You can configure the sign-in risk policy to require that users change their password.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/howto-sign-in-risk-policy
https://docs.microsoft.com/en-us/azure/active-directory/identity-protection/concept-identity-protection-risks

Question: 272 CertyIQ

DRAG DROP -
Match the term to the correct definition.
Instructions: To answer, drag the appropriate term from the column on the left to its description on the right. Each term may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Answer Options	Answer Area	
Azure Government	ISO	An organization that defines international standards across all industries.
GDPR	NIST	An organization that defines standards used by the United States government.
ISO	GDPR	A European policy that regulates data privacy and data protection.
NIST	Azure Government	A dedicated public cloud for federal and state agencies in the United States.

Answer:

Answer Options	Answer Area	
Azure Government	ISO	An organization that defines international standards across all industries.
GDPR	NIST	An organization that defines standards used by the United States government.
ISO	GDPR	A European policy that regulates data privacy and data protection.
NIST	Azure Government	A dedicated public cloud for federal and state agencies in the United States.

Explanation:
Box 1: ISO -
ISO is the International Organization for Standardization. Companies can be certified to ISO standards, for example ISO 9001 or 27001 are commonly used in IT companies.

Box 2: NIST -
The National Institute of Standards and Technology (NIST) is a physical sciences laboratory, and a non-regulatory agency of the United States Department of
Commerce.

Box 3: GDPR -
GDPR is the General Data Protection Regulations. This standard was adopted across Europe in May 2018 and

replaces the now deprecated Data Protection
Directive.
The General Data Protection Regulation (EU) (GDPR) is a regulation in EU law on data protection and privacy in the European Union (EU) and the European
Economic Area (EEA). It also addresses the transfer of personal data outside the EU and EEA areas. The GDPR aims primarily to give control to individuals over their personal data and to simplify the regulatory environment for international business by unifying the regulation within the EU.

Box 4: Azure Government -
US government agencies or their partners interested in cloud services that meet government security and compliance requirements, can be confident that
Microsoft Azure Government provides world-class security, protection, and compliance services. Azure Government delivers a dedicated cloud enabling government agencies and their partners to transform mission-critical workloads to the cloud. Azure Government services handle data that is subject to certain government regulations and requirements, such as FedRAMP, NIST 800.171 (DIB), ITAR, IRS 1075, DoD L4, and CJIS. In order to provide you with the highest level of security and compliance, Azure Government uses physically isolated datacenters and networks (located in U.S. only).

Reference:
https://en.wikipedia.org/wiki/National_Institute_of_Standards_and_Technology
https://en.wikipedia.org/wiki/General_Data_Protection_Regulation https://docs.microsoft.com/en-us/azure/azure-government/documentation-government-welcome

Question: 273 CertyIQ

To what should an application connect to retrieve security tokens?

A. an Azure Storage account
B. Azure Active Directory (Azure AD)
C. a certificate store
D. an Azure key vault

Token Issuance via Identity Provider: In modern cloud authentication protocols (OAuth 2.0, OpenID Connect, and SAML 2.0), security tokens (JWT access tokens, ID tokens, and refresh tokens) are minted and cryptographically signed exclusively by an Identity Provider (IdP).

Microsoft Entra ID (Azure AD) acts as the centralized cloud identity provider. When an application or user needs to authenticate and gain authorization to access a protected API or resource (such as Microsoft Graph, Azure ARM endpoints, or custom web APIs), the application connects to the Microsoft Entra token endpoint (https://login.microsoftonline.com/{tenant-id}/oauth2/v2.0/token) to acquire a security token.

Answer: D

Explanation:

Azure key vault: While applications authenticate to Azure Key Vault to fetch stored static secrets (like API keys or connection strings), Key Vault requires a security token from Entra ID to authenticate the caller in the first place. Key Vault is a secret/key vault, not a token-issuing identity service.

Key Vault is designed to store configuration secrets for server apps.

Incorrect Answers:

A: An Azure Storage account is used to store data. It is not used to store secrets for applications.

B: Azure Active Directory (Azure AD) is a centralized identity provider in the cloud that authenticates users and provides access tokens to them. It is not used for applications.

Reference:

https://docs.microsoft.com/en-us/learn/modules/manage-secrets-with-azure-key-vault/2-what-is-key-vault
https://docs.microsoft.com/en-us/azure/key-vault/key-vault-overview

Question: 274 CertyIQ

Your network contains an Active Directory forest. The forest contains 5,000 user accounts.
Your company plans to migrate all network resources to Azure and to decommission the on-premises data center.
You need to recommend a solution to minimize the impact on users after the planned migration.
What should you recommend?

A. Implement Azure Multi-Factor Authentication (MFA)
B. Sync all the Active Directory user accounts to Azure Active Directory (Azure AD)
C. Instruct all users to change their password
D. Create a guest user account in Azure Active Directory (Azure AD) for each user

Answer: B

Explanation:
To migrate to Azure and decommission the on-premises data center, you would need to create the 5,000 user accounts in Azure Active Directory. The easy way to do this is to sync all the Active Directory user accounts to Azure Active Directory (Azure AD). You can even sync their passwords to further minimize the impact on users. The tool you would use to sync the accounts is Azure AD Connect. The Azure Active Directory Connect synchronization services (Azure AD Connect sync) is a main component of Azure AD Connect. It takes care of all the operations that are related to synchronize identity data between your on-premises environment and Azure AD.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/how-to-connect-sync-whatis

Question: 275 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can configure the Azure Active Directory (Azure AD) activity logs to appear in Azure Monitor.	○	○
From Azure Monitor, you can monitor resources across multiple Azure subscriptions.	○	○
From Azure Monitor, you can create alerts.	○	○

Statement 1 (Yes):

Answer: Diagnostic settings in Microsoft Entra ID (formerly Azure Active Directory) allow routing of audit logs and sign-in activity logs directly to an Azure Monitor Log Analytics workspace, an Azure storage account, or Azure Event Hubs for long-term retention and centralized query analysis with KQL.

Statement 3 (Yes):

Alerting is a foundational feature of Azure Monitor. You can configure Metric Alerts, Log Search Alerts, and Activity Log Alerts to proactively trigger action groups (emails, SMS, push notifications, webhooks, Azure Functions, or Logic Apps) when specific thresholds or operational events are detected.

Statement 2 (Yes):

Azure Monitor operates as a tenant-level and cross-subscription observability platform. Within Azure Monitor, you can aggregate, query, and visualize metrics, activity logs, and log analytics workspaces spanning multiple Azure subscriptions within the same Microsoft Entra tenant (or across tenants using Azure Lighthouse).

Answer Area

Statements	Yes	No
You can configure the Azure Active Directory (Azure AD) activity logs to appear in Azure Monitor.	○	○
From Azure Monitor, you can monitor resources across multiple Azure subscriptions.	○	○
From Azure Monitor, you can create alerts.	○	○

Explanation:
Box 1: Yes -
You can send Azure AD activity logs to Azure Monitor logs to enable rich visualizations, monitoring and alerting on the connected data.
All data collected by Azure Monitor fits into one of two fundamental types, metrics and logs (including Azure AD activity logs). Activity logs record when resources are created or modified. Metrics tell you how the resource is performing and the resources that it's consuming.

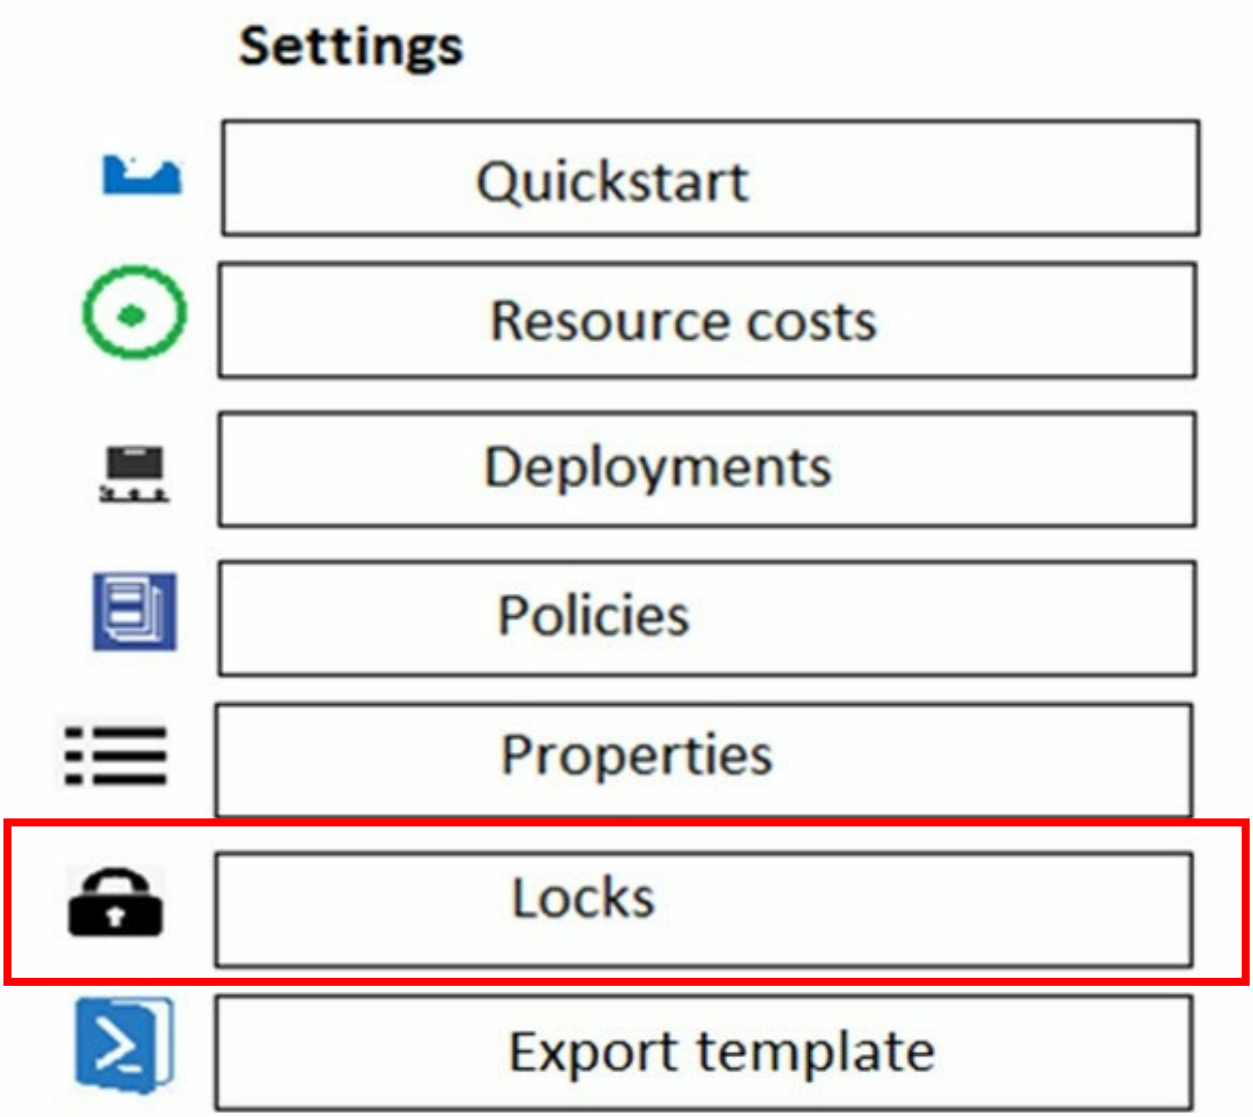

Box 2: Yes -
Azure Monitor can consolidate log entries from multiple Azure resources, subscriptions, and tenants into one location for analysis together.

Box 3: Yes -
You can create alerts in Azure Monitor.
Alerts in Azure Monitor proactively notify you of critical conditions and potentially attempt to take corrective action. Alert rules based on metrics provide near real time alerting based on numeric values, while rules based on logs allow for complex logic across data from multiple sources.

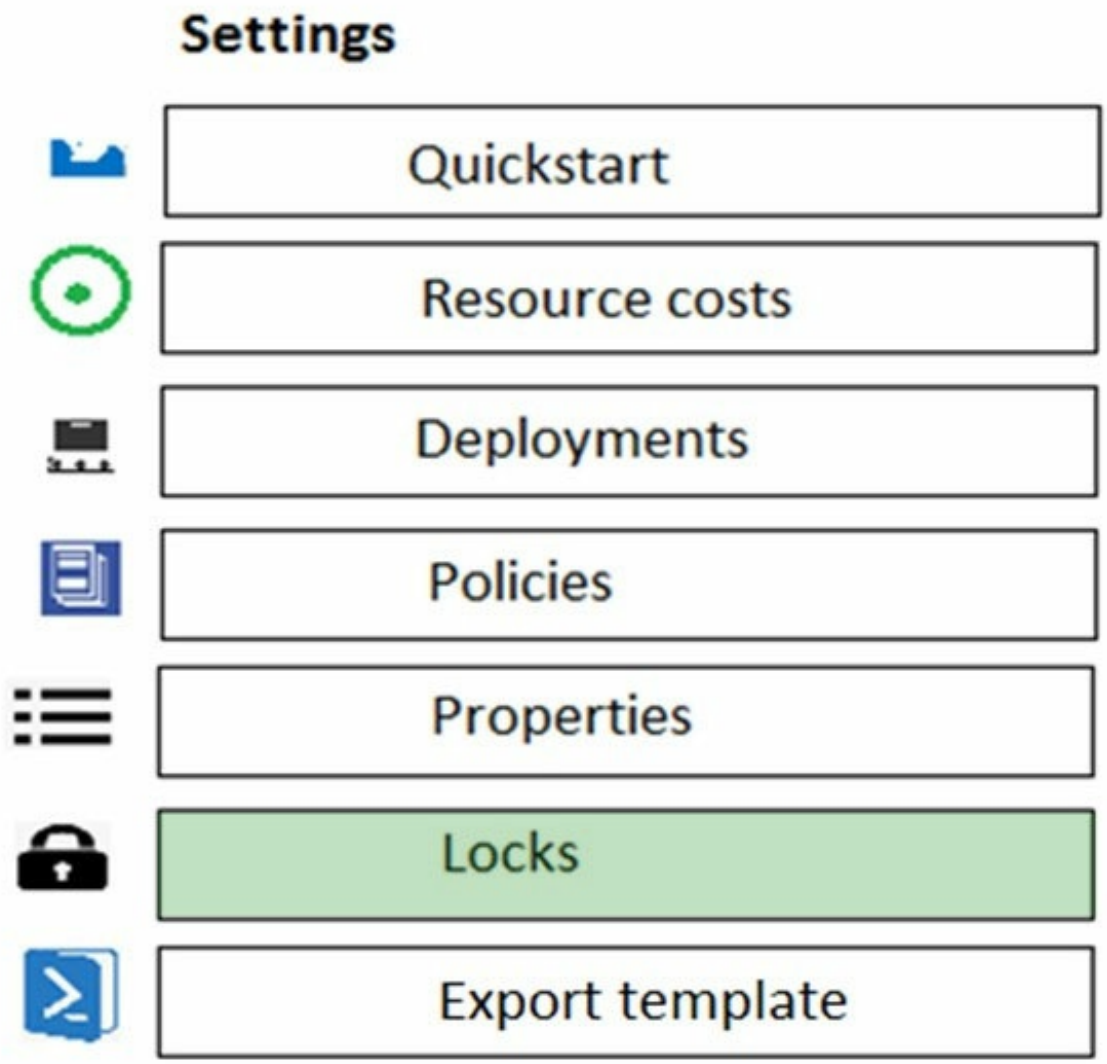

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/reports-monitoring/concept-activity-logs-azure-monitor https://docs.microsoft.com/en-us/azure/azure-monitor/overview

Question: 276 CertyIQ

HOTSPOT -
You create a resource group named RG1 in Azure Resource Manager.
You need to prevent the accidental deletion of the resources in RG1.
Which setting should you use? To answer, select the appropriate setting in the answer area.
Hot Area:

Settings
Quickstart
Resource costs
Deployments
Policies
Properties
Locks
Export template

Answer:

Explanation:
You can configure a lock on a resource group to prevent the accidental deletion.
As an administrator, you may need to lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources. You can set the lock level to CanNotDelete or ReadOnly. In the portal, the locks are called Delete and Read-only respectively.
➪ CanNotDelete means authorized users can still read and modify a resource, but they can't delete the resource.
➪ ReadOnly means authorized users can read a resource, but they can't delete or update the resource.
Applying this lock is similar to restricting all authorized users to the permissions granted by the Reader role.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-lock-resources

Question: 277 CertyIQ

You have a resource group named RG1.
You need to prevent the creation of virtual machines in RG1. The solution must ensure that other objects can be created in RG1.
What should you use?

A. a lock
B. an Azure role
C. a tag
D. an Azure policy

Azure Policy enables governance by defining rules and effects for resource configurations across scopes (management groups, subscriptions, or resource groups).

Specifically, a built-in policy definition such as "Not allowed resource types" can be assigned directly to RG1 to prevent deployments of virtual machines while leaving the creation of all other allowed Azure resource types unimpeded.

In the Microsoft Learn framework, Azure Policy focuses on resource properties and compliance (what can or cannot be deployed), whereas Azure Role-Based Access Control (Azure RBAC) focuses on user actions (who can perform actions).

Answer: D

Explanation:
Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.
Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements.
In this question, we would create an Azure policy assigned to the resource group that denies the creation of virtual machines in the resource group.
You could place a read-only lock on the resource group. However, that would prevent the creation of any resources in the resource group, not virtual machines only. Therefore, an Azure Policy is a better solution.

Reference:
https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 278 CertyIQ

You have an Azure subscription and 100 Windows 10 devices.
You need to ensure that only users whose devices have the latest security patches installed can access Azure Active Directory (Azure AD)-integrated applications.
What should you implement?

A. a conditional access policy
B. Azure Bastion
C. Azure Firewall
D. Azure Policy

Microsoft Entra Conditional Access (formerly Azure AD Conditional Access) functions as the identity-driven control plane under the Zero Trust security architecture ("verify explicitly").

It evaluates contextual signals—such as user identity, physical/IP location, real-time risk, and device compliance status (evaluated in conjunction with Mobile Device Management solutions like Microsoft Intune)—to enforce controls such as granting access, requiring MFA, or blocking access to cloud applications.

Answer: A

Explanation:

By requiring a device to be marked as compliant before accessing Azure AD-integrated applications, organizations ensure endpoint requirements (such as minimum OS patch levels, BitLocker encryption, and active antivirus) are satisfied.

A conditional access policy is a feature of Azure Active Directory (Azure AD) that enables you to control access to cloud applications based on a set of conditions. You can use a conditional access policy to restrict access to Azure AD-integrated applications to only those devices that meet certain security requirements, such as having the latest security patches installed.

By implementing a conditional access policy, you can ensure that only users whose devices have the latest security patches can access Azure AD-integrated applications, while blocking access for users with devices that do not meet the security requirements.

Reference:

https://docs.microsoft.com/en-us/azure/active-directory/conditional-access/concept-conditional-access-policies

Question: 279 CertyIQ

What can Azure Information Protection encrypt?

A. network traffic

B. documents and email messages

C. an Azure Storage account

D. an Azure SQL database

Azure Information Protection (AIP)—now deeply integrated into Microsoft Purview Information Protection—is a cloud-based solution that helps discover, classify, and protect unstructured data items (specifically documents and email messages).

It leverages Azure Rights Management (Azure RMS) encryption to embed persistent protection directly into file metadata and email headers, ensuring only authorized identities can decrypt, view, edit, or forward the content, even when files leave the corporate network or boundary.

Answer: B

Explanation:

Azure Information Protection can encrypt documents and emails.

Azure Information Protection is a cloud-based solution that helps an organization to classify and optionally, protect its documents and emails by applying labels.

Labels can be applied automatically by administrators who define rules and conditions, manually by users, or a combination where users are given recommendations.

The protection technology uses Azure Rights Management (often abbreviated to Azure RMS). This technology is integrated with other Microsoft cloud services and applications, such as Office 365 and Azure Active Directory.

This protection technology uses encryption, identity, and authorization policies. Similarly to the labels that are applied, protection that is applied by using Rights

Management stays with the documents and emails, independently of the location " inside or outside your organization, networks, file servers, and applications.

https://docs.microsoft.com/en-us/azure/information-protection/what-is-information-protection

https://docs.microsoft.com/en-us/azure/information-protection/quickstart-label-dnf-protectedemail

Question: 280 CertyIQ

What should you use to evaluate whether your company's Azure environment meets regulatory requirements?

A. the Knowledge Center website

B. the Advisor blade from the Azure portal

C. Compliance Manager from the Service Trust Portal

D. the Solutions blade from the Azure portal

Compliance Manager (historically accessible via the Microsoft Service Trust Portal and now integrated into the Microsoft Purview compliance portal) is an end-to-end management tool designed to track, assign, and verify compliance activities against international and regional standards/regulations (such as ISO 27001, GDPR, NIST, and HIPAA).

Answer: C

Explanation:

It provides a risk-based Compliance Score to measure progress in completing recommended improvement actions that help satisfy regulatory frameworks across Microsoft cloud environments.

Compliance Manager in the Service Trust Portal is a workflow-based risk assessment tool that helps you track, assign, and verify your organization's regulatory compliance activities related to Microsoft Cloud services, such as Microsoft 365, Dynamics 365, and Azure.

Compliance Manager has moved from the Service Trust Portal to its new location in the Microsoft 365 compliance center

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

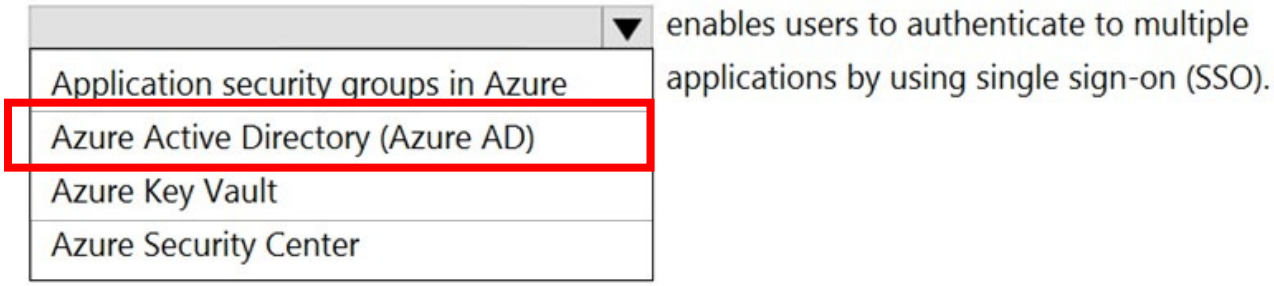

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

Question: 281 CertyIQ

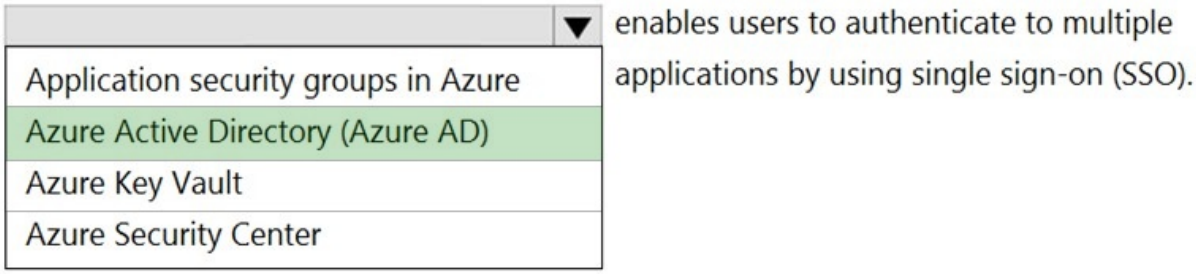

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:

Azure AD provides services such as:

- Single sign-on: Single sign-on (SSO) enables you to remember only one username and one password to access multiple applications. A single identity is tied to a user, which simplifies the security model. As users change roles or leave an organization, access modifications are tied to that identity, which greatly reduces the effort needed to change or disable accounts.

https://learn.microsoft.com/en-us/training/modules/describe-azure-identity-access-security/3-authentication-methods

Question: 282 CertyIQ

You have an Azure subscription.
Where will you find details on the personal data collected by Microsoft, how Microsoft uses the data, and what the data is used for?

A. the Data Protection Addendum
B. the Microsoft Online Services Terms
C. the Microsoft Privacy Statement
D. Azure Security Center

Under Microsoft's Trust, Privacy, and Compliance framework, the Microsoft Privacy Statement explains the personal data Microsoft processes, how Microsoft processes it, and for what purposes (spanning Microsoft products, services, websites, apps, software, servers, and devices). It covers specific categories including customer data collection mechanisms, cookies, account controls, data retention timelines, and global transfer mechanisms.

the Data Protection Addendum (DPA): A contractual agreement between enterprise customers and Microsoft that defines data processing terms, security measures, and regulatory obligations (such as GDPR) for customer data stored and processed in online services, rather than Microsoft's broad public statement on personal data handling.

Azure Security Center (now Microsoft Defender for Cloud): A cloud security posture management (CSPM) and cloud workload protection platform (CWPP) used to monitor and secure resources inside your Azure subscription. It does not contain documentation regarding Microsoft's global corporate privacy practices.

Answer: C

Explanation:

The Microsoft Privacy Statement explains the personal data Microsoft processes, how Microsoft processes it, and for what purposes. Your applicable Services
Agreement or the Preview Supplemental Terms may specify lesser or different privacy measures for some Preview services.

Reference:
https://azure.microsoft.com/en-us/support/legal/

Question: 283

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) can be used to manage access to on-premises applications.	○	○
Azure Active Directory (Azure AD) provides single sign-on (SSO).	○	○
iOS devices can be registered in Azure Active Directory (Azure AD).	○	○

Answer:

Answer Area

Statements	Yes	No
Azure Active Directory (Azure AD) can be used to manage access to on-premises applications.	○	○
Azure Active Directory (Azure AD) provides single sign-on (SSO).	○	○
iOS devices can be registered in Azure Active Directory (Azure AD).	○	○

https://docs.microsoft.com/en-us/azure/active-directory/devices/concept-azure-ad-register

Question: 284

CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Azure Policy Enforcement Scope: Azure Policy evaluates resource compliance during deployment and update events via Azure Resource Manager (ARM), as well as on recurring evaluation scans.

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Non-Destructive Compliance Evaluation: Assigning a policy (even with a Deny effect or assigning "Not Allowed Resource Types") to a scope containing pre-existing resources does not automatically delete, move, reconfigure, or restrict the operational state of existing resources.

Answer:

Instead, VNET1 is simply marked as Non-compliant in Azure Policy reporting and dashboards. The resource remains operational and continues to function normally.

Answer Area

You have an Azure virtual network named VNET1 in a resource group named RG1.

You assign the Azure Policy definition of Not Allowed Resource Type and specify that virtual networks are not an allowed resource type in RG1. VNET1

- is deleted automatically.
- is moved automatically to another resource group.
- continues to function normally.
- is now a read-only object.

Explanation:

The VNet will be marked as 'Non-compliant' when the policy is assigned. However, it will not be deleted and will continue to function normally.

Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements.

If there are any existing resources that aren't compliant with a new policy assignment, they appear under Non-compliant resources.

Question: 286

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area: Statement 1 (Yes): Azure Policy supports built-in policy definitions (such as "Add a tag to resources" or "Require a tag and its value on resources") utilizing effects like modify or append to automatically enforce or add tags to newly created or updated resources.

Statement 2 (Yes): An individual Azure resource can hold up to 50 tag key-value pairs (or up to 15 for classic deployments/specific storage sub-resources), allowing multiple distinct tags (e.g., Environment: Production, CostCenter: 1042, Owner: Finance) on the exact same resource.

Statement 3 (No): In Azure Resource Manager (ARM), tags are not inherited. Applying a tag to a subscription or a resource group does not automatically cascade or replicate that tag down to the resources deployed inside it. (Automating this behavior requires explicitly configuring an Azure Policy with a modify effect to inherit/copy tags from the parent resource group).

Answer Area

Statements	Yes	No
You can use Azure Policy to apply tags to resources	○	○
You can add multiple tags to the same Azure resource	○	○
An Azure resource inherits tags from the resource group to which the resource is deployed	○	○

Answer:

Answer Area

Statements	Yes	No
You can use Azure Policy to apply tags to resources	○	○
You can add multiple tags to the same Azure resource	○	○
An Azure resource inherits tags from the resource group to which the resource is deployed	○	○

Explanation:

Box 1: Yes -
You use Azure Policy to enforce tagging rules and conventions.

Box 2: Yes -
Each resource or resource group can have a maximum of 50 tags.

Box 3: No -
Tags applied to the resource group or subscription aren't inherited by the resources.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-policies
https://docs.microsoft.com/en-us/azure/governance/policy/tutorials/govern-tags
https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/tag-resources

Question: 287

CertyIQ

DRAG DROP -
Match the resources to the appropriate descriptions.
To answer, drag the appropriate resource from the column on the left to its description on the right. Each resource may be used once, more than once, or not at all.
NOTE: Each correct match is worth one point.
Select and Place:

Microsoft Privacy Statement: Explains what personal data Microsoft collects across its products and services, how Microsoft uses that information, and the purposes behind processing personal telemetry and account data.

Online Services Terms (OST / Product Terms): Represents the primary legal agreement between Microsoft and enterprise customers that establishes licensing terms, usage rights, and high-level mutual obligations regarding customer and personal data handling.

Resources	Answer Area	
Data Protection Addendum	Resource	Describes which personal data is collected, how the data is used, and what the data is used for.
Microsoft Privacy Statement	Resource	A legal agreement that details the obligations between Microsoft and a customer regarding the processing and security of customer data and personal data.
Online Services Terms	Resource	Defines the data processing and security terms for online services, including the disclosure of processed data and the transfer, retention, and deletion of data.

Microsoft Privacy Statement

Online Services Terms

Data Protection Adendum

Data Protection Addendum (DPA): Serves as an addendum to the OST that further defines detailed operational and technical terms for data processing and security, specifically addressing regulatory compliance, third-party disclosure, encryption, customer auditing

Answer:

Resources	Answer Area	
Data Protection Addendum	Microsoft Privacy Statement	Describes which personal data is collected, how the data is used, and what the data is used for.
Microsoft Privacy Statement	Online Services Terms	A legal agreement that details the obligations between Microsoft and a customer regarding the processing and security of customer data and personal data.
Online Services Terms	Data Protection Addendum	Defines the data processing and security terms for online services, including the disclosure of processed data and the transfer, retention, and deletion of data.

Explanation:

1. Microsoft Privacy Statement.

2. Online Services Terms: The Online Services Terms (OST) is a legal agreement between Microsoft and the customer. The OST details the obligations by both parties with respect to the processing and security of customer data and personal data. The OST applies specifically to Microsoft's online services that you license through a subscription, including Azure, Dynamics 365, Office 365, and Bing Maps.

3. Data Protection Addendum: The Data Protection Addendum (DPA) further defines the data processing and security terms for online services. These terms include, Disclosure of processed data, Data transfer, retention, and deletion, etc..

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

Azure China (operated by 21Vianet) is an independent, sovereign instance physically separated from Azure global cloud networks and commercial data centers. It possesses its own isolated identity infrastructure (separate Microsoft Entra ID tenant namespace), independent management endpoints, and dedicated billing mechanisms.

Azure China

is operated by Microsoft.
has feature parity with Azure global.
services can be accessed from China only.
is a distinct separate instance of Microsoft Azure.

Microsoft Azure operates specialized sovereign cloud instances to comply with strict regulatory, data residency, and legal sovereignty mandates.

Answer:

Due to Chinese regulatory and telecommunications licensing laws, Azure services within mainland China are operated, managed, and sold exclusively by a local Chinese partner, Shanghai Blue Cloud Technology Co., Ltd. (21Vianet), not Microsoft directly.

Answer Area

Azure China

is operated by Microsoft.
has feature parity with Azure global.
services can be accessed from China only.
is a distinct separate instance of Microsoft Azure.

Explanation:

"is a distinct separate instance of Microsoft Azure"

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China.

Question: 290 CertyIQ

What should you use to evaluate whether your company's Azure environment meets regulatory requirements?

A. Azure Service Health
B. Azure Knowledge Center
C. Microsoft Defender for Cloud
D. Azure Advisor

Microsoft Defender for Cloud (formerly Azure Security Center) includes a dedicated Regulatory Compliance dashboard as part of its Cloud Security Posture Management (CSPM) features.

It leverages Azure Policy initiatives under the hood to continuously assess workloads, identify gaps against selected compliance frameworks (such as NIST SP 800-53, CIS Microsoft Azure Foundations Benchmark, PCI-DSS, and ISO 27001), and provide prioritized remediation recommendations to satisfy those regulatory requirements.

Answer: C

Explanation:

Microsoft Defender for Cloud helps streamline the process for meeting regulatory compliance requirements, using the regulatory compliance dashboard.

Reference:

https://docs.microsoft.com/en-us/azure/defender-for-cloud/regulatory-compliance-dashboard

Question: 291 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

Answer Area

You can review audit reports and compliance-related information for Azure services from

- Microsoft Defender for Cloud.
- the Microsoft Defender for Identity admin center.
- the Microsoft 365 Compliance center.
- the Microsoft Service Trust Portal.

Under Microsoft's Trust, Privacy, and Compliance architecture, the Microsoft Service Trust Portal (STP) is the designated public/customer-facing repository for publishing independent, third-party audit reports (such as SOC 1/2/3, ISO/IEC 27001, FedRAMP, and PCI DSS reports) and regulatory compliance documentation demonstrating how Microsoft cloud services comply with global security standards.

Answer:

Answer Area

You can review audit reports and compliance-related information for Azure services from

- Microsoft Defender for Cloud.
- the Microsoft Defender for Identity admin center.
- the Microsoft 365 Compliance center.
- the Microsoft Service Trust Portal.

Explanation:

Microsoft Service Trust Portal.

The Microsoft Service Trust Portal provides a variety of content, tools, and other resources about Microsoft security, privacy, and compliance practices.

Trust Documents -

Provides a wealth of security implementation and design information with the goal of making it easier for you to meet regulatory compliance objectives by understanding how Microsoft Cloud services keep your data secure. To review content, select one of the following options on the Trust Documents pull-down menu.

* Audit Reports: A list of independent audit and assessment reports on Microsoft's Cloud services is displayed. These reports provide information about Microsoft

Cloud services compliance with data protection standards and regulatory requirements.

* Data Protection: Contains a wealth of resources such as audited controls, white papers, FAQs, penetration tests, risk assessment tools, and compliance guides.

* Azure Security and Compliance Blueprints: Resources that help you build secure and compliant cloud-based applications. This area contains blueprint-guidance for government, finance, healthcare, and retail verticals.

Incorrect:

Not: Microsoft Defender for Cloud.

Defender for Cloud is a tool for security posture management and threat protection. It strengthens the security posture of your cloud resources, and with its integrated Microsoft Defender plans, Defender for Cloud protects workloads running in Azure, hybrid, and other cloud platforms.

Defender for Cloud provides the tools needed to harden your resources, track your security posture, protect against cyber attacks, and streamline security management.

Not: the Microsoft 365 Compliance center

The Security & Compliance Center lets you grant permissions to people who perform compliance tasks like device management, data loss prevention, eDiscovery, retention, and so on. These people can perform only the tasks that you explicitly grant them access to.

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal

Question: 292

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Statement 1 (Yes): While the public areas of the Service Trust Portal (STP) are openly viewable, authenticated access using an organizational Microsoft cloud services account (such as a Microsoft Entra ID / Microsoft 365 / Azure work or school account) is supported and required to download protected SOC/ISO audit reports, view non-disclosure documents, or access tenant-specific features.

Statement 2 (Yes): Compliance Manager provides an end-to-end management dashboard to track, assign, and verify an organization's regulatory compliance activities, translating complex legal/regulatory standards (ISO 27001, HIPAA, GDPR, NIST) into actionable customer-managed control steps across Microsoft cloud services.

Statement 3 (Yes): Within the Service Trust Portal, the My Library feature allows authenticated users to pin, save, and bookmark compliance documents, audit reports, and white papers to a personal collection for centralized access and notification updates when documents are revised.

Answer Area

Statements	Yes	No
The Microsoft Service Trust Portal can be accessed by using a Microsoft cloud services account.	○	○
Compliance Manager can be used to track your company's regulatory compliance activities related to Microsoft cloud services.	○	○
The My Library feature can be used to save Microsoft Service Trust Portal documents and resources in a single location.	○	○

Answer:

Answer Area

Statements	Yes	No
The Microsoft Service Trust Portal can be accessed by using a Microsoft cloud services account.	○	○
Compliance Manager can be used to track your company's regulatory compliance activities related to Microsoft cloud services.	○	○
The My Library feature can be used to save Microsoft Service Trust Portal documents and resources in a single location.	○	○

Explanation:

https://learn.microsoft.com/en-us/microsoft-365/compliance/compliance-manager

Microsoft Purview Compliance Manager is a feature in the Microsoft Purview compliance portal that helps you manage your organization's multicloud compliance requirements with greater ease and convenience. Compliance Manager can help you throughout your compliance journey, from taking inventory of your data protection risks to managing the complexities of implementing controls, staying current with regulations and certifications, and reporting to auditors.

https://learn.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide#all-documents

This section displays all available documents. Select the documents to save into your My Library section. Documents are sorted under the same categories shown under Certifications, Standards, Regulations, and Industry Resources. To view all resources for a particular cloud service use the Cloud Service filter.

Reference:

https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal?view=o365-worldwide

Question: 293 CertyIQ

Your company has an Azure subscription that contains resources in several regions.
You need to create the Azure resource that must be used to meet the policy requirement.
What should you create?

A. a read-only lock
B. an Azure policy
C. a management group
D. a reservation

Azure Policy is the primary Azure governance service used to enforce organizational standards and evaluate compliance across subscriptions and resource groups. To enforce geographic or regional restrictions on resource creation, Microsoft provides the built-in policy definition "Allowed locations".When assigned at the subscription or resource group scope, this policy denies ARM deployment requests attempting to provision resources in any Azure region outside the approved list.

Answer: B

Explanation:
Azure policies can be used to define requirements for resource properties during deployment and for already existing resources. Azure Policy controls properties such as the types or locations of resources.
Azure Policy is a service in Azure that you use to create, assign, and manage policies. These policies enforce different rules and effects over your resources, so those resources stay compliant with your corporate standards and service level agreements. Azure Policy meets this need by evaluating your resources for non-compliance with assigned policies. All data stored by Azure Policy is encrypted at rest.
Azure Policy offers several built-in policies that are available by default. In this question, we would use the 'Allowed Locations' policy to define the locations where resources can be deployed.

Reference:
https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 294 CertyIQ

This question requires that you evaluate the underlined text to determine if it is correct.
From Azure Cloud Shell, you can track your company's regulatory standards and regulations, such as ISO 27001.
Instructions: Review the underlined text. If it makes the statement correct, select `No change is needed.` If the statement is incorrect, select the answer choice that makes the statement correct.

A. No change is needed.
B. the Microsoft Cloud Partner Portal
C. Compliance Manager
D. the Trust Center

Compliance Manager (available within Microsoft Purview and formerly integrated into the Service Trust Portal) is an end-to-end compliance management tool. It helps organizations track and assess risks against regulatory standards and industry regulations (such as ISO 27001, NIST, HIPAA, and GDPR) across Microsoft cloud services, translating compliance requirements into specific technical and non-technical customer improvement actions.

Azure Cloud Shell is an interactive, browser-accessible command-line shell (Bash or PowerShell) for provisioning and managing Azure resources; it does not track or evaluate regulatory standards.

Answer: C

Explanation:

It used to be "Trust Center", but now it is called Microsoft Purview Compliance Manager.

https://docs.microsoft.com/en-us/microsoft-365/compliance/compliance-manager?view=o365-worldwide

Microsoft Compliance Manager (Preview) is a free workflow-based risk assessment tool that lets you track, assign, and verify regulatory compliance activities related to Microsoft cloud services. Azure Cloud Shell, on the other hand, is an interactive, authenticated, browser-accessible shell for managing Azure resources.

References:

https://docs.microsoft.com/en-us/microsoft-365/compliance/compliance-manager-overview
https://docs.microsoft.com/en-us/azure/cloud-shell/overview

Statement 1 (No): Group Policy Objects (GPOs) are a feature of traditional, on-premises Active Directory Domain Services (AD DS) and Microsoft Entra Domain Services (formerly Azure AD DS). Native Microsoft Entra ID (formerly Azure Active Directory) does not support Group Policy; endpoint device policies in a cloud-first architecture are managed via Mobile Device Management (MDM) solutions like Microsoft Intune.

Question: 295 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
You can create Group Polices in Azure Active Directory (Azure AD).	○	○
You can join Windows 10 devices to Azure Active Directory (Azure AD).	○	○
You can join Android devices to Azure Active Directory (Azure AD).	○	○

Statement 3 (No): Non-Windows mobile operating systems like Android and iOS cannot be "joined" to Microsoft Entra ID. Instead, they can only be Registered (Microsoft Entra registered / Azure AD registered / Workplace Join) to provide Single Sign-On (SSO) and facilitate device management via Intune.

Answer:

Answer Area

Statements	Yes	No
You can create Group Polices in Azure Active Directory (Azure AD).	○	○
You can join Windows 10 devices to Azure Active Directory (Azure AD).	○	○
You can join Android devices to Azure Active Directory (Azure AD).	○	○

Explanation:

Azure AD join only applies to Windows 10 devices.

Reference:

https://docs.microsoft.com/en-us/azure/active-directory-domain-services/manage-group-policy
https://docs.microsoft.com/en-us/azure/active-directory/devices/azureadjoin-plan

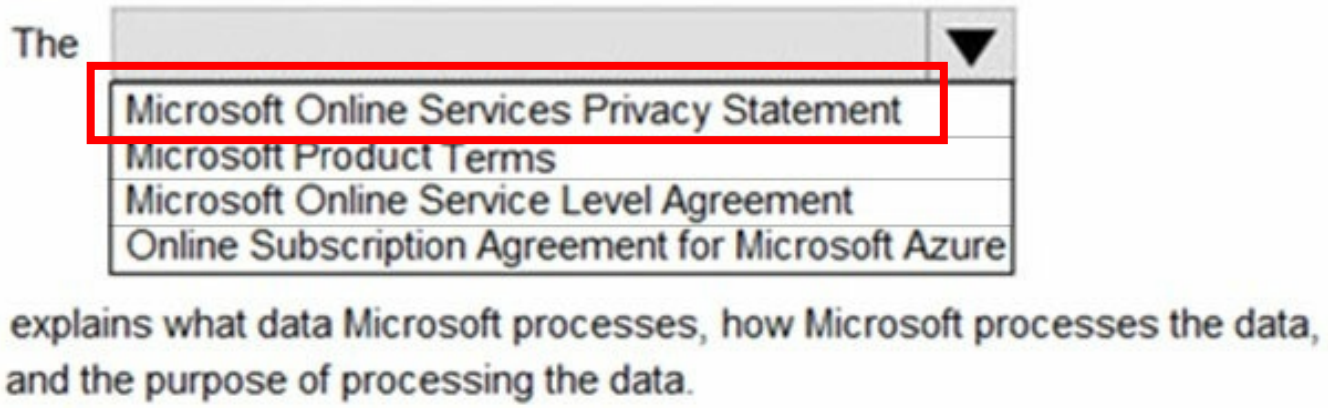

Question: 296 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

The Microsoft Privacy Statement (referenced here in the cloud enterprise context as the Microsoft Online Services Privacy Statement) explains what personal and organizational data Microsoft collects, how that data is processed, and the precise purposes behind processing it across all Microsoft products and services.

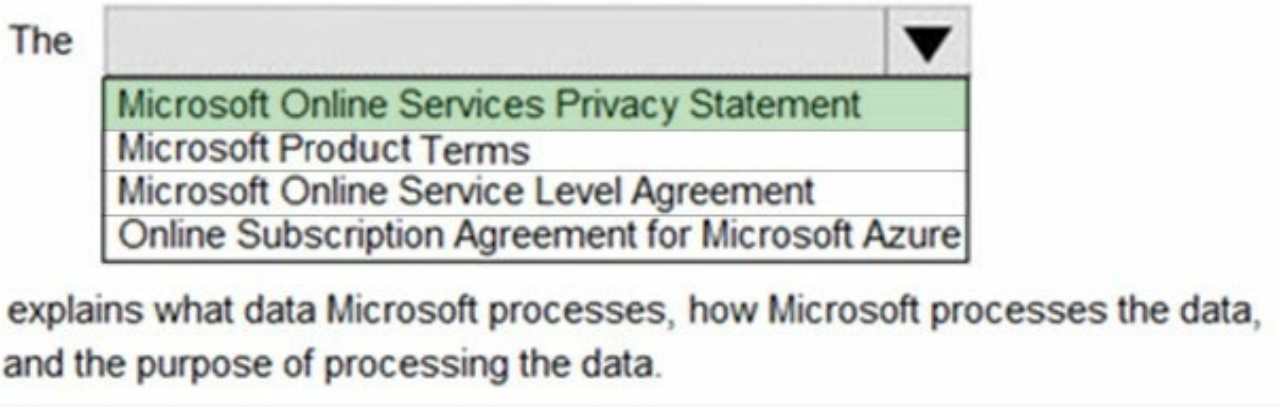

Microsoft Product Terms: The legal repository replacing the legacy Online Services Terms (OST) and Service Level Agreements in licensing contexts; it specifies licensing availability, product use rights, and acquisition terms, not privacy disclosures.

Answer Area

Answer:

Answer Area

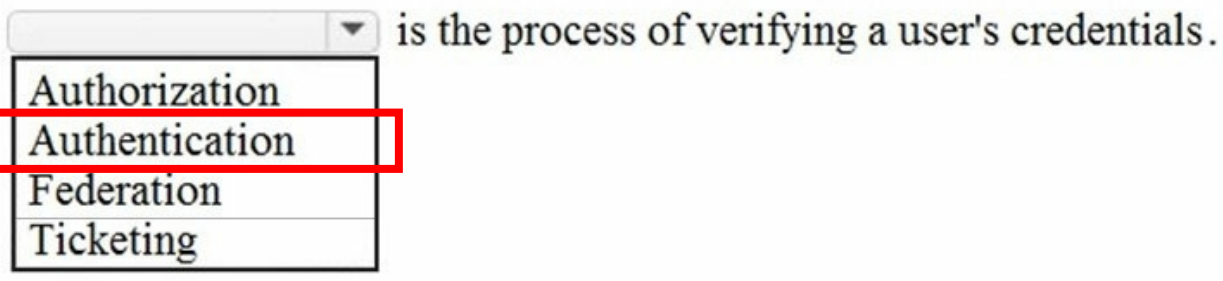

Explanation:
The Microsoft Privacy Statement explains what personal data Microsoft processes, how Microsoft processes the data, and the purpose of processing the data

Reference:
https://privacy.microsoft.com/en-us/privacystatement

Question: 297 CertyIQ

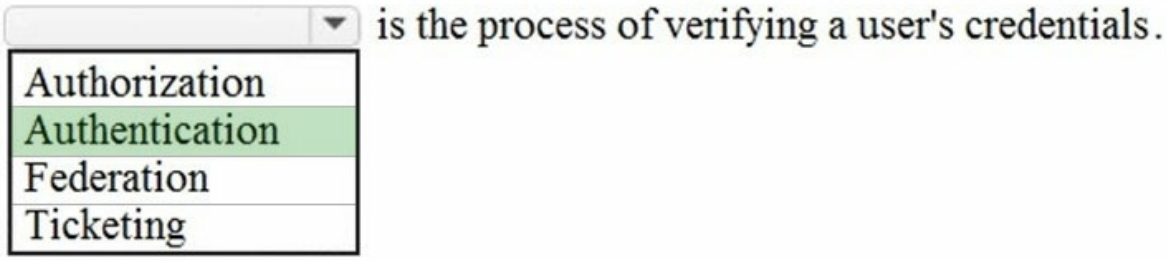

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

Answer:

Answer Area

Explanation:

Authentication, not authorization is the process of verifying a user's credentials.

The difference between authentication and authorization is:

✑ Authentication is proving your identity, proving that you are who you say you are. The most common example of this is logging in to a system by providing credentials such as a username and password.

✑ Authorization is what you're allowed to do once you've been authenticated. For example, what resources you're allowed to access and what you can do with those resources.

Question: 298

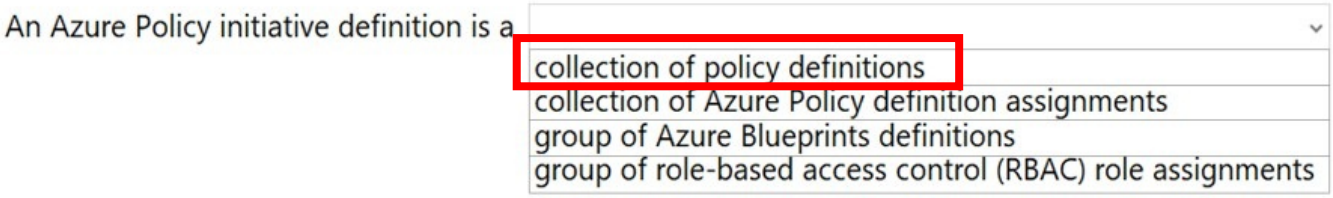

CertyIQ

HOTSPOT -

To complete the sentence, select the appropriate option in the answer area.

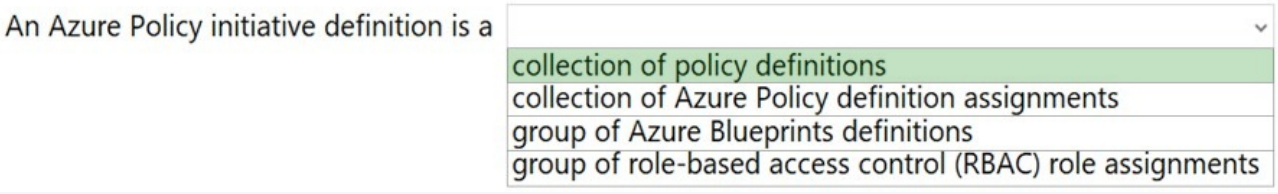

Hot Area:

Answer Area

Answer:

Answer Area

Explanation:

"collect of policy definitions" is the answer.

https://learn.microsoft.com/en-us/azure/governance/policy/overview#initiative-definition

An initiative definition is a collection of policy definitions that are tailored toward achieving a singular overarching goal. Initiative definitions simplify managing and assigning policy definitions. They simplify by grouping a set of policies as one single item. For example, you could create an initiative titled Enable Monitoring in Microsoft Defender for Cloud, with a goal to monitor all the available security recommendations in your Microsoft Defender for Cloud instance.

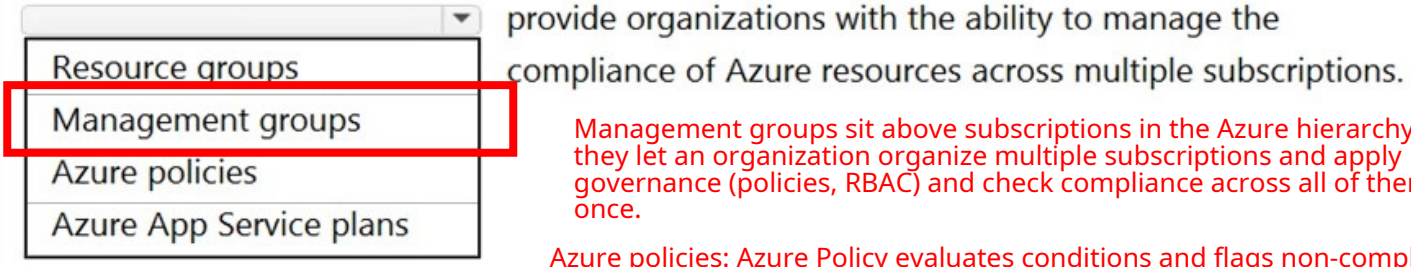

Reference:

https://docs.microsoft.com/en-us/azure/governance/policy/overview

Question: 299 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

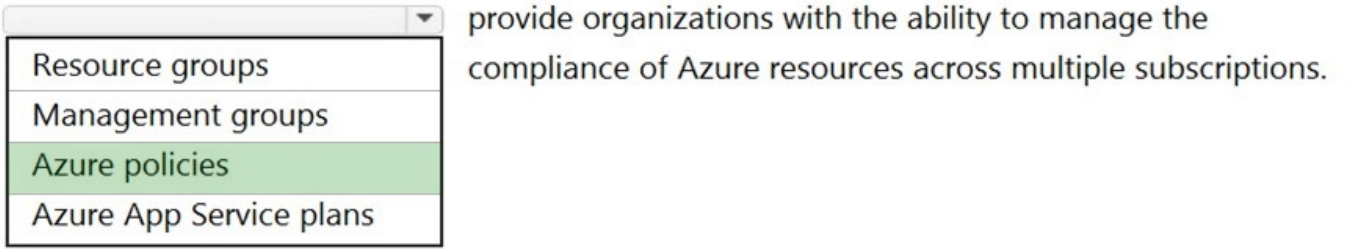

Management groups sit above subscriptions in the Azure hierarchy, so they let an organization organize multiple subscriptions and apply governance (policies, RBAC) and check compliance across all of them at once.

Azure policies: Azure Policy evaluates conditions and flags non-compliance, but policies themselves are applied at a scope. Without the scope container (Management groups), you cannot aggregate and govern across multiple subscriptions.

Answer:

Answer Area

Explanation:

"If your organization has many subscriptions, you may need a way to efficiently manage access, policies, and compliance for those subscriptions. Azure management groups provide a level of scope above subscriptions. You organize subscriptions into containers called "management groups" and apply your governance conditions to the management groups. All subscriptions within a management group automatically inherit the conditions applied to the management group. Management groups give you enterprise-grade management at a large scale no matter what type of subscriptions you might have.....

For example, you can apply POLICIES to a management group that limits the regions available for virtual machine (VM) creation. This policy would be applied to all management groups, subscriptions, and RESOURES under that management group by only allowing VMs to be created in that region."

Reference:

https://docs.microsoft.com/en-us/azure/governance/policy/overview

https://docs.microsoft.com/en-us/azure/governance/management-groups/overview

Question: 300 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
General Data Protection Regulation (GDPR) defines data protection and privacy rules.	○	○
General Data Protection Regulation (GDPR) applies to companies that offer goods or services to individuals in the EU.	○	○
Azure can be used to build a General Data Protection Regulation (GDPR)-compliant infrastructure.	○	○

Answer:

Answer Area

Statements	Yes	No
General Data Protection Regulation (GDPR) defines data protection and privacy rules.	○	○
General Data Protection Regulation (GDPR) applies to companies that offer goods or services to individuals in the EU.	○	○
Azure can be used to build a General Data Protection Regulation (GDPR)-compliant infrastructure.	○	○

Explanation:

Reference:
https://azure.microsoft.com/en-gb/blog/new-capabilities-to-enable-robust-gdpr-compliance/

Question: 301

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area: Statement 1 (Yes): An Azure Blueprint definition is composed of artifacts. Azure Blueprints supports four distinct artifact types:

Role Assignments

Policy Assignments

Azure Resource Manager (ARM) templates

Resource Groups

Statement 2 (No): Blueprint definitions can be saved at the Management Group or Subscription level, and a blueprint assignment can only be assigned to a Subscription (or management group). You cannot target or assign a blueprint definition directly to a Resource Group scope.

Statement 3 (Yes): Because Role Assignments are a supported artifact type within Azure Blueprints, blueprint definitions can be configured to grant specific Azure RBAC roles/permissions to users, groups, or service principals on resources or resource groups created by the blueprint.

Answer Area

Statements	Yes	No
You can add an Azure Resource Manager template to an Azure blueprint.	○	○
You can assign an Azure blueprint to a resource group.	○	○
You can use Azure Blueprints to grant permissions to a resource.	○	○

Answer:

Answer Area

Statements	Yes	No
You can add an Azure Resource Manager template to an Azure blueprint.	○	○
You can assign an Azure blueprint to a resource group.	○	○
You can use Azure Blueprints to grant permissions to a resource.	○	○

Explanation:

Reference:

https://docs.microsoft.com/en-us/azure/governance/blueprints/overview

Based on https://docs.microsoft.com/en-us/azure/governance/blueprints/overview

Y: Each blueprint can consist of zero or more ARM template artifacts. This support means that previous efforts to develop and maintain a library of ARM templates are reusable in Azure Blueprints.

N:Create a new resource group for use by other artifacts WITHIN the blueprint. When creating a blueprint definition, you'll define where the blueprint is saved. Blueprints can be saved to a management group or subscription that you have Contributor access to. If the location is a management group, the blueprint is available to assign to any child subscription of that management group. Each Published Version of a blueprint can be assigned (with a max name length of 90 characters) to an existing management group or subscription.

Y:The blueprint definition permissions must be granted or inherited on the management group or subscription scope where it is saved --> Meaning this would grant permissions to the resources

Question: 302

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer:

Explanation:

https://learn.microsoft.com/en-us/azure/china/overview-operations

Microsoft Azure operated by 21Vianet (Azure China) is a physically separated instance of cloud services located in China. It's independently operated and transacted by Shanghai Blue Cloud Technology Co., Ltd. ("21Vianet"), a wholly owned subsidiary of Beijing 21Vianet Broadband Data Center Co., Ltd..

https://learn.microsoft.com/en-us/azure/azure-government/documentation-government-welcome

US government agencies or their partners interested in cloud services that meet government security and compliance requirements, can be confident that Microsoft Azure Government provides world-class security and compliance. Azure Government delivers a dedicated cloud enabling government agencies and their partners to transform mission-critical workloads to the cloud. Azure Government services can accommodate data that is subject to various US government regulations and requirements.

Reference:

https://docs.microsoft.com/en-us/azure/china/overview-operations https://docs.microsoft.com/en-us/azure/azure-government/documentation-government-welcome

Question: 303 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
An Azure resource can have multiple Delete locks.	○	○
An Azure resource inherits locks from its resource group.	○	○
If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.	○	○

Statement 1 (Yes): Multiple locks can be applied to the same resource. You can create multiple locks of the same type (e.g., several CanNotDelete / Delete locks created by different administrators or automation processes with different notes/names) on a single resource.

Statement 2 (Yes): In Azure Resource Manager, locks are hierarchical and inherited. When a lock is applied at a parent scope (Subscription or Resource Group), all child resources under that scope automatically inherit the lock.

Statement 3 (Yes): You can apply multiple locks of different types to the same resource. If a resource already has a ReadOnly lock, you can still add a CanNotDelete (Delete) lock to it. When both types are present, the most restrictive lock (ReadOnly) takes precedence for effective operations.

Answer:

Answer Area

Statements	Yes	No
An Azure resource can have multiple Delete locks.	○	○
An Azure resource inherits locks from its resource group.	○	○
If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.	○	○

Explanation:

An Azure resource can have multiple Delete locks.

Yes.

In Azure, you can apply multiple locks to a resource. However, only one lock of each type (ReadOnly, CanNotDelete) can be applied to a resource. So, while you can have multiple locks, they must be of different types.

An Azure resource inherits locks from its resource group.

Yes.

Azure resources inherit locks from their parent resource groups. If a resource group has a lock, all resources within that group will inherit the same lock unless explicitly overridden.

If an Azure resource has a Read-only lock, you can add a Delete lock to the resource.

Yes.

You can add a Delete lock (CanNotDelete) to a resource that already has a Read-only lock. The Read-only lock prevents modifications, while the Delete lock prevents deletion. They serve different purposes and can coexist.

Question: 304 CertyIQ

Your company plans to migrate all on-premises data to Azure.
You need to identify whether Azure complies with the company's regional requirements.
What should you use?

A. the Knowledge Center
B. Azure Marketplace
C. the MyApps portal
D. the Trust Center

Microsoft Trust Center: The Trust Center is an informational portal that provides in-depth resources, documentation, and whitepapers regarding how Microsoft implements and supports security, privacy, compliance, and transparency.

It houses detailed information on global, government, industry-specific, and regional compliance standards (such as GDPR in Europe, HIPAA/FedRAMP in the US, or region-specific data sovereignty frameworks), allowing organizations to verify whether Azure satisfies their local regulatory requirements before migration.

Answer: D

Explanation:
Azure has more than 90 compliance certifications, including over 50 specific to global regions and countries, such as the US, the European Union, Germany,
Japan, the United Kingdom, India and China.
You can view a list of compliance certifications in the Trust Center to determine whether Azure meets your regional requirements.

Reference:
https://azure.microsoft.com/en-gb/overview/trusted-cloud/compliance/ https://docs.microsoft.com/en-us/microsoft-365/compliance/get-started-with-service-trust-portal

Question: 305 CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statement 1 (No): Authorization to Azure resources via Azure Role-Based Access Control (Azure RBAC) can be assigned to security principals other than individual user accounts. Valid security principals include Security Groups, Service Principals (applications), and Managed Identities (Azure services accessing other Azure resources).

Statements	Yes	No
Authorization to access Azure resources can be provided only to Azure Active Directory (Azure AD) users.	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Statement 2 (Yes): Microsoft Entra ID (formerly Azure Active Directory) supports hybrid and federated identity models. Users synchronized from on-premises Active Directory Domain Services (AD DS) via Microsoft Entra Connect/Cloud Sync, as well as external identities federated from third-party identity providers (e.g., Google, SAML/WS-Fed IdPs, social accounts via Entra External ID/B2B), can be granted access to Azure resources.

Answer: Statement 3 (Yes): Microsoft Entra ID provides identity verification (authentication), and Azure Role-Based Access Control (Azure RBAC) handles granular permission enforcement (authorization) directly within the Azure platform (via Azure Resource Manager).

Answer Area

Statements	Yes	No
Authorization to access Azure resources can be provided only to Azure Active Directory (Azure AD) users.	○	○
Identities stored in Azure Active Directory (Azure AD), third-party cloud services, and on-premises Active Directory can be used to access Azure resources.	○	○
Azure has built-in authentication and authorization services that provide secure access to Azure resources.	○	○

Explanation:

Box 1: No -
Authorization to access Azure resources can be provided by other identity providers by using federation. A commonly used example of this is to federate your on- premises Active Directory environment with Azure AD and use this federation for authentication and authorization.

Box 2: Yes -
As described above, third-party cloud services and on-premises Active Directory can be used to access Azure resources. This is known as 'federation'.
Federation is a collection of domains that have established trust. The level of trust may vary, but typically includes authentication and almost always includes authorization. A typical federation might include a number of organizations that have established trust for shared access to a set of resources.

Box 3: Yes -
Azure Active Directory (Azure AD) is a centralized identity provider in the cloud. This is the primary built-in authentication and authorization service to provide secure access to Azure resources.

Reference:
https://docs.microsoft.com/en-us/azure/active-directory/hybrid/whatis-fed https://docs.microsoft.com/en-us/azure/active-directory/develop/authentication-scenarios

Question: 306 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:

Answer Area

If a resource group named RG1 has a delete lock, [ ] can delete RG1.

- only a member of the global administrators group
- the delete lock must be removed before an administrator
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Answer:

Answer Area

If a resource group named RG1 has a delete lock, [ ] can delete RG1.

- only a member of the global administrators group
- the delete lock must be removed before an administrator
- an Azure policy must be modified before an administrator
- an Azure tag must be added before an administrator

Explanation:
You can configure a lock on a resource group to prevent the accidental deletion of the resource group. The lock applies to everyone, including global administrators. If you want to delete the resource group, the lock must be removed first.
As an administrator, you may need to lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources. You can set the lock level to CanNotDelete or ReadOnly. In the portal, the locks are called Delete and Read-only respectively.
➪ CanNotDelete means authorized users can still read and modify a resource, but they can't delete the resource.
ReadOnly means authorized users can read a resource, but they can't delete or update the resource. Applying this lock is similar to restricting all authorized
▪ users to the permissions granted by the Reader role.

Reference:
https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-lock-resources

Question: 307 CertyIQ

HOTSPOT -
Select the answer that correctly completes the sentence.
Hot Area:

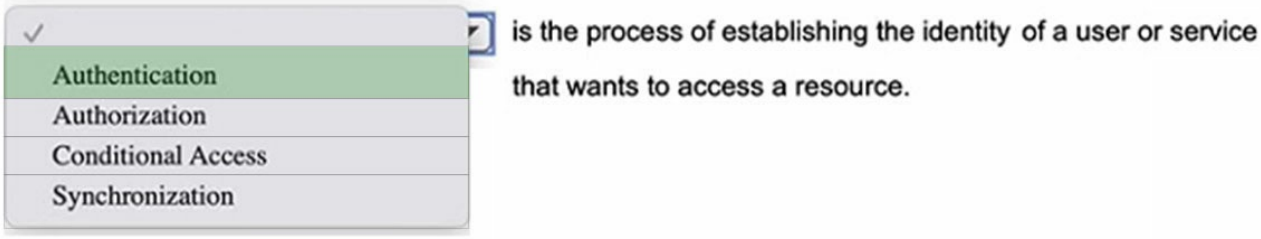

Answer Area

[ ] is the process of establishing the identity of a user or service that wants to access a resource.

- Authentication
- Authorization
- Conditional Access
- Synchronization

Answer:

Answer Area

Question: 308

CertyIQ

HOTSPOT -
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.
Hot Area:

Answer Area

Statements	Yes	No
Single sign-on (SSO) requires that all users sign in by using the Microsoft Authenticator app.	○	○
Authentication is the process of establishing which level of access an authenticated user or service has.	○	○
Conditional Access uses signals collected from a user during the sign-in process to decide whether to allow or deny access requests.	○	○

Answer:

Answer Area

Statements	Yes	No
Single sign-on (SSO) requires that all users sign in by using the Microsoft Authenticator app.	○	○
Authentication is the process of establishing which level of access an authenticated user or service has.	○	○
Conditional Access uses signals collected from a user during the sign-in process to decide whether to allow or deny access requests.	○	○

Explanation:
Single sign-on is an authentication method that allows users to sign in using one set of credentials to login across applications. Single sign-on makes it easier to manage passwords and increases security capabilities.
Authorization is the process of establishing what level of access a legitimate user or service should have.
During sign-in, Conditional Access collects signals from the user, makes decisions based on those signals, and

then enforces that decision by allowing or denying the access request or challenging for a multifactor authentication response.

https://docs.microsoft.com/learn/modules/secure-access-azure-identity-services/3-what-is-azure-active-directory https://docs.microsoft.com/learn/modules/secure-access-azure-identity-services/2-compare-authentication-authorization https://docs.microsoft.com/learn/modules/secure-access-azure-identity-services/4-what-are-mfa-conditional-access

Question: 309 CertyIQ

What is guaranteed in an Azure Service Level Agreement (SLA) for virtual machines?

A. uptime
B. feature availability
C. bandwidth
D. performance

Microsoft SLAs formally define the performance standards and commitments for Azure services. For Azure Virtual Machines, the SLA guarantees a percentage of monthly uptime and connectivity (ranging from 99.5% for a single VM with standard HDD up to 99.99% for multi-AZ deployments), with Service Credits issued if the uptime falls below the threshold.

SLAs do not guarantee application-level responsiveness, sustained network throughput/bandwidth, compute processing performance, or future feature roadmaps.

Answer: A

Explanation:
The SLA for virtual machines guarantees 'uptime'. The amount of uptime guaranteed depends on factors such as whether the VMs are in an availability set or availability zone if there is more than one VM, the distribution of the VMs if there is more than one or the disk type if it is a single VM.
The SLA for Virtual Machines states:
✑ For all Virtual Machines that have two or more instances deployed across two or more Availability Zones in the same Azure region, we guarantee you will have
Virtual Machine Connectivity to at least one instance at least 99.99% of the time.
✑ For all Virtual Machines that have two or more instances deployed in the same Availability Set or in the same Dedicated Host Group, we guarantee you will have Virtual Machine Connectivity to at least one instance at least 99.95% of the time.
✑ For any Single Instance Virtual Machine using Premium SSD or Ultra Disk for all Operating System Disks and Data Disks, we guarantee you will have Virtual
Machine Connectivity of at least 99.9%.

Reference:
https://azure.microsoft.com/en-us/support/legal/sla/summary/
https://azure.microsoft.com/en-us/support/legal/sla/virtual-machines/v1_9/

Question: 310 CertyIQ

HOTSPOT -
To complete the sentence, select the appropriate option in the answer area.
Hot Area:
